Sculpture

At the outset of the decade 1937–46, sculpture was still suffering from lack of appreciation; the struggles of sculptors for recognition, especially the younger artists who were experimenting with new ideas, were great. Art critics gave very little notice to sculpture, and art magazines contained few reproductions. For some unexplained reason, critics often completely ignored sculpture when exhibited in conjunction with painting. No wonder, therefore, that the public responded slowly.

The situation, however, changed greatly during the ensuing ten years, and great forward strides in sculpture were made. In the United States, many new sculptors, with opportunities formerly nonexistent, came to the fore. The public generally became more conscious of this art form and gradually introduced it into the home as an intrinsic element of the decorative scheme. Architects co-operated more widely with sculptors; museums gave more importance to exhibitions of sculpture; and, with the advent of the federal art projects and government sponsorship, sculpture received a new impetus which would have continued had World War II not intervened. The United States seemed to lead in this development; little news concerning sculpture came from Europe. After Aristide Maillol, Charles Despiau, Constantin Brancusi, Jacques Lipschitz, Ossip Zadkine, Jacob Epstein and Henry Moore, there had not been many new men whose work was known, and these sculptors retained their position of eminence. Their influence was world-wide and was felt in the works of most of the new sculptors. Wilhelm Lehmbruck's influence also lived, although this great German artist died shortly after World War I.

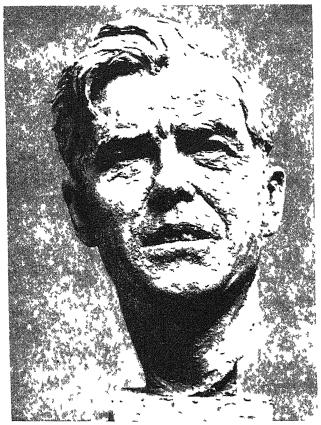

The increasing number of sculptors who cut directly into the material, sometimes without any preconceived ideas, brought about great changes during the decade. This

Eventful Years

approach led to more solidity and a more sculpturesque quality, together with more individuality and greater depth. Experiments were made with new plastic materials Sculptors returned more and more to cutting directly in marble, stone and wood, "cherchant dans la matière." They also built and modelled in plaster. These trends to a great extent initiated a style directed more toward the simplification of forms and abstraction, thus departing from too close a reproduction of nature, which in turn gave their work a more personal quality. Thus, the sculptors' approach separated them more and more from the surface manipulation and the splashy style of Auguste Rodin and Antoine Bourdelle, whose influence almost disappeared during the decade.

Work of Individual Sculptors.—A great loss was the death in 1944 of Maillol, one of the greatest sculptors of his time. Maillol's forms were concise, sensuous, smooth and well-rounded. He understood simplification, and his style showed his great admiration for the ancients. His drawings were wonderful expressions of a sculptor's approach in that medium. Maillol's memorial to Paul Cézanne, his titanic "Action in Chains," "Ile de France," "Venus," "Pomona," "The Mediteiranean" and his war memorials were his great works.

Despiau, another great French sculptor, differed from Maillol in that he was much more interested in portraiture. In this accomplishment he was unique and was perhaps one of the greatest portrait sculptors of his period. Although portiaiture comprised the bulk of his work, he also did full figures. "Eve" stands out as one of his finest—a very beautiful, simple, sensitive figure of a girl standing erect with legs apart. Among his later portraits, that of Antoinette Schulte has power and is a good likeness. Despiau had a knack for getting likenesses. Although

Bust of Henry A. Wallace modelled from life by Jo Davidson in 1942

his work has the appearance of spontaneity, it was the result of long and arduous work. Earlier portraits, such as "Portrait de Mme S," "Maria Lani," "Madame André Derain," are among his finest They are austere, laboriously modelled, but always surprisingly fresh.

Henri Laurens worked mostly in the abstract, and Naum Gabo introduced new ideas and materials in his abstractions.

Lipschitz and Zadkine, connected with L'École de Paris, were both in the United States during World War II. Their visit was a great stimulus to the sculptors of that country, both young and old Lipschitz's interesting interpretations of "Europa" and his drawings remained a cachet of his visit. Zadkine's "Prometheus' struggling with the eagle, leaned toward abstraction. One of his later works, "La Prisonnière," was an outstanding achievement, an imprisoned torso, inspired by World War II, represented all the occupied countries. This sculptor's style was uniquely his own.

Georg Kolbe remained the outstanding German sculptor after the death of Lehmbruck. His work was done mostly in clay and cast in bronze, he was brilliant in handling this material. Many of his figures, caught in action, are very alive with a free technique recalling Rodin's style Kolbe, in that sense, remained closer to nature. His "Grosser Wachter" (1937), of a kneeling man with a bow, was considered among his best works.

Ernst Barlach was influenced strongly by the early German wood sculpture. His figures generally have a pleasing rhythm with solid forms. Rence Sintenis did interesting animal sculptures. Gerhardt Marck's work was in the primitive trend. William Ehrich, who moved to the United States in 1929, worked interestingly in wood.

Chana Orloff, the Russian sculptor, exhibited in New York. Her style shows individuality, "Girl With Basket" is interestingly simple, but her "Maria Lani" is less profound than Despiau's interpretation of the same.

Moore, at his best, was reminiscent of Pablo Picasso's 'Dinard Period of 1928" and also his "Bone Period" Moore's drawings were entertaining and showed more originality than his sculpture Eric Gill was another accomplished British artist of the decade.

In the United States, several sculptors of merit appeared John B Flanagan worked largely in hard natural stones, cutting not very deeply into the material but profiting by allowing the shape of the stone to suggest his subjects. Thus he obtained a primitive effect, and his elongated forms often resemble the manner of Lehmbruck His animal sculptures were considered among his best. One of his last works was a figure in limestone made for the Ellen Phillips Samuel memorial in Philadelphia

Jose de Creeft was also an important and prolific artist in this period, exhibiting almost every season. He made use of the odd shapes of materials such as marble and stone, and also worked successfully in hammered lead. Among his later pieces in taille directe, "The Kiss," is an excellent example, as are also the earlier works, "Head," in black Belgian granite, and "Maternity," which won the first prize in the Artists For Victory exhibition at the Metropolitan Museum of Art in 1942.

William Zorach worked mostly in marble, stone and wood, occasionally using clay. He was at his best when cut ting directly, and his "Mother and Child" remained one of his best known pieces. Also memorable works were "The Dance," cast in aluminum and placed in Radio City music hall, and his later "Head of Christ" in black granite, in the collection of the Museum of Modern Art

Chaim Gross, a younger man, worked in lignum vitae and other woods usually, although he also used marble and stone. The figures are arbitrarily short and bulky, constituting a style of his own. His acrobats, generally two or three figures standing or riding on each others' shoulders, were subjects that brought him renown. Gross received the second prize in the Artists For Victory exhibition in 1942.

Oronzio Malderelli cut directly into the material and also worked in plaster. He was among the leaders doing strong, monumental work. A simplified head of a girl in stone received a prize at the Chicago Art institute

David Smith, at one time an iron founder, worked inter estingly in steel, zinc and copper. His former trade influenced him and made him very adept at forging his own creations and achieving unique patina.

Alexander Calder made a special place for himself in the art world. His "mobiles" are abstract, moving forms in wire, steel, wood and other materials, frequently introducing colour. Some of them were used successfully in scenic designs for the theatre. Calder was an exhibitor at the Museum of Modern Art, in which collection he was well represented.

Epstein, an American who lived mostly in Great Britain, gave the art world some exciting moments. Two of his later works were "Adam," an over life size figure in pink alabaster, and "Jacob and the Angel," also in alabaster. An earlier work, "Mother and Child," in marble and owned by the Museum of Modern Art, suggests the sculpture of Amedeo Modigliani

Heinz Warnecke did interesting animal sculpture and also greatly simplified figures such as the "Prodigal Son"

Turku Trajan received full recognition of his work only during the decade and was somewhat different from most

Detail from "Jacob and the Angel," a work in alabaster by Jacob Epstein, based on the Old Testament story, which was exhibited in London in 1942

sculptors in that he refused to be limited by what he claimed to be the almost universal tendency considering the material of prime importance. Trajan had a strong inner conviction in regard to sculpture and strove for deep spiritual expression. He worked in keen cement and plaster, and has frequently colour. His "Fallen Angel," was considered one of his best pieces.

Alfeo Faggi worked in clay Of his earlier works, 'Eve" and "Pieta" remained among the best as did his portraits of Rabindranath Tagore and Noguchi

Concetta Scaravaglione was outstanding among the women sculptors. Her 'Girl with Gazelle' is marked by an individual style. Lu Duble was another talented woman sculptor whose "Calling the Loa Haiti' shows movement and is distinctly personal Minna Haikavy also accomplished work of note

Cornelia Chapin, an animal sculptor with a good sense of design, reminded one at times of the French animal sculptor, François Pompon Saul Baizerman hammered coppers and beaten metals

Raoul Hague, among the late discoveries, did splendid work in stone, winning the Audubon first prize for sculp ture in 1945 John Rood, who worked in wood, showed great technical ability and was very productive Ronald Kraus, whose "Justice," completed under the treasury art project for the Newark federal court house, won him success, received the sculpture prize at the Golden Gate International Exposition in 1939 Kraus modelled chiefly in clav

Alexander Archipenko worked in many materials and was one of the first abstractionists. His "Moses" a symbolic figure, became well known. Mahonri Young's sporting subjects made him familiar to many. Richmond Barthe was accepted as the foremost Negro sculptor, and held a prominent place in this field of art.

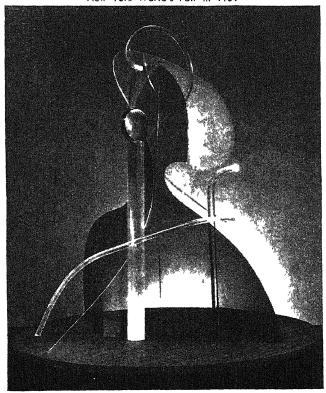

Hugo Robus worked in smooth, simplified forms Woman Combing Her Hair' was considered one of his best Louis Slobodkin also remained in the front rank his fine Lincoln' was a source of considerable contro versy. Henry Kreis achieved recognition for his work in stone, of which one of the best was 'Woman With Violin' He worked under the federal art project in Washington, DC

Lee Laurie's large figure of "Atlas" on Fifth avenue in front of Radio City shows Assyrian influence Carl Milles's fountains and colossal figures kept his name before the public. He acquired a wide reputation as a teacher.

Isamo Noguchi, another outstanding sculptor, worked for Radio City music hall in an interesting style. Other sculptors who gained prominence during this period were Carl Schmitz, Charles Rudy, Bertha Margoulies, John Hovannes Anita Weschler Anthony de Francisci Simon Moselsio. Ben-Schmuel Harold Cash, Albino Cavallito, Vincent Glinsky Mitzi Solomon, Paul Fiene. Jean de Marco, Maurice Glickman. Ruben Nakian and Warren Wheelock.

Competitions and Exhibitions.—The New York World's Fair in 1939 proved a great incentive to sculptors. Many were given a chance for the first time to work on a large scale the results were surprisingly good. Through the fed eral art projects some of the younger men achieved their first success. Many well known sculptors were represented at the fair. Paul Manship's "Time and the Fates of Man" held a central position, Gaetaro Cecere had two very successful over life size groups, James Earle Fraser's colossal "Washington," and works by Zorach. Leo Friedlander. Ed mond Amateis and others, were exhibited. The French building had a fine collection of sculpture containing work.

Alexander Calder's 'Stabile' an abstraction in Plexiglas which won first prize in a national competition and was exhibited at the New York World's Fair in 1939

by Maillol and Despiau. Latin-America's exhibit was interesting in some instances, and Cuba was represented by Fernando Boada's excellent "Head."

The plexiglas competition for the Hall of Industrial Science at the fair created an interesting experience for sculptors in that it introduced a new material. More than 200 artists entered the competition. The jury consisted of Katherine S. Dreier, James Johnson Sweeney and Robert Laurent. First prize went to Calder for an interesting piece in this transparent plastic. Other winners were Herman Matter and Werner Drewes.

Still another great opportunity for sculptors was the Golden Gate International Exposition in San Francisco.

In 1939 attempts were made to popularize sculpture by reproduction. Limited editions of small pieces in cast stone, plaster and terra cotta were introduced. The prices ranged from \$15 to \$100. These enterprises worked fairly well, and probably would have continued had it not been for the small return to the artists. The list of names included such men as: Warren Wheelock, Oronzio Malderelli, Zorach, De Creeft, Laurent, Gross, Flanagan, Polygnoto Vagis, Scaravaglione, Dorothy Greenbaum and Maurice Glickman.

Glass was tried also as a material and was used by some factories as an experiment in reproducing sculpture within the range of the ordinary citizen's pocketbook.

One of the outstanding events during the decade was the second Out-Door exhibition held in 1940 at the Philadelphia Museum of Art under the sponsorship of the Ellen Phillips Samuel memorial. This very ambitious sculptural project along the Schuylkill river in Fairmount park extended over a period of many years. It was of great importance to the advancement of modern sculpture and was representative of works from all schools and from all parts of the world. Commissions were awarded for monuments commemorating events in the history of the U.S. Those for the first two principal groups were given to Gaston Lachaise and Laurent respectively.

Lachaise, one of the foremost sculptors of his day, had been given the subject "Welcoming the Peoples." He died while still working on the sketch, a model of which was cast in bronze for the Philadelphia museum. "Standing Woman" by Lachaise, a cast of which was placed in the collection of the Whitney Museum of American Art, was acknowledged as an important contribution to sculpture by critics and connoisseurs alike. He was given a one-man exhibition at the Museum of Modern Art and was one of the three sculptors included in the "Pioneer Exhibition," held in the spring of 1946 at the Whitney museum, the other two being Zorach and Laurent.

After the untimely death of Lachaise, the commission went to Maurice Sterne, who was known as a painter but worked in sculpture as well. His "Awakening," a figure in bronze, was an outstanding example of his work. This commission, together with Laurent's "Spanning the Continent," comprise two over-life-size groups cast in bronze, and were placed on an exedra along the Schuylkill. Other sculptors who later received commissions for this memorial were: Warnecke, J. Wallace Kelly, Helene Sardeau, Flanagan and Wheeler Williams. Among the exhibitors from Europe in this Out-Door exhibition were such important sculptors as: Barlach, Brancusi, Ernesto de Fiori, Despiau, Epstein, Kolbe, Lipschitz, Maillol, Zadkine, Pablo Gargallo, Sintenis and Henri Matisse, the famous French painter who did interesting quick sketches in sculpture, as other painters had done in the past-notably Pierre Auguste

Renoir, Hılaire Degas, and, later, Modigliani and Picasso.

In 1941 the International Business Machines corporation made a selection of sculptures typifying that art in the western hemisphere. The Latin-American countries, Canada, the United States and its possessions were all represented. This selection was added to the permanent collection of I.B.M. Each country in Latin America was represented generally by two sculptors, and many of the pieces were in wood. Among the interesting artists were Agustín Riganelli, Marina Nuñez Del Prado, Maria Maitins and Francisco Naivaez. Canada was represented by ten sculptors, including Don Stewart, whose "The Dancer" in terna cotta was noteworthy, as was Sheila Wherry's "Mother and Child" in plaster. The United States's exhibitors included such artists as Arnold Ronnebeck, Paul Hyun, Robert Davidson, Reuben Kramer, Laurent, Charles Cutler, Waylande Gregory, Ben Schmuel, Simon Moselsio, Dan Olney and Marie Louise Felden.

In 1944 an exhibition was shipped to Britain to illustrate "The Art of Today" in the United States. This was a major undertaking during wartime, and because of the difficulties of transportation, only small pieces were accepted. Approximately 50 sculptors were included, covering all schools and directions, from Fraser to Robus. The jury of selection consisted of Archipenko, Manship and George Lober. Before being shipped, the group was exhibited in New York city.

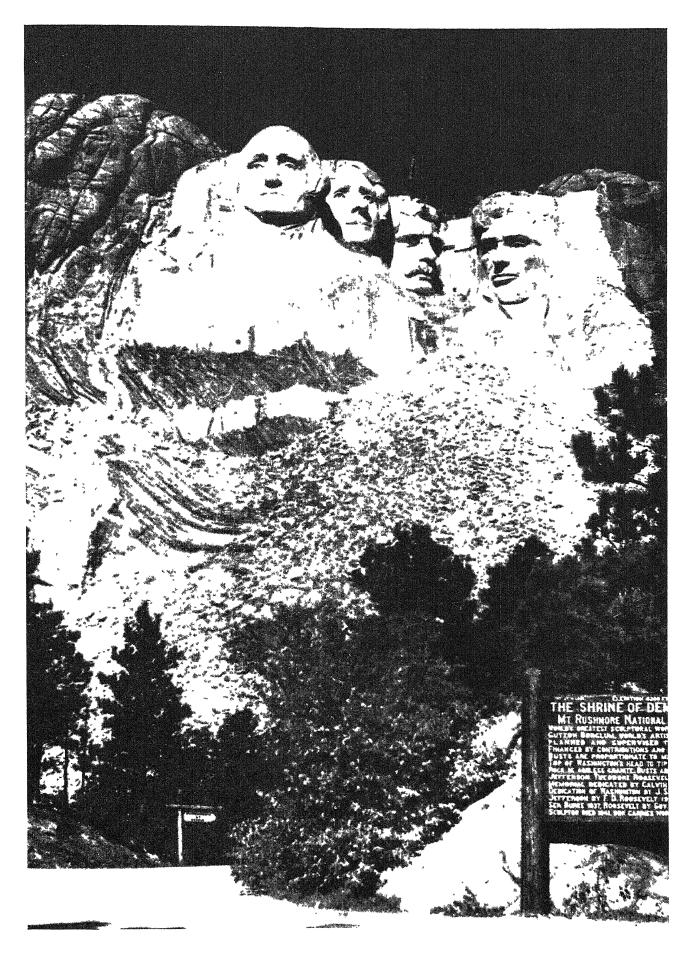

Many other competitions in sculpture took place during this period, including that of the Metropolitan Life Insurance company and those of the "Artists-For-Victory."

The Sculptors' guild, a society numbering among its members most of the younger group, attracted much attention by holding outdoor exhibitions in New York City. Its members employed *taille directe*. Their exhibitions kept abreast of the latest trends in sculpture during the decade.

Museums, as well as universities, became more interested in exhibitions of sculpture. The Whitney Museum of American Art had always welcomed new talent, and many young sculptors experienced their first success there. The museum's permanent collection was very representative of the new movement in sculpture. The Museum of Modern Art was interested chiefly in the ultramodern sculptors, and its superb collection embraced works done in Europe as well as the western hemisphere. The Philadelphia Museum of Art, the Corcoran Gallery in Washington, D.C., the Albright Art Gallery in Rochester, N.Y., the Brookgreen Gardens, S.C., the Carnegie institute in Pittsburgh, together with others, aided the development of sculpture during the period.

Among the colleges and universities which contributed to the general interest was Indiana university where, in the fall of 1944, an exhibition of sculpture was held showing the work of Maillol, Despiau, Gross, Lipschitz, Zorach, Laurent, Lehmbruck, Flanagan, Kolbe, Lachaise and Barlach. In the spring of 1946, Yale university exhibited contemporary sculpture showing the variety of activities in this field. Many of the pieces shown were early works by well-known artists; also, later works by Zadkine, Lipschitz, Smith, and some excellent abstractions by Anton Pevsner done in celluloid, copper and zinc. Pevsner's "Torso" was entertaining with its curved transparent planes. He also showed a portrait of Marcel Duchamp. Many of the items had been presented to the university by Miss Dreier and

The last of the giant stone faces of four American presidents—that of Theodore Roosevelt—was unveiled on Mount Rushmore, South Dakota, July 2, 1939. Gutzon Borglum, the sculptor, died in 1941

Duchamp the latter having done interesting wire sculpture besides making a name for himself at the time of the armory show with his famous painting, "Nude Descending The Staircase"

Another experiment which made the US public more sculpture conscious was the yearly (except for the war years) open competitions in soap sculpture sponsored by Procter and Gamble Every exhibition had several thousand entries and started many young artists trying their talent at cutting directly into some material

Thus, the decade 1937–46 witnessed an increasing appreciation of sculpture on the part of the general public, and the great productivity of the established artists, coupled with the emergence of so many new talents, helped to keep pace with the growing interest (See also Ari Exhibitions) (R Lt.)

Seabees

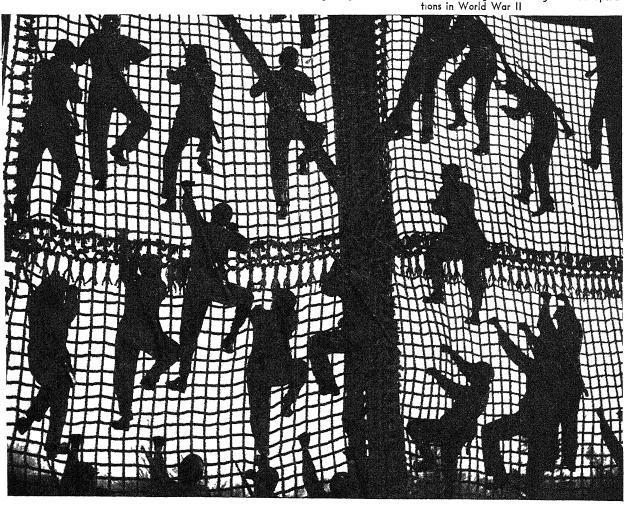

First authorized on Dec 28 1941, the US naval construction battalions, popularly known as the "Seabees," participated in every major amphibious operation of World War II, including the occupation of Japan and Japanese controlled areas in China.

Operating in basic units (1,082 men and 34 officers) sufficiently diversified to be completely self-contained and capable of performing any type of advance base construction work, the Seabees, trained construction men commanded by experienced officers of the Civil Engineer corps US navy and US naval reserve, built, operated and maintained more than 400 naval bases in outlying areas

In 1942 the construction efficiency of the Seabees was estimated to be in the ratio of five to one as compared with that of Japanese construction troops. By the end of the war, when 83% of the more than 240,000 Seabees on active duty were serving overseas, the construction potential of the average Seabee battalion had been increased by 300% over that of original battalions.

In addition to these construction battalions, special battalions were trained in stevedoring operations. Other battalions and detachments were organized to handle the navy's pontoons as causeways, barges and a variety of other uses. Still others specialized in truck operation, camouflage, automotive repair, demolition work, fog generation

Seabees climbing down a rope cargo net Such nets were used for getting soldiers overside on landing craft during invasion operations in World War II

and petroleum supply. When construction work had been completed, quarter-battalion-size maintenance units took charge, freeing construction battalions for other assignments.

In Europe the Seabees assisted in the construction of and manned the artificial harbour units, and operated pontoon "Rhino" ferries and causeways during the Allied invasion of France, as well as all invasions in the Mediterranean. They assisted in handling stores for the Allied armies over the open beaches of Normandy and southern France and participated in the restoration of damaged ports.

Starting westward from Guadalcanal on the south and the Aleutians in the north, Seabee construction projects mounted into the hundreds. Warehouses, hospitals, personnel structures, airfields, roads, harbours and fleet facilities were provided. Among the largest were those in the Marianas, Guam, Tinian and Saipan, taken in 1944 and completed by mid-1945. The field at Tinian, for example, could accommodate eight B-29s per minute for the bombing of Japan.

On all three islands vast networks of airfields were placed in operation, and supply and staging area facilities expanded.

On the small land area of Iwo Jima such construction was not possible. However, three airfields were built there. The largest of these, called Central airfield, had one of the longest runways in the Pacific—9,800 ft. Serving as an emergency landing point for bombers unable to return to the Marianas after sweeps over Japan, Central airfield during the closing months of the war was used by more than 5,000 B-29s.

The last major Seabee project of the war was the base at Okinawa. This was planned as the greatest single wartime construction undertaking in military history. Installations scheduled included 22 airfields and 1,100 miles of road.

Planned as a wartime organization, the Seabees were scheduled in 1946 to become a permanent branch of the peacetime navy. Plans called for the training of Seabees at Port Hueneme, Calif., for continued overseas advanced base assignments, and for the continued development of advance base type of materials and specialized construction techniques.

Secondary Metals

The salient features of the secondary metals industry in the U.S. during 1937-45 are shown in the accompanying table. In presenting these data, however, it should be emphasized that only recoveries from old scrap, discarded from the pool of metal in use, represent an increase in the available supply; the reworking of new scrap merely

reconditions for use such portions of new metal not yet in use as may have been discarded in the process of manufacture, and so makes no addition to the current supply.

Recoveries of Second	ary Metal	s in the Ur	uted State	es	
NONE	1937	1939	1941	1943	1945

*Other Platinum Metals. †Industrial uses only, with no reference to monetary uses. tranaces using scrap in making pig Iron or iron castings; total includes uses other than steel and iron furnaces.

World War II brought marked increases in the recovery of secondary metals. On the one hand, shortages in the supply of practically all important metals led to greater

activity in the collection and utilization of old scrap, and at the same time the greatly increased fabrication activity required by the war program inflated the amounts of plant scrap that had to be reworked to put it in shape for use.

Of these two factors, the latter was the greater with most metals, so that the ratio of plant scrap to old scrap was increased.

The table includes data on all of the metals for which secondary recoveries were reported. In addition to total recoveries, broken down according to whether the recovered metal is in the form of pure metal, alloys, or compounds, the total is also divided according to the amounts recovered from old or purchased scrap, and new or plant scrap.

And finally, in order to give the reader an idea of the relative importance of secondary recoveries in comparison with the production of the primary metal, there are added data on the magnitude of the primary industry.

The ideal figure for this comparison would be the consumption of the primary metal in question, but since consumption data were not available in all cases, the next best substitute was used; the first choice is mine production, but for some items smelter production must be used. Nickel was a special case, in which none of these data were at hand, nor was any other figure directly indicative of the demand for nickel; the best that could be done was to use the available supply, that is, domestic production, plus imports, less exports.

This figure is at fault in that it does not take into account changes in stocks, which were considerable during the years of World War II; furthermore, the published data on imports and exports were only approximate, in that they included the gross weights of any ore, matte or alloys, and not the nickel content, giving figures appreciably higher than the actual supply, but still the best approximation that could be made.

The major item in secondary metals is iron and steel scrap, three-quarters of which is used in the production of steel. The increased steel output demanded by the war program soon brought on a shortage of scrap, necessitating the use of more pig iron and less scrap in the steel furnaces.

While increased production activity expanded the supply of plant scrap, purchased scrap was short in supply and more than offset the increase in plant scrap. Purchased scrap decreased from 529 lb. per ton of steel made in 1937 to 406 lb. in 1944, while plant scrap increased from 594 lb. to 657 lb., giving a drop in total scrap used from 1,122 lb. to 1,062 lb., and necessitating an increase in pig iron used from 1,141 lb. to 1,207 lb.

The scrap content of the charge rose to 1,083 lb. in 1945, of which 450 lb. was purchased scrap—the highest ratio of purchased scrap used since 1939. In the first half of 1946 the scrap used rose to 1,138 lb., including 598 lb. of plant scrap and 540 lb. of purchased scrap, a ratio slightly better than that of 1937; this improvement, however, did not indicate a return to normal, but was the result of the disorganization of plant operations during the steel and coal strikes, and especially the shortage of pig iron caused by the latter strike.

By mid-1946 stocks of scrap had declined to a point even lower than in the critical year of 1941, and increased steel output to recoup strike losses was seriously handicapped.

Among the leading nonferrous metals it is significant to note the shift in form of recovery. While recoveries in the form of alloys doubled and redoubled, those as pure metal declined sharply in most cases.

Fabrication for war production created so much plant scrap that recoveries grew rapidly. Only in the cases of lead and tin did recoveries from old scrap keep ahead of those from new scrap.

After 1943 secondary recoveries turned back toward normal, as was evidenced by decreasing totals, and even more so by a trend toward an increase in the ratio of old scrap to new scrap; however, it was possible that some of this latter shift was due to increasing recoveries from used war materials.

There were also significant changes in the secondary recovery of the precious metals during World War II, responding to increased consumption. Because of their relatively high values, the recoveries of these metals were more complete and more prompt than with the cheaper nonferrous metals.

Especially striking were the increasing industrial uses of platinum, gold and silver, and their corresponding increases in secondary recovery.

And finally, the comparison of secondary and primary outputs as shown in the table, emphasize the great importance of the secondary recoveries as a factor in metal supply, and the magnitude of the conservation of mineral resources made possible through the commercialization of the junkpile.

Second World War

See WORLD WAR II.

Secret Service, U.S.

The United States secret service, treasury department, was established during the Civil War. Its major duties include the protection of the person of the president of the United States, the members of his immediate family and the president-elect; the protection of the White House and its grounds; the suppression of the counterfeiting and alteration of all government obligations; the protection (by the secret service uniformed force) of treasury buildings, money and securities; and the enforcement of other laws relating to the treasury department.

The ten years from 1937 to 1946 marked a new secret service trend in law enforcement, a trend toward the prevention of crime. In the early 1930s, counterfeit bills were circulating to the extent of nearly \$1,000,000 a year. Because the centre of big-time counterfeiting activity was in New York city, the secret service organized a special squad of carefully-selected agents to crack down on certain underworld "syndicates" known to be dealing extensively in counterfeit money. By shadowing, "roping" and tireless investigating, the agents traced and captured hundreds of makers, distributors and passers of fake notes and coins, and seized thousands of counterfeits before they could reach circulation. By 1937 losses to victims of counterfeits were considerably on the downward trend. To help protect potential victims, and to wage a more effective war on counterfeiting, the secret service devised new methodsnot to supplant, but to reinforce the enforcement techniques.

Thus the secret service crime prevention program was conceived and integrated with enforcement methods already in use.

Before 1937 it had been the policy of the secret service to give very limited publicity to new types of counterfeit money, lest the public become suspicious of all currency. As a result, few persons except bankers and police had any definite knowledge of what counterfeit money looked like, how to detect it, or what action to take if counterfeit

money was passed to them. The situation in 1937 convinced the secret service that by making the crime of counterfeiting difficult and dangerous to commit, the counterfeiter could be driven out of business.

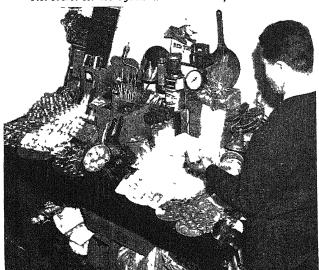

In the four-year period 1933-36, inclusive, losses suffered by victims of counterfeit bills had averaged about \$771,000 a year. In 1937 the first attempts were made to put merchants on the alert against the counterfeiter. Thousands of illustrated warning notices were distributed to show essential differences between counterfeit and genuine paper money, so that potential victims would know counterfeits when they saw them and could thus guard against bad money losses. In April 1938 a special corps of secret service agents centred prevention activities in New York city, long the hotbed of counterfeiting. They lectured to 93,000 business people assembled at 2,160 public meetings. They went from store to store, giving oral instruction to more than 100,000 retailers, and distributed about 900,000 warning notices. For the year ended June 30, 1938, losses to counterfeiters' victims dropped to \$519,000.

In the next fiscal year, 1939, the crime prevention work was broadened in an intensified nation-wide "Know Your Money" campaign. More warnings were distributed, and counterfeit-detection material was used effectively in radio broadcasts, newspapers, magazines, leaflets, posters and placards. At the close of that year, losses to victims of bogus bills had dropped to \$294,057—almost \$225,000 less than the 1938 losses. It was also during 1939 that efforts of the secret service resulted in a conference among representatives of the post office department, the Works Projects Administration and the treasury department, to improve methods of preparing and distributing government cheques and to prevent thefts and forgeries of such cheques.

In Jan. 1940 secret service personnel completed a sound motion picture called "Know Your Money," destined to be shown extensively in the nation's high schools, and to groups of bankers, storekeepers and other money handlers. The actions which had started as crime prevention skirmishes against the counterfeiter now became integrated in a purposeful secret service crime prevention program, which included the "Know Your Money" and "Know Your Endorser" campaigns, the latter directed against cheque thieves and forgers.

A 32-page booklet entitled "Know Your Money" was first published by the secret service in Sept. 1940. Filled

Part of the tools and equipment of a counterfeiter's shop seized by U.S. secret service agents in New York city in Jan. 1942

with enlarged photographs of genuine and counterfeit bills and coins, the booklet's text told in simple language the story of money, how to detect counterfeits, and how to avoid losses from forged cheques. By 1946 about 100,000 copies had been sold by the government printing office, and several hundred thousand were in use in more than 15,000 high schools, to which they were presented by the secret service for use as standard study courses.

Use of the booklet in high schools was in keeping with the long-range objectives of the secret service crime prevention program. The boys and girls graduating from secondary schools to enter the commercial world gained much practical knowledge about money from this study. They were preparing themselves to face the realities of business more confidently, and to become better citizens by helping to prevent crime and delinquency.

The "Know Your Money" campaign was endorsed by the U.S. office of education and the National Education association. Many publishers included counterfeit-detection material in standard school textbooks on civics, economics, history, problems of democracy and general business. Schools in various states held "Know Your Money" essay contests in which local banks or merchants furnished war bond prizes to high school students writing the best essays on the subject. In New York city the Chase National bank and Life magazine sponsored an impressive secret service exhibit at Rockefeller Center in 1942. Entitled "The Silent Saboteur," the display stressed the potential dangers of counterfeit money as a weapon of war. National advertisers produced merchandising displays on the backs of which they printed counterteit-detection material and warnings against specific issues of counterfeit bills. With the displays placed on store counters near cash registers, the warnings were thus readily available to merchants and cashiers. Transit companies in many towns and cities printed millions of street car and bus transfers bearing "Know Your Money" warnings, and thousands of instructive car cards were posted in subway trains, trolley cars and busses in big cities.

By 1943 the campaign was progressing favourably of its own momentum, and counterfeiting losses were less than \$29,000 for that fiscal year. However, cheque forgery became a growing problem, with the government sending more than 300,000,000 cheques a year to dependents of soldiers and sailors, to social security beneficiaries, to farmers, veterans and others. Forgery was another underworld business conducted for illicit profit, and the secret service attacked it by seeking to make it unprofitable and dangerous. Profiting by experience gained in the offensive against the counterfeiter, the "Know Your Endorser" campaign was intensified to defeat the forger.

Through secret service efforts, all government cheques were imprinted with the pertinent warning: "Know Your Endorser—Require Identification." Also, convinced that merchants and other money handlers should be on the alert against forgers of commercial cheques as well as government cheques, the secret service sought the co-operation of private business in having the "Know Your Endorser—Require Identification" inscription printed on commercial and personal cheques. The response was overwhelming. Life insurance companies, auto manufacturers and other industrialists, state, county and municipal governments, chain stores and independent business men, makers of safety paper for cheques, and other organizations printed the warning on millions of cheques. As in the "Know Your Money" campaign, newspaper and

magazine articles, hundreds of radio broadcasts, pamphlets, posters, placards and educational exhibits played an important part in putting potential victims of the cheque forger on guard against him. Printed warnings were sent with cheques to persons who received government cheques by mail, cautioning them to foil mail thieves by getting cheques upon delivery and by keeping mail boxes locked. A large insurance company co-operated by producing a motion picture in colour, called "Check and Double Check," and another on counterfeiting, entitled "Doubtful Dollars," and presented several prints to the secret service for use in both campaigns. Public utility companies, department stores and banks promoted and exhibited educational displays designed to make money-handlers cheque-

conscious and counterfeit-conscious. Secret service crime prevention techniques were not confined to the combatting of counterfeiting and forgery. They were effectively applied in security work involving protection of the president, members of his family, and protection of numerous foreign dignitaries and other personages. Secret service agents protected President Roosevelt during his historic journeys to foreign countries and his wartime inspection tours in the United States. They were with President Truman at the United Nations conference in San Francisco, and the United Nations Charter was transported from San Francisco to Washington, D.C., in secret service custody. Careful preparations were made for Truman's conference at Potsdam with Stalin, Churchill and Attlee, and agents provided security for the president enroute and abroad at all times.

Among notables protected by the secret service, especially during World War II, were Crown Princess Martha of Norway and her family; Queen Wilhelmina and Princess Juliana of the Netherlands; Churchill; Attlee; Lord Beaverbrook; members of the British imperial staff; Sergio Osmeña, president of the Philippine commonwealth; Madame Chiang Kai-shek; the Earl of Athlone, governorgeneral of Canada; Mackenzie King, prime minister of Canada, and others.

One important security mission accomplished by the secret service shortly after war was declared was not revealed until after V-E day. On Dec. 26, 1941, secret service agents provided security during transportation of several priceless historic documents which were moved from the Library of Congress in Washington, D.C., to the government's gold depository at Fort Knox, Ky. The treasures included the originals of the Constitution of the United States, the Declaration of Independence, the Articles of Confederation, the Lincoln Cathedral copy of the Magna Carta, Abraham Lincoln's Gettysburg Address and Second Inaugural Address, and the Gutenberg Bible.

Despite the fact that more than 41% of secret service personnel joined the armed forces, its enforcement and crime prevention work progressed. Convictions of counterfeiters and forgers averaged more than 97% in cases which went to trial, the security work was performed efficiently and the crime prevention program rolled forward, thanks largely to the hearty co-operation of police departments, school authorities, banks and private business. Securities and Exchange Commission

At the beginning of the ten-year period 1937–46, the Securities and Exchange Commission (SEC), a quasi-judicial agency of the United States government, was administering three statutes designed for the protection of investors and enacted by the congress as a part of the early reform program of the New Deal. With these and four subsequent enactments a well-rounded pattern of securities regulation was established.

The SEC continued to be composed of five members, appointed by the president by and with the advice and consent of the senate. A bipartisan agency, not more than three of its members might be of the same political party. Its decisions were reviewable by the U.S. circuit courts of appeal at the instance of any person aggrieved by a decision of the commission affecting his rights and interests.

Administration of the 1933 Act.—The two basic objectives of the Securities Act of 1933 were: (1) to prevent fraud in the sale of securities, of whatever nature under penalty of fine or imprisonment, or both; and (2) to provide for disclosure to public investors of the facts they needed to know in order to determine whether to purchase securities offered for public distribution.

Disclosure of the facts was obtained through a requirement that registration statements be filed with the commission. The statements so filed were made publicly available for anyone's inspection. Specified items of information had to be reported, describing the terms and provisions of the security being registered as well as pertinent information concerning the issuer. A prospectus or selling circular was required to be made available to investors and to contain an accurate summarization of the facts thus disclosed. The commission did not guarantee accuracy of the representations, but persons responsible for the filing of false information subjected themselves to the risk of fine or imprisonment, or both; and investors had a right of recovery against the company, the underwriters and others for losses suffered in reliance upon false information.

The act of 1933 did not give the commission any power to disapprove the issuance of securities for lack of investment merit. However, the commission could deny or suspend the effectiveness of the registration statement if after hearing it found that the factual disclosures were materially inaccurate or inadequate. Such "stop orders" operated to prohibit the sale of the securities until the statement was amended to correct the deficiencies. If such corrections were made, the stop order had to be lifted. Thus, registration served only to make information available for investors. In no sense was registration to be considered by investors as a guarantee or assurance against investment risk in the purchase of registered securities. The investors themselves had to appraise the securities in light of the facts thus disclosed; otherwise the benefits of registration and disclosure were dissipated.

Securities in the aggregate amount of \$28,649,609,000 became effectively registered for sale to the public during the ten-year period, 1937–46, bringing the total of securities so registered under the act to \$35,643,000,000. Securities registered during the year ended June 30, 1946, aggregated \$7,073,280,000, the highest annual volume of registrations to that date.

On that date, effective registration statements numbered 5,511.

As of the same date, 6,572 registration statements had been filed with the commission, proposing security offer-

ings aggregating \$39,754,000,000. Of these, 913 were withdrawn, some because of changes in financing plans and many others because of unwillingness to make the required disclosure of facts about the security or the issuer. A total of 326 stop orders were issued, based upon material misstatements and omissions in the registration statements. Of these, 144 were lifted when the statements were corrected.

The registration requirements of the act did not apply to nonpublic offerings and intrastate distributions of securities, if properly circumscribed. Another provision exempted relatively small security offerings, the amount thereof having been increased from \$100,000 to \$300,000 under a May 1945 amendment to the act. In respect of such latter offerings, a simple letter of notification had to be filed with the commission, together with copies of the selling circulars.

Regulation of Trading Practices.—The beginning of the decade 1937–46 found the commission well advanced in its administration of the statute of 1934, designed by congress to regulate securities trading practices on exchanges and in the over-the-counter market. Passage of this legislation to eliminate abuses from interstate traffic in securities traded upon the nation's securities markets was a necessary adjunct to the 1933 law providing protection to investors in connection with new offerings or secondary distributions of securities.

Administration of the Securities Exchange act had contributed much to the advancement of the interests of investors and the public. Under the act, annual and other corporate reports of companies with securities listed upon exchanges were accumulated. These reports contained detailed information concerning such securities and the issuing companies. Filed, subject to legal penalties for misstatements, this information served as a valuable guide to the proper market appraisal of the investment merit of the securities. The importance of such disclosure requirements of the act and the extent of the public interest involved was emphasized by the annual dollar volume of securities traded on exchanges, which in 1945 approximated \$18,000,000,000.

The misuse by management officials of "inside" information was curbed through operation of provisions of this act (1) requiring such officials to report monthly to the commission their holdings and transactions in their companies' listed equity securities; and (2) making their short-term trading profits in such securities recoverable by the company.

Management officials also were forbidden to engage in short sales.

So, too, did the operation of the act during the decade 1937–46 result in greater participation by investors in the determination of the affairs of their companies than ever before. The exercise by investors of their important voting rights was greatly facilitated by commission rules governing the solicitation of proxies from holders of listed securities. These rules required disclosure of all facts pertinent to the particular matter upon which the votes of security holders were being solicited. Also, stockholder proposals might be included in management solicitations and thus submitted to a vote of the entire body of security holders.

Approximately 1,700 proxy solicitations were reviewed annually by the commission for compliance with the disclosure requirements of its rules.

It is important to observe, however, that the foregoing discussion of the protective provisions of this act applied only to securities listed upon exchanges. Only 3.585 secur-

ity issues of 2,188 issuing companies were listed in 1946. However, there were several thousand other securities traded exclusively in the over-the-counter market; and with respect to all of these (except securities of companies subject to the Public Utility Holding Company and Investment Company acts) there were no comparable provisions requiring disclosure of information, curbing misuse of "inside" information, or regulating proxy solicitations. Recognizing the added benefits to investors which would flow from a more universal application of these protective provisions of the law, the commission, in June 1946, presented a report to congress recommending their extension to securities of the larger U.S. corporations not then listed.

Securities trading practices, both on exchanges and in the over-the-counter market as well as among brokers and dealers generally, were the subject of other provisions of the act designed for the protection of investors and the public. These provisions divided themselves into: (1) outright prohibitions against misstatements, deceit, market manipulation, and other fraudulent acts and practices; and (2) provisions for the regulation of trading practices upon exchanges and in the over-the-counter market and of the activities of brokers and dealers, to eliminate malpractices and establish new and improved standards of business conduct and fair dealing. Regulation by the board of governors of the federal reserve system of the extension of credit or "margin" on transactions in listed securities contributed a stabilizing influence over exchange trading.

The first step in the process of improving the standards of conduct in the financial community involved registration with the commission of the nation's securities exchanges. As a prerequisite to such registration, a showing was required that the exchanges' constitutions, bylaws, rules and procedures were such as to meet the prescribed standards of the act. Among these were fair trade practice rules applicable to the membership; powers of discipline over members for conduct inconsistent with just and equitable principles of trade; and undertakings to comply with the act and regulations thereunder, and to enforce compliance by exchange members. Nineteen exchanges maintained registrations with the commission as meeting these standards; and during the course of the intervening years, numerous revisions of the rules of the exchanges were made to meet new and changed situations (many being recommended by the commission to afford additional protection to investors and the public). Foremost among these was a basic reorganization of the administrative machinery of the New York Stock exchange in 1938, providing among other things for direct representation of the public on its board of governors. The commission was empowered to modify exchange rules whenever necessary for the protection of investors.

Similar regulatory provisions applied to the over-the-counter market. Brokers and dealers were required to register with the commission and to conform their business practices with standards prescribed in the act and in commission regulations as necessary for the protection of investors. On June 30, 1946, 4,132 brokers and dealers were registered with the commission. Pursuant to the Maloney act amendment passed by congress in 1938, a national organization of over-the-counter brokers and dealers was organized, under the name of National Association of Securities Dealers, incorporated (N.A.S.D.). Its membership approximated 2,500 in 1946. This association prescribed fair trade practice rules governing its

12 m

membership, and had powers of discipline for rule violations; its rules and disciplinary actions were subject to review by the commission.

Both the exchange and the over-the-counter markets were under constant surveillance by the commission in the interest of curbing misrepresentation, market manipulations, and other fraudulent acts and practices. The penalty for such offenses might be suspension or expulsion from exchange membership, the commission having invoked such remedies in a number of cases; or the commission might deny or revoke the registrations of brokers or dealers, or suspend or expel them from membership in the N.A.S.D. Registrations denied or revoked numbered 290 as of June 30, 1946, the number of suspensions and expulsions from the N.A.S.D. being 28. Other sanctions included civil actions to enjoin continued violations, and criminal prosecutions.

In many of its "disciplinary" actions, the commission found that unscrupulous dealers had defrauded investors by selling securities to them or buying securities from them at prices far above or below the current market, while misrepresenting or withholding facts which the investor was entitled to know concerning the market—the dealer exacting exorbitant profits in the process. As an aid to the elimination of this abuse, the N.A.S.D. set up a procedure under which sales or purchases at more or less (respectively) than 5% above or below the current market would set in motion an inquiry as to whether, under all the circumstances, fair treatment had been accorded the customer; if not, disciplinary action was taken.

Another significant development involved the public offering of securities registered under the Securities act. An SEC study showed that in a number of cases the securities sold substantially above the specified public offering price almost immediately after the commencement of the offering. It further appeared that one of the primary causes was the withholding by underwriters and distributors of substantial blocks of the securities with the result of artificially restricting the available supply of stock; this created a correspondingly excessive demand for the available stock, carrying the price to higher levels and permitting the later sale of the withheld stock at a higher margin of profit to the underwriters and distributors. Arising during a period of heavy demands for new stock offerings, this abuse was a good illustration of the new and varying problems with which the commission had to cope in its efforts to protect investors.

Administration of the Public Utility Holding Company Act.—Enacted as a result of public investigations into the evils and abuses which marked the growth of huge utility empires during the 1920s, the Public Utility Holding Company act of 1935 directed the commission to regulate the financial and related practices of holding company systems of electric and gas companies in the interest of curbing such practices. It further directed the commission to take such action as might be necessary to delimit the systems, so that their operations would be confined to economically integrated units and related businesses, and to simplify the corporate and capital structures of system companies and provide an equitable redistribution of voting power among security holders.

Opposition to such regulation precipitated a bitter congressional battle; and this opposition was carried over into the courts following enactment of the measure. Accordingly, when the major holding companies refused to register upon passage of the law (because of alleged un-

constitutionality), the commission prosecuted a test case (against Electric Bond and Share company) which resulted in a U.S. supreme court ruling in March 1938, upholding the constitutionality of the act's registration requirements.

Thus, the industry was subjected to regulation in the interest of protecting investors, consumers and the public against corporate practices which previously had resulted in huge losses to U.S. investors and the bankruptcy of many holding and operating companies. Vast concentrations of control over far-flung and unrelated properties had been accomplished by methods which led to the creation of unsound and top-heavy financial structures, many of which could not weather slight declines in earnings. This control was to be broken up, permitting the return of local control and management and of effective state regulation and limiting system operations to integrated, economic units.

Administration of these requirements for readjustment, characterized by the commission as the "key provisions of the act" and the real target of the opposition before congress, occupied a considerable portion of the commission's time and efforts. Much progress was made in the integration of the physical properties of the nation's utility systems and in the simplification and rehabilitation of their corporate structures, these accomplishments being attributable both to voluntary action by holding companies and to action ordered by the commission to effectuate its objectives. Despite the protests of the opposition that the legislation would lead to the destruction of security values, actual experience demonstrated that the reverse was true. In no instance was there a dumping of securities upon a market unable to pay a fair price for them; on the contrary, there were numerous instances of sharp increases in the market prices of securities attributable in substantial part to steps taken to comply with the act. Many holding company stocks had more than doubled in price upon announcement of company plans for integration or simplification.

Other beneficial effects of compliance with the act's objectives included the substitution of sound structures providing fair voting rights in place of top-heavy structures under which public security holders, who had supplied almost all the capital, were disfranchised; the release of operating utility companies from absentee control, permitting local management and regulation; the distribution of underlying portfolio securities to the stockholders of holding companies who were far removed from the ultimate source of earnings and dividends; and the simplification of capital structures, often permitting the resumption of dividends after years of default.

While, as indicated, much of this progress resulted from voluntary company action, there were several court contests of commission orders directing compliance. Among these were SEC orders (1) directing two major holding companies to divest themselves of scattered properties found not to be retainable with their respective principal, integrated systems; and (2) directing the liquidation of two large subholding companies in one major system because they served no useful or economic function and constituted undue and unnecessary complexities in the system. By mid-1946, only one of these cases had been decided by the supreme court, to which they ultimately were appealed; and in that case the court upheld the constitutionality of the integration clause of the act (that being the only issue which the case posed for court determination). In the other undecided integration case, questions of administrative interpretation were involved; and both the constitutionality of the corporate simplification clause and questions of administrative interpretation were involved in the two liquidation cases remaining undecided. In these and related cases appealed to and decided by the courts, the commission's rulings in all cases had been sustained, except for a reversal on a minor issue in one case. In all other cases involving court review of commission decisions under this act, only one important but incidental ruling failed of court affirmation.

One measure of the progress toward accomplishment of these objectives of the act was reflected in the \$6,100,000 000 001 utility and nonutility properties whose proscribed control by particular holding companies had been eliminated as of June 30, 1946. An additional \$3,250,000,000 of properties were then under orders requiring similar divestment. Plans numbering 68 for corporate simplification and redistribution of voting power among security holders had been approved by the commission; and numerous other cases had been carried to advanced stages. In all such cases, the commission had to find that fair and equitable treatment was accorded each class of security holders affected and that the objectives of the act otherwise were effectuated.

As of June 30, 1946, the issuance and sale of securities of holding and operating companies in the aggregate amount of \$9,700,000,000 had been passed upon by the commission as meeting applicable standards of the act. Conformance to these standards brought about more conservative accounting, depreciation, dividend and financing policies by companies affected, thus strengthening their financial condition and sateguarding the interests of investors and consumers. Maintenance of competition for the underwriting of securities was required. Other protective provisions of the law applied to the purchase and sale of securities and other assets; mergers and consolidations; solicitations of proxies and other authorizations; dividend and accounting policies; servicing contracts and other similar arrangements; and other related matters. The law also forbade political contributions.

Trust Indenture Act of 1939.—This act required that indentures under which the larger public offerings of bonds, debentures, notes and similar debt securities were to be made, should contain specified provisions designed to safeguard the interests of the purchaser. Provisions relating to the indenture trustee, as representative of the security holders, included a requirement for a corporate trustee with minimum combined capital and surplus, prohibited certain conflicts of interest, imposed high standards of conduct and responsibility, precluded the preferential collection of certain claims owing to the trustee and provided for reports and notices by the trustee to the investor. Other provisions related to the maintenance of bondholders' lists and the supplying of evidence to the trustee of compliance with indenture provisions. As of June 30, 1946, trust indentures qualified as meeting the applicable standards of the act covered an aggregate of \$9,085,000,000 securities proposed for public sale.

Investment Company Act of 1940.—While the sale of investment company securities was subject to the registration provisions and fraud prohibitions of the Securities act, special legislation was found necessary to curb abuses prevalent in the conduct of investment company affairs. Accordingly, such companies were subject to regulation under the act and were required to conform their business practices to various standards prescribed therein in the interest of protecting investors. Among these were special prohibitions against transactions between companies and affiliated persons unless found by the com-

mission to be fair and to involve no overreaching. Management abuse of trust obligations to security holders became a statutory ground for their removal by courts upon application of the commission. Mergers and consolidations were subjected to special SEC scrutiny.

Investment companies numbering 361 and having aggregate assets perhaps exceeding \$3,500,000,000 were registered with the commission at the close of the period.

Investment Advisers Act of 1940.—There were registered with the commission on June 30, 1946, 853 individuals and firms engaged in the business of advising others with respect to their securities investments. Under the act, they were required to conform their activities to the prescribed standards, including disclosure of any adverse interest they might have in transactions for their clients. Acts or practices constituting fraud were prohibited.

Bankruptcy Act.—In reorganization proceedings for debtor corporations in which there was a substantial public interest, the commission, pursuant to the provisions of chapter X of the Bankruptcy act, was to participate as an independent, expert adviser to the courts. The commission's special concern in these proceedings was the fairness of the terms of reorganization plans as they applied to the several classes of security holders whose interests were at stake, and the feasibility of the plans, particularly in terms of the ability of the reorganized company to continue as a going concern. The commission's views on these and related problems normally were presented orally or by memorandum to the courts; in the larger and more complicated cases, however, the commission prepared advisory reports for the information of the courts and interested security holders.

Enforcement Activities.—In addition to the commission's administrative powers previously discussed, the commission had the duty of investigating complaints and other indications of securities violations. Where evidence developed of a violation of law, the commission might seek a court order enjoining the acts and practices complained of; or, if fraudulent misconduct was apparent, it might refer the facts to the department of justice for prosecution.

By 1946 the commission had obtained court orders enjoining 1,054 companies, firms and individuals from continuing acts or practices alleged to violate the securities laws. Persons convicted of fraudulent securities transactions numbered more than 1,200. (See also Law; Stocks AND BONDS.)

Seismology

Turkey suffered more than any other country in earthquake casualties during the decade 1937-46. The Erzingan

earthquake of Dec. 27, 1939, killed 23,000 persons. Twenty-seven hundred were killed in the Samsun area on Nov. 26, 1943, more than 1,300 in Anatolia on May 31, 1946, and nearly 1,000 in the Gerede area on Feb. 1, 1944. Several hundred were lost in each of six other shocks. Casualties were caused largely by the tendency of native mudwall and tile-roof structures to collapse under relatively moderate earthquake forces.

In South America casualties ran high in five earthquakes. Ten thousand were killed in the destruction of Chillan, Chile, on Jan. 24, 1939. At San Juan, Argentina, on Jan. 15, 1944, 3,500 were killed and damage was estimated at \$100,000,000. On May 24, 1940, 249 were killed at Callao, Peru, and there was great damage. Guayaquil, Ecuador, on May 13, 1942, suffered \$2,500,000 damage and the loss of 200 lives. Two hundred were killed in Cuzco province, Peru, on Jan. 30, 1943.

Japan remained relatively quiescent. The most notable shock occurred on May 1, 1939, when hundreds were lost as the village of Aikawa was destroyed. A seaquake greater than the Tokyo earthquake of 1923 centred 100 mi. off Honshu Island on Dec. 7, 1944, but only slight damage occurred along the coast.

A strong shock killed 17 at Accra, Gold Coast, Africa on June 22, 1939; 276 were reported killed at Constantine, Algeria, on Feb. 14, 1946. On Nov. 10, 1940, 400 were killed, great damage done and oil fires started at Focsani, Rumania. A shock near Colima, Mexico, on April 15, 1941, killed 90 and caused \$1,000,000 damage in Mexico City.

In the U.S., the Imperial valley earthquake of May 18, 1940 killed 9 persons and caused \$6,000,000 damage. In the Torrance-Gardena area of Los Angeles an earthquake on Nov. 14, 1941, caused \$1,000,000 damage. On Sept. 5,

Seismographers at the Fordham university seismic station in New York city, source of most public information in the U.S. concerning earthquakes and tremors

1944, earthquake damage at Cornwall, Canada, and Massena, New York, reached \$2,000,000. Strong shocks also occurred in Ohio, New Hampshire, Washington and California.

On Nov. 27, 1945, a violent seaquake in the Arabian sea generated a sea wave which was reported to have killed 4,000 on the coast near Karachi, India. On April 1, 1946, the greatest seismic sea wave in the Pacific in many years swept down from the Aleutian Islands, killing nearly 200 at Hilo, Hawaii, and causing \$10,000,000 damage. The wave there was 20 ft. high. It spread out over the entire Pacific basin.

Paricutin volcano in Mexico, breaking through a cultivated field on the afternoon of Feb. 20, 1943, caused prolonged but localized seismic activity. The atom bomb test explosion in New Mexico on July 16, 1945, was recorded as a light earthquake on seismographs in the U.S.

In California, plans were made by public officials and public utilities groups for joint action in case of disastrous earthquakes. A new building code covering earthquake forces was published in the U.S. under federal auspices, and similar codes were under consideration in many other countries, especially South and Central America. Earthquake insurance was discussed in papers by A. C. Chick (U.S.) and O. Seiler (Switzerland).

Engineering-Seismological Research.—Basic instrumental data on destructive ground motions, obtained by the U.S. coast and geodetic survey, were used in research on the design of earthquake-resistant structures. Strong-motion seismographs were installed in several South and Central American countries. The mathematically laborious problem of computing earthquake stresses in structures was solved by a torsion pendulum device. Results obtained with it emphasized the important influence of foundation conditions on earthquake damage.

At Boulder dam sensitive seismographs were successfully used to investigate local shocks caused by changing water loads. The shocks were generally associated with local fault patterns.

Data Used to Detect and Track Hurricanes.—Minute ground waves called microseisms are continually recorded on seismographs all over the world and are known to be of meteorological origin. By utilizing a newly discovered method of measuring the direction of propagation of these complex waves at an observing station, the U.S. navy was successful in detecting and tracking hurricanes in the West Indies and adjacent areas. The method was originally demonstrated at St. Louis university, Missouri, by Rev. J. Emilio Ramirez and Rev. James B. Macelwane. In some cases low pressure areas were detected thousands of miles away. Important microseismic investigations based primarily on amplitude fluctuations were made in India, China, England, the U.S. and some other countries in attempts to learn more of the mechanics of their origin.

Earthquake Investigations.—Publication of epicentres of the earthquakes of the world, based on instrumental data, continued at Oxford university, England, under the auspices of the International Seismological association. Work on descriptive catalogues was advanced in Spain, Switzerland, Jamaica, Germany, New Zealand and especially in South and Central American countries. A comprehensive study of the seismicity of the earth was made by Beno Gutenberg and Charles F. Richter (Pasadena), and periodicity studies based on 131 catalogues were published by Charles Davison (Cambridge).

Use of the Pasadena earthquake magnitude scale, utilizing instrumental data, greatly advanced knowledge of the frequency and energy distribution of earthquakes. It re-

vealed that about 80% of the total earthquake energy released in one year (by possibly 100,000 shocks) may be expended in one great earthquake. A definite relation was developed between the instrumental magnitude scale and an intensity scale based on observed surface effects. Deep focus earthquakes which occasionally originate as much as 500 mi. below the surface were given further study especially by U.S. and British seismologists, and there was wide discussion on their geological implication.

Instrumental Investigations.-Harry O. Wood (Pasadena) published a new list of the seismographic stations of the world as they existed at the start of World War II. The war caused many disruptions. New stations were established in the Americas, Africa and on islands of the Pacific. Perry Byerly (Berkeley) used seismographic data to verify the existence of mountain "roots." Maurice Ewing (Woods Hole Oceanographic institute) determined the structure of a section of the continental shelf on the east coast of the U.S. Seismographic data were also used to investigate the structure of the continents, the extent of continental layering in the oceanic basins, density variations in the earth's interior, the mechanism of faulting, changes in the physical state of the earth's interior with depth and kindred subjects. Studies of seismic wave propagation and earth structure were supplemented in other fields by high pressure laboratory experiments on rocks. Further investigation of regional variations in the speeds of seismic waves and the development of seismological tables for deep focus earthquakes materially improved the accuracy obtained in locating earthquakes. A comprehensive work on seismic wave analysis was published in Finland. During the war seismographs were used to locate earthquakes in axis occupied territory. (See also DISASTERS; GEOL-

Selective Service, U. S.

Selective Service in the U.S. during World War II was predicated upon at least one proposition as old as society itself, that every citizen is under obligation to join in the common defense of his country, his community, his hearthstone. Another proposition was that in a national emergency, the national government has absolute authority over its armed forces. And the all important proposition that local self-government is the fundamental basis of U.S. democracy was often called the heart and soul of Selective Service.

The Selective Training and Service act of 1940 embraced these propositions closely. Liability for military service was placed equally upon all male persons between the specified ages of 21 and 36. There were very few exceptions. Men were to serve in the national forces instead of in state or local militia, as they served during the early days of the country. And selection was to be made by neighbours and fellow civilians under a system of supervised decentralization. In principle, though with many modifications, 1917 Selective Service legislation was used as a "lesson book."

The 1940 act was the first peacetime military training law in the nation's history, and there were several limitations in the original legislation which took into account the peacetime situation. Not more than 900,000 men were

to be in training at one time; the inducted men were to serve and be trained for a period of 12 months or less, unless sooner relieved, or unless congress declared the national interest imperilled, and they were not to be employed beyond the limits of the western hemisphere, except in U.S. territories and possessions. These limitations were removed by congress a few days after the Japanese struck the U.S. at Pearl Harbor in Dec. 1941.

The president was authorized to defer men from training and service by reason of age, occupation or dependency, but deferments were to be made on the status of the individual, and no deferments could be made by occupational groups or by groups of individuals in any plant or institution. Bounties and the hiring of substitutes were prohibited. The statute exempted ministers of religion and certain high public officials from the liability for training and service during the time they held office, and permitted men opposed to participation in war by reason of "religious training and belief" to undergo either noncombatant or nonmilitary service, depending on the degree of their objection. A significant new feature was the re-employment provision, which sought to guarantee the citizen-soldier reinstatement in the position he left to enter service, upon the completion of that service. This provision, as well as the other main provisions of the act, will be discussed in detail under appropriate sections following.

Termination date of the act was May 15, 1945, except for the provisions relating to reserves, re-employment and pay of enlisted men. The termination date later was changed successively by congressional action to May 15, 1946; June 30, 1946; and finally March 31, 1947.

Actual planning for the mobilization of U.S. manpower in case of an emergency had begun in 1926, with the appointment of a Joint Army and Navy Selective Service committee, to carry out the will of congress expressed in the National Defense act of 1920, providing that it was to be the duty of the war department general staff "to prepare plans... in conjunction with the naval forces... for the mobilization of the manhood of the nation."

The first effort of this committee was to analyze and study the experience of Selective Service during World War I. The group was made up of four officers, one from the navy, one from the marine corps and two from the war department. They foresaw the need for more personnel to undertake a long-range program of study, research and planning, and as a result of their recommendations there was assigned to the committee an allotment of 95 civilian reserve officers, drawn from all parts of the U.S., representing a cross section of national life and varied civilian endeavours. These reserve officers met and conferred once a year, learning from officials who had been associated with Selective Service the principles and problems, and studying plans and regulations for the organization and operation of a nation-wide manpower procurement agency-in the event that it might be needed.

By 1935, complete details of the organization had been worked out on a national level, and the adjutant general of the national guard in each state had been asked to co-operate in the organization and administration of Selective Service within his state. Reserve officers, reinforced by national guard officers, assigned to the Joint Army and Navy Selective Service committee, were attending one of the 4 annual regional conferences of 14 days' duration. Nearly 7,000 extension course lessons were being completed every year by these officers.

In June 1940, after the flames of war abroad threatened to spread to the United States, the congress of the U.S. began to study plans for the training and service of men "to augment the armed forces." The Joint Army and Navy Selective Service committee was ready with results of its own studies and planning. The committee's allotment of 95 reserve officers was prepared to function as a national headquarters and as liaison officers with the various states. The adjutants general of the states were ready with their staffs to function as a state headquarters. Altogether there were about 350 officers of the army, navy and marine corps in reserves and in the national guard who were trained specialists in Selective Service.

Organization.-Before proceeding to a detailed discussion of the operations of Selective Service, it would be well to examine the organization which carried out these operations. Selective Service was administered by a civilian agency under the direction of the president. This agency, the Selective Service system, consisted basically of units known as local boards, a headquarters in each state and territory and a national headquarters in Washington, D.C., under a director of Selective Service. The 6,443 local boards, at least 1 in every county or similar area in the nation, were composed of 3 or more civilian members who were citizens of the U.S., residents of the area over which their board had jurisdiction and at least 35 years of age. They were appointed by the president upon recommendation of the governors of the states and served without compensation. Upon these local board members was placed the responsibility of selecting men for training and service. Though these men were unpaid, and usually had other full-time occupations, they met frequently to carry out the duties assigned them.

Also attached to each local board were one or more reemployment committeemen to advise and protect veterans in their rights to obtain their old jobs back as provided in the Selective Service act; medical and dental examiners to assist local boards in classifying registrants whose mental or physical conditions would disqualify them for military service; and a government appeal agent to carry appeals in behalf of the registrant or the government. There were also one or more boards of appeal for each state. Each of these Selective Service officials was uncompensated. At the peak of Selective Service operations, there were some 180,000 citizens contributing their services to the program.

The work of the local boards was directed and co-ordinated, within the states, by a state headquarters under a state director appointed by the president upon the recommendation of the governor, and the entire system was operated by the national director, appointed by the president and directly responsible to him. Dr. Clarence A. Dykstra, president of the University of Wisconsin, was the first national director, serving from Oct. 15, 1940, until his resignation March 21, 1941. He was succeeded by Maj. Gen. Lewis B. Hershey, then a brigadier general, a regular army officer and veteran of World War I, who had served as executive officer of the Joint Army and Navy Selective Service committee from 1936 until 1940, and then as deputy director under Dykstra.

The Job.—Selective Service consisted of three fundamental processes: registration, classification and delivery for induction. By registration was meant the listing by name of all men within prescribed age groups in order to obtain an inventory of manpower for military service. Classification was the determination of the relative availability for military service of the individuals registered, and

the selection of those most available. Delivery for induction was the final step, in which the men selected were sent to army and navy induction stations, where those acceptable to the armed services were inducted and became members of the land or naval forces. Although there were changes in details, each of these functions remained substantially the same after Selective Service was put into operation in 1940.

Added to these basic tasks, Selective Service was charged, under the act of 1940, with administering re-employment provisions of the Selective Service act, guaranteeing the citizen-soldier restoration to the position he left to enter service; and, further, with the management of a program of "work of national importance" for men whose religious training and belief forbade their participation in any form of war.

Some idea of the magnitude of the Selective Service task can be obtained when it is considered that between the years 1940 and 1946, more than 45,000,000 men were registered; some 32,000,000 were classified, many of these more than once; and 11,000,000 men were forwarded and accepted for induction by the armed forces. Each of these millions of men was treated as an individual case. Every man had a record to be made and kept. Changing circumstances—the status of the individual, the needs of the armed forces and the requirements of industry—demanded constant scrutiny of each classification and necessitated changing many classifications many times, as indicated by the fact that although 32,000,000 men were classified, classification actions totalled more than 250,000,000.

After passage of the act, and while the organization in the state and local communities was still being perfected, the task of registration was accomplished. The legislation prescribed that, with certain exceptions, every male citizen and alien between the ages of 21 and 36 residing in the U.S. on the registration day would be required to register. The act provided that the president should proclaim when, where and how the registration would be held. Excepted from liability for registration were those already in the military or public health service, and certain aliens of recognized status.

On the same day as passage of the act, the president issued a proclamation calling for the first national registration to be held Oct. 16, 1940. Seven days later regulations were published, outlining the manner in which the registration was to be carried out. The president called upon governors of the states and all public officials to cooperate. Local election machinery formed the basis for the registration system, but this was augmented by many volunteer workers. It was estimated that 1,000,000 persons conducted the registration throughout the nation, in school houses, polling places and other centres. The final total of the first registration was 16,565,037.

During Oct. and Nov. 1940 separate registrations were held, by special proclamation, for the territories of Alaska, Hawaii and Puerto Rico.

The second national registration, for those men who had become 21 years of age after Oct. 16, 1940, was set by presidential proclamation for July 1, 1941. The statutory basis of this registration was the provision of the original act which made male persons between the ages of 21 and 36 liable for registration. In view of the fact that fewer than 1,000,000 men were involved, the registration was carried on through the local boards. The second registration likewise proceeded smoothly and without untoward incident. A total of 850,451 men was enrolled in the U.S. and its territories.

The third registration was held a year and a half later,

on Fcb. 16, 1942, and was an immediate aftermath of the declaration of war by the U.S. The congress passed public law 360 on Dec. 20, 1941, extending the liability for registration and military service to men between the ages of 20 and 45. Under the first and second registrations men aged 21 to 36 had already been enrolled, so the third registration included those aged 20, those who had become 21 after the second registration and men between the ages of 38 and 45. In the three registrations, more than 26,000,000 men had been registered, all of them liable for military service. The third registration totalled 8,635,236 in the U.S. and its territories.

Three months later, on April 27, 1942, a fourth registration was held, to include men between the ages of 45 and 65 years. These men were not liable under the existing legislation for military service, but their registration was provided for under public law 360, passed Dec. 20, 1941. Again, as in the first registration, there was comprehensive use of the election machinery in carrying out this registration, because of the great numbers involved; 14,369,325 men were registered in the U.S. and territories. No order numbers were assigned these men, and they were never considered for classification, but they were required to fill out and return a special occupational questionnaire, inquiring into their industrial, agricultural and professional skills. A copy of this form was given to the U.S. employment service.

Although men aged 18 and 19 years were not made liable for military service until near the end of 1942 their liability for registration had been established in the Dec. 1941 legislation, dependent upon presidential proclamation setting a time and a place. Registration date for these men was June 30, 1942, and at that time 2,871,121 men were registered in the U.S. and territories.

Thus, 5 registrations were held during the period Oct. 1940 to June 1942, including a total of approximately 42,000,000 men between the ages of 18 and 65 years, of whom approximately 26,000,000 were at that time liable for military service. Five months later, with the passage of public law 772, men aged 18 and 19 were made liable for military service, increasing the militarily liable manpower pool to approximately 28,700,000.

The sixth registration was, in fact, two registrations. The first part of it included those men who had become 18 years of age after June 30, 1942, and was held between Dec. 11 and 31, 1942. A total of 521,738 was registered in the U.S. and territories.

The second part of the sixth registration was a continuing process which began Jan. 1, 1943, the next day after the close of the first part of the registration. In it every man was required to register as he became 18 years of age, excepting those already in the services by that time. In addition, men who were in the service at the time that men of their age group were required to register, were expected to perform that duty within ten days after their discharge from service. Hence, the sixth registration was a cumulative but only partial inventory of men who became 18 years old each month, since there were excluded those who enlisted in the army or navy before reaching 18. In addition to the 18-year-olds, then, were those from other age groups who had not previously registered, including men discharged from the land or naval forces, and men returning from foreign countries or leaving institutions of various kinds.

A seventh registration, for U.S. citizens abroad, was called for in a presidential proclamation of Oct. 26, 1943, to be held between the dates of Nov. 16 and Dec. 31, 1943. In a sense, this was not a distinct registration from those

previously held, but a new opportunity for U.S. citizens residing abroad who were required to register under the six previous proclamations. These persons did not have to register while they remained abroad, but were required to do so the first time they entered the continental limits of the U.S., or Alaska, Hawaii or Puerto Rico. The Oct. 1943 proclamation, however, extended the liability to register to these men wherever they might be. The registration was made before any diplomatic or consular officer of the U.S., who was a U.S. citizen, or before any duly appointed registration official, or any member or clerical assistant of a Selective Service local board. The age limits were placed at 18 through 44, thus excluding those men more than 45, though men 45 to 65 years of age had been required to register in the U.S., but for occupational reasons only. As of Oct. 1, 1945, there had been registered 31,944 men under the seventh registration.

Classification.—As used in Selective Service, classification referred to the determination of the relative availability for military service of the men who had registered. Their selection for service obviously followed when they were needed. Registrants were classified by the local boards, under provisions of the Selective Training and Service act of 1940, as amended, and under regulations prescribed by the president.

The act provided (section 4a) that "the selection of men

Table I.—Total Registrants, Excluding Fourth Registration, by State of Registration Oct. 1, 1946

for training and service...shall be made in an impartial manner... from the men who are registered and classified but not deferred or exempted, provided... that there shall be no discrimination against any person on account of race or color." The local boards, the act stated, "shall have power within their respective jurisdictions to hear and determine, subject to the right of appeal...all questions and claims with respect to inclusion for, or exemption or deferment from, training and service under this Act of all individuals within the jurisdiction of such local boards." (Section 10a[2].)

The regulations pointed out that classification was "the key to selection, and it must be accomplished in the spirit of the Selective Training and Service Act, in the preamble of which Congress has declared 'That in a free society the obligations and privileges of military training and service should be shared generally in accordance with a fair and just system.'"

Four main classes were established, generally defined as follows: class I, men available for military service; class II, men necessary in their civilian capacity (deferred because of occupational status); class III, men with dependents (deferred because of dependents); class IV, men deferred specifically by law; those unfit for military service; and conscientious objectors available for civilian work of national importance.

Each of these main classes was subdivided. The subdivisions were changed somewhat during the course of Selective Service operations to meet changing conditions, but the nature of the four main classes remained unchanged. These subdivisions will be discussed later in more detail.

The task of Selective Service was to provide manpower for the land and naval forces of the U.S., but, as the regulations pointed out, "with the least possible disruption of the social and economic life of the Nation." The task was relatively simple during the period from Oct. 1940 to Dec. 1941 because there were 17,000,000 registrants to select from, and the act provided that not more than 900,000 men could be in training at any one time. In one sense,

Secretary of War Stimson being blindfolded before selecting the first capsule in the U.S. draft lottery Oct. 29, 1940, at Washington, D.C. President Roosevelt (left) watched the drawing made from the same "goldfish bowl" used in the 1917 draft. The first number drawn was 158

however, it was more difficult to induct a man in peacetime than during wartime. For there are no drums beating in peacetime, no flags waving for the "hero going forth to do or die for his country." Induction during peacetime is apt to be a mundane affair in the eyes of the inductee and his friends, even though peacetime service is as honourable and patriotic as wartime service. At any rate, when war came to the U.S., the needs of the armed forces grew at the same time that the need for more men for war production increased. And the decision had to be made individually, in every case, as to where a man would be most useful to the national interest in a uniform or at the civilian job he was doing. Classification, in short, was not a mechanical process by which the local board merely took men as their order numbers came in sequence and forwarded them for induction. The case of each man had to be considered as to his rights under the law and the regulations; if he had dependents, the hardship which might be suffered because of his induction had to be determined. Finally, consideration was given as to whether he would serve the national interest better in the armed forces or as a civilian.

One of the major problems in connection with Selective Service was that of determining which of several hundred or thousand registrants a local board should consider for military service first. It was patently unfair to go through the list alphabetically, or in the order in which they happened to register, or in any other manner subject to individual variations among local boards. The order in which registrants were considered meant a considerable difference in the time at which an individual registrant might be called up for military service. The problem was solved in 1940, as it had been in 1917, by means of a national lottery.

First, the individual registration cards in each local

board were shuffled indiscriminately. Then each was assigned a number, which became known as the serial number, but which at this point had no particular significance. Then at Washington, D.C., there was held a national lottery, in which numbers 1 to 9,000 were drawn-numbers which corresponded to the highest number of serial numbers which had been assigned by any local board. The order in which these numbers were drawn was officially and carefully recorded on what was known as the national master list, and this list became the basis on which local boards considered registrants. Thus, serial number 158 was the first number drawn in the first lottery, which meant that every registrant who had been assigned serial number 158 was placed in the position of order Number 1, or the first man to be considered by his local board for military service. The order number was again used by the local board in calling up men for military service after they had been classified.

This method was used in the first, second and third registrations. Separate national lotteries were held for each registration. In the fifth and sixth registrations no lotteries were held, but the order numbers were determined by the date of birth of each registrant, and men born on the same day were assigned numbers alphabetically by name. For the fourth registration serial numbers were assigned, but no order numbers, because the men included in this registration were not liable for military service.

As soon as registration cards had been assigned order numbers, the local board was ready to commence classifying the registrants, in the sequence of the order numbers. In order to facilitate the classification process there was needed more detailed information than that contained on the registration card, which merely told the man's name, address, age, place of employment and similar details. Consequently, registrants were required to fill out comprehensive questionnaire forms, on which they listed information concerning their physical condition, education, occupation, family status, citizenship, military service and any other factors which they desired to have considered by the local board in determining the classification. Registrants who by religious training and belief were conscientiously opposed to war in any form, were given an opportunity of stating their case in this questionnaire. Local boards were empowered to summon any person to appear and testify under oath as a witness, in order to obtain additional information concerning a registrant.

Selective Service headquarters in New York city as workers checked names and numbers during the lottery of March 17, 1942

To assist the registrants in filling out questionnaires, registrants' advisory boards consisting officially of three attorneys, with associate members in many instances, were established.

After receiving the registrant's questionnaire, the local board proceeded to determine in which class the registrant should be placed. The classification was made on the basis of the questionnaire and all other information in the registrant's file, and was made in accordance with an established sequence by placing the registrant in the first class for which grounds had been established. This sequence varied from time to time, but fundamentally the board considered first whether the registrant might be deferred by reason of having been honourably separated from the land or naval forces of the U.S. or of cobelligerent nations. If this classification did not apply, the board then decided whether he might be deferred or exempted by specific provision of the act, as a minister or public official, or by reason of age, as a registrant over or under the age groups currently liable for military service. If the registrant did not fall into any of these categories, it was then determined whether he should be deferred by reason of dependency or hardship, on occupational grounds or moral unfitness.

If no grounds were established for placing the registrant in any of the deferred or exempted classes, he was then classified "I-A," available for military service, provided that if he claimed to be a conscientious objector, the claim should be determined. If the board found that he was conscientiously opposed to combatant service only, he was classified "I-A-O," and if he was found to be a conscientious objector to both combatant and noncombatant military service, he was classified "IV-E."

Registrants classified in these three groups were, after Feb. 1, 1942, physically examined by medical representatives of the land or naval forces before they were ordered to report for induction. This step was known as the "preinduction physical examination." Men were selected for this examination by sending first volunteers for induction in the sequence in which they had volunteered, followed by other registrants in the sequence of their order numbers. When the local board was of the opinion that a registrant had a manifestly disqualifying defect, the local board examining physician might conduct the examination, and the local board might classify the registrant accordingly.

After the registrant had been given the preinduction physical examination, if he had been found acceptable for service, his classification remained as it was "I-A, available for service." If for any reason he had been found disqualified for military service, the registrant was reclassified "IV-F."

It should be pointed out that whenever any registrant was found to be physically or mentally unfit for any military service, he was classified in the first one in sequence of the deferred or exempted classifications for which grounds had been established.

The preceding paragraphs present a bare outline of the classification procedure, to which some of the more important ramifications and problems, including occupational deferments, dependency deferments, physical examination procedures and others will be discussed later. At this point there should be discussed the right of appeal from the local board classification, which was provided in the basic legislation, and which also provided that the president should establish such appeal boards and agencies of appeal as might be necessary to carry out the provisions of the act,

and that these boards and agencies should be composed of civilians, citizens of the U.S. Regulations outlining the method of appeal stated that the registrant, any of his dependents, his employer, the government appeal agent or the state director or national director of Selective Service might appeal a local board classification.

The appeal procedure did not follow the pattern of judicial review. Liberal provision was made for the registrant to be heard. He could appeal by making a written request, for which no particular form was prescribed. He could be accompanied by an interpreter, but not by an attorney. He had ten days after the notice of his classification was mailed by the local board to appeal to the appeal board.

The governor of each state divided the state into appeal board areas, each containing about 70,000 registrants of the first registration, or about 300,000 population. Throughout the Selective Service system there were 332 boards of appeal. Members, normally five in number, were appointed by the president—male citizens of the United States, residents of the area over which their board had jurisdiction, and not members of the land and naval forces. Usually the membership was composed of a lawyer, a physician, and representatives from labour, industry and agriculture where applicable. Appeal boards maintained offices and had paid clerical assistance, but members were not compensated for their services.

The decision of the appeal board was made on the basis of the record of the registrant which had been received from the local board, although the appeal board might ask the local board for more information. The appeal board's decision was final, except that another appeal, this time to the president, might be taken under certain circumstances. During the period in which an appeal was being taken, the induction of the registrant was automatically stayed.

The registrant, or any dependent of his, or any person who had filed written information relative to the registrant's occupational status within ten days after the mailing of the classification notice, might appeal to the president, provided that the registrant had been classified in Class I-A, I-A-O, or IV-E, and provided that one or more members of the board of appeal dissented from that classification. The ten-day period could be extended by the local board if it felt that the registrant failed to appeal because he did not understand his rights.

The registrant could not be inducted while an appeal to the president was pending, and when the appeal had been decided the registrant was notified of a continuance of classification or new classification, according to whether the appeal had been affirmed or denied. By the end of 1946, there had been approximately 68,000 appeals to the president, of which approximately 60% sustained the classification of the appeal board.

Generally speaking, age, occupation and dependency were the three chief factors bearing upon the classification procedure. Added to these considerations were, of course, statutory exemptions and deferments, as in the case of certain public officials, ministers of religion and conscientious objectors. Again, broadly speaking, the tendency was for younger men to be more desirable to the armed forces, and hence it was more difficult for them to obtain deferment. All three of the major considerations were interwoven in the classification process.

The Age Factor.—At the outset of Selective Service in Oct. 1940 men between the ages of 21 and 36 were, under the act, liable for military service; as a consequence, men

in this age group who were not otherwise eligible for deferment were forwarded for induction in the armed forces. On Aug. 16, 1941, congress limited induction to ages 21 through 27, and provided that men more than 28 could be released from active duty upon their request and with the approval of the secretary of war. At that time, there were 183,966 men more than 28 who could be released from the armed forces under this provision.

Liability for military service was extended to ages 20 through 44 on Dec. 20, 1941, when congress again amended the Selective Service act. This amendment also provided that the president could defer from training and service, by age group, men whose age was such that their deferment was advisable in the national interest. Less than a year later, Nov. 13, 1942, 18- and 19-year-olds were made liable for military service. Shortly thereafter, on Dec. 5, 1942, the age group acceptable for induction was reduced to ages 18 through 37. This age group continued to be the basis for classification until after the end of the war. On Aug. 15, 1945, the induction of men aged 26 and over was discontinued by executive order of the president.

During the postwar period, the age group for military liability was twice changed by the congress. On May 14, 1946, in extending the Selective Service act 45 days, congress limited inductions to men between the ages of 20 through 29. Public law 473, approved June 29, 1946, which extended the basic legislation to March 31, 1947, permitted inductions of men aged 19 to 44, inclusive, but by administrative action the upper age limit was retained at 29.

The age groups from which inductions were actually made at various times were as follows:

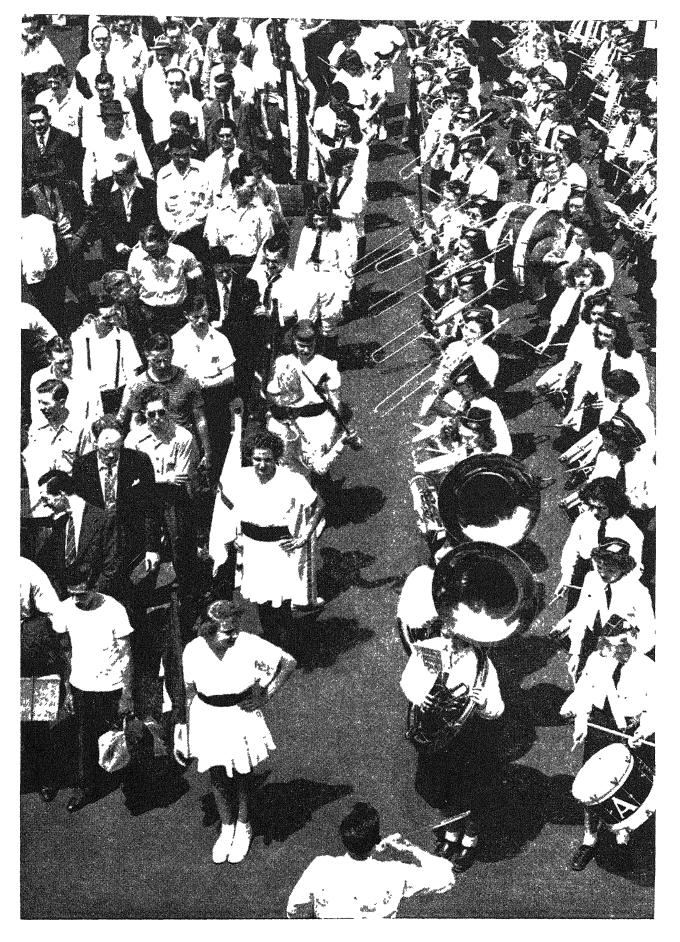

Period										Ages (inclusive
Sept. 16, 1940-Aug. 15, 1941										21-35*
Aug. 16, 1941-Dec. 19, 1941

*Congressional action.
†Administrative action (further limiting age groups previously set by congress).

Age had a bearing on occupational deferments, in that deferments for younger men for occupational reasons were much more stringent, beginning with the spring of 1944. In April of that year, three age groups were established within the ages then liable for induction: 18–25, 26–29 and 30–37. Men under age 26 faced rigid requirements in order to obtain occupational deferments; requirements were more liberal for each of the older groups in turn.

Age, as a factor in classification, was relatively simple, once the age limits had been established by law or policy. The great variables in classification, subject both to legislative action and administrative interpretation, and on top of that in the final analysis to local board interpretation, were dependency and occupation. No matter how carefully definitions were drawn it was up to the local board to decide in each individual case whether to grant deferment for occupation or dependency.

Occupational Deferment.—Occupational deferment was one of the most difficult problems which faced local boards in their classification meetings. If all physically fit men were forwarded for induction as their order numbers came up, industry would be forced to release workers it could not replace without a reduction of productivity. Since the production of war materials was important to the prosecution of the war, the total industrial productivity had to

be taken into account. Some men, because of their training and experience, were more essential than others to the continuing production of war goods. Not only in industry, but in other aspects the national health, safety and interest would be imperilled if men were inducted without regard to their civilian work. The order in which men were to be forwarded for induction was dictated by chance, by the instrument of the national lottery. But where chance interfered with essential production of war materials and food, and with the national health, safety and interest, the laws of chance had to be repealed by deferment policies, a factor recognized in the original legislation.

The Selective Service act authorized the president to "provide for the deferment of . . . those men whose employment in industry, agriculture, or occupations or employment, or whose activity in other endeavors, is found ... to be necessary to the maintenance of the national health, safety and interest." Thus there was left to the president to define the meaning of a "necessary" man, which was done in the initial regulations published a week after the act was approved. However, the act specifically placed occupational deferment on an individual basis, forbidding deferments by groups or occupations as a whole. It further provided that the deferment should cease when the cause for deferment no longer existed. No extensive changes in the act were made relative to occupational deferments immediately following the U.S. declaration of war in Dec. 1941. The first major change in the act occurred with the passage on Nov. 13, 1942, of the Tydings amendment, which provided that registrants found to be "necessary to and regularly engaged in an agricultural occupation or endeavor essential to the war effort . . . shall be deferred until a satisfactory replacement can be obtained."

In April 1943 a law was passed to establish procedures for deferment of federal government employees, by setting up a review committee to pass upon all requests for deferment by reason of federal government employment. Later that year, an amendment was enacted which in effect postponed the induction of 18 and 19-year-old high-school students for the remainder of a school year, if they were ordered to report for induction during the last half of an academic year.

One more wartime change was made in the original legislation, by an amendment approved Dec. 5, 1943, which specified that all occupational deferment cases should be submitted for review and classification to the appeal board having jurisdiction over the area in which the registrant was employed.

In addition to the changes made by legislation, administrative policies pertaining to occupational deferment underwent numerous changes during the course of Selective Service operations. At the outset, in 1940, only 900,000 men had to be selected during a year, and there were 17,000,000 from whom to choose. Even after deferments were granted those men specifically deferred by law, and nearly 10,000,000 men on dependency grounds, the occupational deferment regulation did not need to be drawn very tightly to yield the required numbers for training and service. Hence, the original regulation stated that a man was "necessary" in his civilian activity, when he was "engaged in such activity . . . could not be replaced satisfactorily because of a shortage of persons with his qualifications or skill . . . and his removal would cause a material loss of effectiveness in such activity."

In June 1941 a new class, II-B, was created, in which any registrant found to be a "necessary" man in the "na-

tional defense program" was placed. Class II-B deferments were given precedence over Class II-A deferments, in that those in II-B were not limited to a maximum duration, while those in II-A were to be for no more than six months, though the deferments might be renewed. In Feb. 1942 the designation of Class II-B was changed, since the United States had entered the war, to read "man necessary to the war production program," and a maximum limit of six months, subject to renewal, was placed on deferments in II-B, similar to the limit on II-A. Furthermore, renewal of deferment in either class was dependent upon the employer or the registrant convincing the local board that a replacement could not be found.

Provision for individual deferment by reason of both dependency and occupation was established April 23, 1942, with the creation of Class III-B, "in which . . . shall be placed any registrant with one or more dependents, and who is engaged in a civilian activity which is necessary to war production or which is supporting the war effort."

Two new classes were added Nov. 18, 1942, in order to carry out the provisions of the Tydings amendment providing for the deferment of agricultural workers. Local boards were informed that "In Class II-C shall be placed any registrant who has no grounds for deferment other than his occupation or endeavor and who is found to be necessary to and regularly engaged in an agricultural endeavor necessary to the war effort." Class III-C was established for agricultural workers who were also deferred by reason of dependency.

From the beginning, Selective Service operated on the principle that deferments were to be made by the local board on the basis of information available to board, but the War Manpower commission was created by executive order of the president in the spring of 1942 to co-ordinate all civilian manpower functions of the federal government with special reference to war production. At the same time, it became apparent that more detailed information was needed on each job and each worker in the most important manufacturing plants and industrial operations. In April 1942 Selective Service headquarters began helping local boards with their problem of granting industrial deferments by sending out lists of essential occupations which had been prepared with the advice of the war and navy departments and other federal agencies. The War Manpower commission continued this function, issuing directives and regulations concerning "the use and classification of manpower needed for critical industrial, agricultural and governmental requirements." Thus there was a general tightening up of occupational deferments. In March 1942 Selective Service headquarters sent local boards a comprehensive statement which started out "War has necessitated a revised determination of policy with regard to occupational classifications." The statement, in ten parts, dealt with the necessity of getting men for the armed forces and at the same time maintaining an adequate labour force for war production. Civilian activities in support of the "national health, safety and interest" were defined to include only those activities which directly supported the war effort, and "mere convenience and comfort" was excluded. Critical occupations and necessary men were discussed and defined, and a list of essential activities was included.

The number of men without dependents, who were deferred in Class II-A because their civilian occupation was essential to the national health, safety and interest, was 457,218 on Nov. 30, 1942. At the same time, 609,229 men without dependents were deferred in Class II-B because they were essential in war production. It should be noted that these did not comprise the total number of men who

had been deferred during 1942 for occupational reasons. Actually, the total would be much greater, since Classes II-A and II-B were actually a revolving pool, with men being moved in and out daily all over the country, by every local board. Totals of men deferred show only the men who happened to be in a deferred status on the day that the total was taken. Furthermore, the bulk of the nation's civilian manpower was still, in 1942, in Class III, deferred because of dependency.

The entire classification picture at the end of 1942 is shown in Table II.

Further controls over the manpower program were enacted in Nov. 1942 with the development of the Manning tables and replacement schedules for all major war production industries. The Manning table was, in effect, a report on the number and kinds of jobs and workers required in a given plant. The replacement schedule was developed following the introduction of the Manning table, to require employers to show what plans they had for training replacements for deferred workers, and to promote an orderly release of those workers who could be replaced so that they might take their places in the armed forces. By Sept. 1, 1943, there were more than 14,000 replacement schedules in operation. An estimated 10,000,000 employees were involved, listing some 1,600,000 employees as liable for induction under policies then in effect.

The Selective Service system was placed under the War Manpower commission by executive order of the president on Dec. 5, 1942. Volunteer enlistment of men between the ages of 18 and 38, requiring all male enlisted personnel between those ages for both army and navy to be inducted through Selective Service, was also stopped by this order. In the winter of 1943, Selective Service headquarters warned workers in occupations nonessential to the war effort to get into war production or lose their deferment for dependency.

In Dec. 1943 the Selective Service system was taken out from under the War Manpower commission. The total classification situation at the end of that year is shown in Table III.

Early in 1944, the president wrote the director of Selective Service:

The Nation's manpower pool has been dangerously depleted by liberal deferments and I am convinced that in this respect we have been overly lenient, particularly with regard to the younger men. . . . Deferments for industry include over a million non-fathers, of whom three hundred eighty thousand are under 26 years of age. Of almost a million non-fathers deferred in agriculture, over five hundred fifty thousand are under 26. Agriculture and industry should release the younger men who are physically qualified for military service. The present situation is so grave that I feel the time has come to review all occupational deferments with a view to making available the personnel required by the aimed forces.

Local boards were asked to review the cases of all occupationally deferred registrants, with particular attention to those under 26 years of age. Deferment for those between the ages of 18 and 21 was virtually eliminated, with the exception of men in agriculture. To be deferred, these men had to be regularly engaged as necessary men in essential war production, and recommended by the state director of the state in which they were employed. In March this policy was extended to include men aged 18 through 25. There was continued pressure from all sides to meet calls from the armed forces for men.

In April 1944 the war and navy departments announced that they had reached their planned strength, but the war department announcement added:

Inductions through Selective Service must continue, however, with the emphasis on young men who are needed to replace losses due to combat and to normal attrition. . . . It is essential that from seventy-five thousand to one hundred thousand men be inducted each month to maintain the strength of seven million seven hundred thousand. This means that the army will need from seven hundred thousand to a million men during the remainder of 1944.

As a result of this expressed need for younger men, Selective Service postponed induction of men 26 years and older who were making a contribution to essential agriculture, war production or war supporting activities, until the induction of those under 26 had been substantially completed. Hence, the rigid requirements for occupational deferments for registrants in the 18 through 25 year old group remained in effect. Men aged 26 through 29, who were found to be necessary to and regularly engaged in war production or a war supporting activity "had the prospect," local boards were told, "of remaining in civilian life for the time being, subject to adjustment as the needs of the armed forces change." The prospect for men 30 through 37, the announcement continued,

regardless of their physical condition . . . who are regularly engaged in and who remain in activities in war production or in support of the national health, safety and interest, is that they will remain in civilian life for an indefinite period, subject to adjustment as the needs of the armed forces change.

The manpower situation as of Dec. 31, 1944, is shown in Table IV.

While at the beginning of 1945 ultimate victory was considered likely, the immediate military situation was not

favourable to the Allies. The Germans had broken through in the Ardennes during Dec. and had inflicted serious losses. President Roosevelt told congress, Selective Service and the public that all physically fit men under 30 who could be spared from war production must be inducted to meet the urgent needs of the fighting forces, and that their places in the production lines must be taken by older men, those unacceptable for military service and women.

Local boards were advised that there should be the "least possible" number of deferred men in the age group 18 through 29, and that men who left the position for which they were deferred without convincing the local board that the change would benefit the war effort were to be forwarded for immediate induction. The boards were informed that the army physical standards applied to these men would be drastically lower than the standards for general military service.

By March 1, 1945, about one-half of the 22,000,000 registrants 18 through 37 years old had been inducted or had enlisted. About 25% were unavailable for military service because of physical disability, extreme hardship to dependents or statutory exemption. Of the remaining 25%, comprising about 6,314,000 men, more than four-fifths (5,251,000) were deferred in essential occupations; 62,000, mostly 18-year-olds who had just registered, were unclassified, and about one-sixth (1,001,000) were in the I-A classes, available for military service. Only 106,000 of those occupationally deferred were under 26 years of age.

After the end of the war in Europe, in May 1945 the need for young men continued, but local boards were asked to liberalize occupational deferments for men more than 30 years of age, particularly fathers, and to review the cases of previously rejected registrants under 26, to see whether some of these men might be acceptable for general or limited service.

With the surrender of Japan in Aug. 1945 manpower needs of the army and navy were reduced to replacements for war veterans of long service and those with dependents. The services had, following the end of the European war, instituted a point system of demobilization, based on total length of service, overseas service and campaigns, and number of children. President Truman lowered monthly calls on Selective Service and reduced the top age of acceptability for induction from 38 to 26 years. Class II-B, for registrants deferred because they were necessary to and regularly engaged in war production, was eliminated on Sept. 4, and men classified II-B were transferred to class II-A, which contained registrants deferred because they were necessary to and regularly engaged in an activity in support of the national health, safety and interest. Also in September, provisions were announced that students who entered high school before they reached the age of 18, might have their inductions postponed until they graduated, or reached the age of 20, whichever was the earlier, provided their course of instruction was pursued continuously and satisfactorily.

The manpower situation at the approximate end of the war, as of July 31, 1945, is shown in Table V.

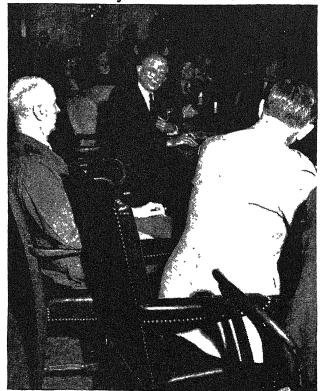

Occupational deferment policies in effect after the end of the war remained virtually the same until July 1946 except for minor changes granting consideration to scientific and technical personnel and students. In July Selective Service headquarters informed local boards that in order to meet war department calls for men it would be necessary to "limit occupational deferment to those few

registrants who are determined by the local boards to be indispensable and irreplaceable to the national existence except that registrants in agriculture will continue to be considered for deferment under the provisions of the Tydings Amendment." College students could no longer obtain a stay of induction to complete a semester or quarter, it was announced.

Dependency Deferments.—The third chief factor in classification, in addition to age and occupation, was dependency. It was paramount in U.S. thinking about Selective Service that single men without dependents should be

Joint session of the U.S. senate and house military affairs committees at which Senator Burton K. Wheeler (centre) opposed the drafting of U.S. fathers in 1943

the first to be called, and that those with children should be the last. The Selective Service act provided (Section 5[e]) that "The President is authorized to provide for the deferment . . . of those men in a status with respect to persons dependent on them for support which renders their deferment advisable."

The original regulations prescribed in 1940 defined and elucidated this provision for the guidance of local boards, advising them to classify in Class III (deferred for dependency) "any registrant upon whom one or more dependents ... depend for support in a reasonable manner: Provided, however, that it is not advisable to defer any such registrant if he acquired such status for the purpose of avoiding training and service, and therefore no registrant should be placed in Class III it he acquired such a status after the day when he was required to be registered," except for special cases which proved to be within the "course of human affairs," and not to provide the registrant with a basis for delerment. To be considered as a dependent, the regulations stated, a person had to be either (1) the registrant's wife, child, parent, grandparent, brother or sister, or (2) a person under 18 years of age, or a person of any age who was physically or mentally handicapped and whose support the registrant has assumed in good faith. The dependent, at the time the registrant was classified, had to depend "in fact" for support in a reasonable manner on income earned by the registrant by his work.

The term "child" was defined to include an unborn child, one legally adopted or born out of wedlock. The terms "child," "brother" and "sister" were defined to include only persons under 18 years of age unless physically or mentally handicapped.

As a consequence of these provisions, only unmarried registrants were forwarded for induction during the first two years of Selective Service operations. While dependency, as defined and limited in the act, was the basis for deferment rather than marriage, it was recognized that most "dependencies" grow out of marriage, and it was further recognized that there were other than financial problems involved, even though that was the only aspect of dependency recognized by the law. On the other hand, Selective Service local boards were aware that marriage could be used as a means of avoiding training and service, and took this factor into consideration.

As early as April 1942 Selective Service headquarters began looking at Class III with an idea of the imminent need for taking men from this group. Local boards were running out of single men, and needs of the armed forces were increasing. Accordingly, the first step was taken April 23, 1942, when Class III was divided into two classes, and registrants who were deterred for dependency alone were placed in Class III-A; in Class III-B were placed those registrants who had dependents and were also "engaged in a civilian activity which is necessary to war production or which is supporting the war effort." Thus, for the first time, dependency and occupation were combined as bases for deferment, although, unlike those registrants in Class II-B, deferred for occupation alone, Class III-B registrants did not have to qualify as "necessary to" the civilian activity in which they were engaged, only that they be engaged in an occupation which was itself necessary to the war effort.

On June 23, 1942, the whole concept of dependency deferment was changed, with the enactment of the Servicemen's Dependency Allowance act of 1942. It provided for the payment of monthly family allowances to the dependents of enlisted men in the lower four grades, consisting of contributions by the government and the enlisted man

from his pay. The total allowance amounted to \$50 a month for a wife, plus added amounts for children. There were corresponding provisions for other dependents, including parents, brothers and sisters or grandchildren, who had been dependent upon the enlisted man for a substantial portion of their support.

Thus, there was eliminated at least some of the basis for deferment on the grounds of financial need of dependents and that section of the Selective Service act dealing with the definition of dependency was amended accordingly. However, the new amendment pointed out that payments of allowances "shall not be deemed conclusively to remove the grounds for deferment when the dependency is based upon financial considerations." Furthermore, the amendment went on to state there might be grounds for dependency deferment which were other than financial. Finally, the president was authorized to provide for the deferment of "any or all categories of those men who have wives or children, or wives and children, and with whom they maintain a bona fide relationship in their homes." Under the new Selective Service regulations it was provided that a registrant's claim for a dependency status "must have been acquired prior to December 8, 1941 or at a time when the registrant's selection was not imminent."

Registrants with wives but no children, and those with collateral dependents only, began to be forwarded for induction during the middle part of 1942.

During 1943, the entire problem of dependency as a basis for deferment from training and service was debated in the halls of congress, in the press and among the general public. Ultimately, on Dec. 11, dependency as a factor in deferment was practically discontinued, except for cases of extreme hardship. Early in 1943 it became apparent that fathers would have to be made available for induction, if calls were to be met. Bills were introduced in both house and senate during the spring of 1943 on the question of inducting fathers. Inductions began to be short of calls in April, and by July Selective Service was lagging one-third in meeting demands of the armed forces. On July 31, 1943, the director of Selective Service asked local boards to begin reclassifying fathers for induction, though none was actually to be forwarded before Oct. 1. In the meantime, the term "father" had been defined by Selective Service as a registrant who maintained a bona fide family relationship with his child or children in their home, provided such status was acquired prior to Dec. 8, 1941. A child was defined to exist from the date of conception, and a child born before Sept. 12, 1942, was regarded as qualifying the registrant for claim to dependency status.

In Sept. 1943 a local board inventory determined that there were not enough men in other available categories to postpone inducting fathers after Oct. 1. Accordingly, local boards were directed to commence forwarding fathers for induction, and the process began very slowly in October. On Dec. 5, 1943, congress amended the Selective Service act to stipulate that

registrants shall, on a Nation-wide basis within the Nation and on a State-wide basis within each State, be ordered to report for induction in such manner that registrants, regardless of their occupations or the activities in which they may be engaged, who were married prior to December 8, 1941, who have maintained a bona fide relationship with their families since that date and who have a child or children under 18 years of age, will be inducted after the induction of other registrants not deferred, exempted, relieved from liability, or postponed from induction under this Act or the rules and regulations prescribed thereunder who are available for induction and are acceptable to the land and naval forces.

Applied to practice, this meant that local boards were to fill the calls with nonfathers insofar as they were available and to fill the remainder of the calls with fathers. Local boards still remained reluctant to forward fathers for induction, and it was not until June 1944, nine months after the induction of fathers was directed, that the monthly call was filled completely. The percentage of fathers inducted ranged from a low of about 7% of the total inductions in Oct. 1943 to more than 52% in April 1944, after which the proportion gradually decreased. This decrease was due in part to a reduction in the size of the calls and to the demand of the armed forces for younger men, a demand which was the cause of more stringent occupational deferment policies.

From Nov. 1944 to May 1945 the numbers and proportions of fathers inducted increased somewhat, to a high of nearly 45% of the total monthly inductions in April 1945—the result of a virtual depletion of available registrants in the 18 through 25 year age group, and the increase in the calls resulting from events on the European front, during the battle of the Bulge late in 1944.

After May 1945 inductions of fathers tapered off, and on Nov. 5, 1945, fathers of three or more children were relieved from eligibility for induction. At this time the so-called "pre-Pearl Harbor father" definition became obsolete, and fatherhood, in Selective Service usage, did not de-

pend upon any date. A month and a half later, on Dec 19, all fathers were relieved of liability for induction. During the entire period in which fathers were being inducted Oct. 1, 1943, to Dec. 19, 1945, the total number inducted was 944,000 or slightly more than one-tenth of the registrants listed as fathers on the local board inventory in Sept. 1943. The number of fathers inducted was also about one-tenth of the total number of men inducted throughout the entire period of the war.

The induction of fathers was specifically prohibited by congress in both extension acts of 1946.

Physical Examinations and Rejections.—Men inducted, the Selective Service act specified, had to be acceptable to the land and naval forces. This was a departure from the 1917–18 practice, when Selective Service inducted the men who had been selected. In 1940–46, Selective Service selected the men and sent them to the land and naval forces, where they might be accepted or rejected.

At the outset, Selective Service undertook a complete examination of every registrant, under war department standards. This work was accomplished by volunteer examining physicians, and later dentists, attached to each local board. As a result of the examination, registrants were classified as fit or unfit for service, and those found acceptable were ordered to report for induction as their order numbers came in sequence. However, all registrants

With his back to the wall, Gen. Dwight Eisenhower listened, in Jan. 1946, as G.l. wives demanded that their husbands be demo-

"Green Light," a cartoon by Shoemaker in the Chicago Daily News echoing Gen. Eisenhower's opinion that extension of the draft was necessary to secure the peace. In June 1946, the Selective Service act was extended to March 31, 1947

were again examined at the induction station, and it developed that from 10% to 30% of those who had been previously pronounced acceptable for service were turned down by induction station doctors. Part of this discrepancy was due to the time lapse between the two examinations, often several months, and the rest to differing interpretations of the standards. The hardship and inconvenience to registrants who had been found fit for service and had made plans accordingly and were later rejected, required drastic revisions in the examination procedure.

By early 1943 the physical examination at the local board level consisted only of a screening type examination, by which it was sought to eliminate from further consideration those registrants with obviously and manifestly disqualifying defects. Only one complete physical examination was given, at the induction station. This plan eliminated duplication and conflicting decisions, but not the period of waiting and uncertainty after the registrant was classified "I-A" by his local board and before he was finally accepted or rejected for service at the induction station. This period might be several months, and during that time these men were not only unable to make their plans, but they were a liability in the whole manpower picture since employers were unable to count on their services. Problems of the local boards were increased as well by this plan because in order to be certain of sending enough men to fill the call, the boards had to send sometimes as many as 50% more men than the call to allow for probable rejections. Hence, the plan for preinduction physical examination was developed.

Under this arrangement, all "I-A" registrants were examined at the induction station as soon as possible after their classification, and without relation to the possible date of their being forwarded for induction. Then if they were rejected at the induction station, they were reclassified accordingly; and if they were accepted, they were re-

tained in "I-A" and could look forward to probable future induction.

This plan was in use during the balance of the period, though it still did not eliminate the element of uncertainty entirely, since a registrant accepted and found fit for military service at the preinduction physical induction examination might still be rejected in the final examination at induction, and sometimes as many as 10% of those previously found acceptable were so rejected.

During the period from Oct. 1940 to Nov. 30, 1946, an estimated 20,000,000 men forwarded by Selective Service

Table VI.—Physica	Rejections by	Occupational	Group
-------------------	---------------	--------------	-------

Occupational Group	Total	White*	Negro
All occupations	42.6	40.3	56.1

were examined for military service; some 16,000,000 were found acceptable.

Selective Service made a comprehensive study based on a 20% sample of the results of the physical examinations of more than 9,000,000 men examined between April 1942 and Dec. 1943. During the period covered by the study, rejections ranged from 31.4% in Jan. 1943 to 46.9% for Dec. 1943 with an over-all average for the period of 36.4%. The rejection rate increased directly in relation to age of the registrants, reaching a rate of slightly more than 50% at age 34 and more than 67% at age 46.

Table VII.—Principal Causes for Physical Rejection

Causes	Number	Percent
Total	4.828.000	100.0
Manifestly disqualifying defects	510,500	10.6
Mental disease	856,200	17.7

Selenium

Salient statistics of selenium in the United States and Canada during 1937–45 were as follows, in thousands of pounds:

							United States				Canada
							Production	Sales	Stocks	Imports	Production
1937							436	283	306	93	39 <i>7</i>
1938							226	166	365	101	359
1939							227	346	247	125	368
1940							329	369	207	134	180
1941							620	682	146	198	407
1942							506	317	342	84	495
1943								522	456	82	374
1944								424	51 <i>7</i>	98	299
1945					:			666	393	219	419

Since selenium is recovered as a byproduct in copper refining, output was determined more by the demand for copper than for selenium itself. During most of the years of World War II output was ahead of demand, and stocks increased. In 1945 production and sales increased sharply in spite of record imports, giving an available supply ahead of anything previously recorded. All of the U.S. imports continued to come from Canada.

Several other countries with electrolytic copper refineries recovered small amounts of selenium, but no production data were available. The most important uses for selenium were in rubber compounding and glass making. Selenium produces a heat-resistant rubber; in glass small quantities are used as a decolorizer, to remove the greenish tint caused by iron; larger amounts give a pink tint, and still more, along with cadmium, gives a ruby colour. Small amounts in stainless steel and copper alloys improve machineability. Selenium is used in pigments and is a constituent of certain types of alternating current rectifiers and photoelectric cells. (G. A. Ro.)

Semantics

Semantics may be defined as (1) In modern logic, the study of the laws and conditions under which signs and symbols, including words, may be said to have meaning, and the study of the kinds of meanings possible to be conveyed; semiotic; (2) The study of human responses of signs and symbols; the study of the relationship between words and things, between language and behaviour; significs.

The decade 1937–46 saw a continuation and intensification of the intellectual confusion and the conflict of values characteristic of the years following World War I. Philosophic and moral scepticism was, in the years of the depression, aggravated by political and economic doubts. A marked tendency of thought from the middle '30s on was a progression beyond the simpler scepticism of the '20s (the decade of the "debunkers") to a higher scepticism. One form which this higher scepticism took was the tendency to go beyond the critical examination of accepted facts and beliefs to the examination of the mechanisms by means of which facts and beliefs are given form, namely, language and symbolism.

Furthermore, the rise of Adolf Hitler had shown, among other things, the amazing power of radio and a controlled press as instruments for organizing and directing public

opinion. The knowledge that the powerful modern instruments of communication, instead of being used for enlightenment, could be and were being used to arouse dangerous mass hysterias, brought many U.S. educators to an alarmed sense of their responsibility to try to prevent the occurrence of any such phenomena in the United States. Such factors as the success of Father Charles E. Coughlin on the radio and the knowledge of the increasing concentration of ownership and control of the means of mass communication contributed to their sense of urgency. Among the results of this concern were a marked development of scientific research into public opinion and the introduction into many colleges, universities and high schools of courses of study variously labelled public opinion, propaganda analysis, communications study, etc. In 1937, the journal Public Opinion Quarterly was founded at Princeton university, and the Institute for Propaganda Analysis (which suspended operations in 1940) was founded at Teachers college, Columbia university, by Professor Clyde R. Miller. Propaganda analysis, when pursued at anything beyond the most superficial level, also became a concern with the mechanisms by means of which facts and opinions are given form—language and symbols.

Both the temper and the needs of the decade therefore led to enquiry into language and symbolism. But such enquiry had hitherto been a highly theoretical and little-known branch of learning, cultivated principally by philosophers, by mathematicians with a philosophical turn of mind or by linguistic theorists. When the popular writer on economic topics, Stuart Chase, published his entertaining Tyranny of Words in 1938, he performed the exceedingly useful service of bringing to the attention of a public bewildered by controversy and propaganda the existence of the abstruse theoretical literature of semantics, which, he said, was just what was needed to introduce some sanity and order into public discussion.

It is possible to trace semantics back to the Greeks if one wishes to, but modern semantics can be said to originate in Lady Viola Welby's "significs" ("the science of meaning or the study of significance, provided sufficient recognition is given to its practical aspect as a method of mind,") and in Bertrand Russell's and A. N. Whitehead's Principia Mathematica (1910). Lady Welby found that the study of the complete interpretive act, including insight into motivation and ethical evaluation was necessary, as opposed to the study of meanings as a purely verbal discipline. She perceived, as Alfred Korzybski was later to emphasize, that civilizations had been content to retain modes of speech which had become totally inadequate. She also perceived grave shortcomings in the habits of interpretation inculcated by the educational methods ("senseless formalism" and "barren controversy") of her times.

Russell's and Whitehead's concern was with the foundations of mathematics. In trying to solve certain apparently inescapable logical contradictions, they proposed the theory of types, the principal point of which was that ambiguities of language conceal certain "illegitimate totalities," which, when undetected, lead to "vicious circle tallacies." For example, need a statement about all statements apply to itself? The statement in the following parentheses illustrates this type of proposition: (All statements in these parentheses are false). If we suppose the statement true, then we must conclude that it is false; if we suppose it false, we must conclude that it is true. The "all" in such propositions is the "illegitimate totality." The "all" must be limited so that a statement about that totality must itself fall outside the totality.

Russell and Whitehead were exceedingly influential. No small part of the achievement of the logical positivist or physicalist school of philosophy (the "Vienna circle") was due to the stimulus which they gave to the analysis of language. Ludwig Wittgenstein, a leader of this school, showed through logical analysis that practically all the traditional problems of philosophy were, from this point of view, "senseless," and that most philosophic propositions arose from the lack of understanding of the "logic of our language." This school contributed much to semantics by distinguishing sharply the various functions of language, by pointing out the kinds of statements which are of necessity impossible to verify and therefore fruitless to discuss and by showing that another large class of utterances turn out on analysis to be statements not at all about reality, but about language. The "logical syntax" of Rudolf Carnap attempted to show that, properly speaking, the only philosophic method was the analysis of the form and rules of language. In 1938 a group of logical empiricists, as philosophers of this general persuasion also called themselves (Otto Neurath, Niels Bohr, Bertrand Russell, John Dewey, Rudolf Carnap, Charles W. Morris), started the publication of the International Encyclopedia of Unified Science, a series of studies based on the conviction that an adequate theory of signs would provide the basis for the ultimate unification of knowledge by the study of the relationships of the languages of the special sciences to each other, and of the relationships of scientific language to the languages of other areas of human activity. An ambitious later attempt to state the foundations of a theory of signs was Charles W. Morris' Signs, Language, and Behavior (1946).

Another semantic development was the increasing influence of the operationalism of P. W. Bridgman-a theory which held that the meaning of scientific statements lay solely in the operations involved in verifying them, and that if no operations, actual or theoretical, could be employed in the testing of a statement, such a statement was to be regarded as meaningless. It was not coincidence, but a revealing symptom of the needs of the times, that almost identical ideas were being expounded in such an apparently unrelated field as the law. "Our legal system is filled with supernatural concepts, that is to say, concepts which cannot be defined in terms of experience and from which all sorts of empirical decisions are supposed to flow," wrote Felix S. Cohen in 1935. "Against these unverifiable concepts modern jurisprudence presents an ultimatum. Any word that cannot pay up in the currency of fact, upon demand, is to be declared bankrupt, and we are to have no further dealings with it." Owing much inspiration to Oliver Wendell Holmes (who made a profound contribution to semantics in his famous remark, "The prophecies of what the courts will do in fact, and nothing more pretentious, are what I mean by the law"), modern students of law of the "functionalist" and "legal realist" schools (Morris R. Cohen, Jerome Frank, Thurman Arnold, Karl Llewellyn, Glanville Williams and others) steadily increased their strength, although, in a field more permeated with transcendental concepts and fictions than any other learned profession, their influence was of necessity slow.

In literary circles the examination of meaning was deeply influenced by I. A. Richards, whose Principles of Literary Criticism (1924), Practical Criticism (1929), Interpretation in Teaching (1938) and How to Read a Page (1942) stimulated a revival of interest in the accurate explication of texts. Hugh R. Walpole's Semantics (1941) and F. A. Philbrick's Understanding English: An Introduction to Semantics (1942) also contributed to this interest, the former be-

ing especially concerned with translating texts into basic English as Richards had suggested, in order to understand them better and to lay bare problems of meaning. In one sense, however, Richards and his school, because of their relatively limited literary and pedagogical concerns, disappointed the expectations aroused by Richards' earlier book (written with C. K. Ogden), The Meaning of Meaning (1921), which was a brilliant continuation of the study of significs initiated by Lady Welby. This earlier work, however, continued to be influential in legal, scientific, sociological and philosophical thought.

Anthropological researches into language initiated earlier by such men as Leonard Bloomfield, Edward Sapir and Bronislaw Malinowski continued to provide material for semantic thought in the findings of such scholars as Benjamin Lee Whorf (1897–1941) and Clyde Kluckhohn. Increasingly, examination of the language and behaviour of speakers of non-Indo-European languages confirmed the observation made by earlier semanticists that language, far from simply expressing thoughts, actually determines the character of the reality one apprehends. Furthermore, anthropologists gave added evidence supporting the semantic principle that linguistic events are not to be studied in isolation, but in relation to the whole of the behaviour, the social forms and the antecedent and subsequent non-linguistic events which constitute their total context.

The assault against meaninglessness; the determination to build new syntheses on simpler, less metaphysical and more functional principles than had been inherited from past systems; the searching enquiry into the legitimacy of traditional systems of language and symbolism-these were the tendencies the decade 1937-46 called semantics. The fact that these tendencies were strong in the decade even outside the semantics movement was revealed in other fields, e.g., in architecture and art, where Frank Lloyd Wright's long war against meaningless symbols and forms (pillars supporting nothing, false fronts, sham mediaevalism) came perceptibly closer to final victory, and in the theories of such abstractionists as Gyorgy Kepes (Language of Vision, 1945) and L. Moholy-Nagy (The New Vision, 1946) who, explicitly rejecting the traditional symbolisms of artistic representation, sought a new "language" of vision by means of an analysis of the fundamental psychophysiological events that constitute visual experience.

The most ambitious and more controversial, however, of all the systems of semantics being evaluated, discussed and applied during the decade was that known as general semantics.

General Semantics.—General semantics is the name which Alfred Korzybski, Polish-U.S. scientist and engineer, gave to a new educational discipline, the purpose of which was to make the methods of modern science the basis for everyday living. Like other modern students of language, Korzybski regarded the language of everyday life as permeated with prescientific and primitive beliefs and assumptions. He went further than others, however, in studying the consequences of this fact. Error and confusion in intellectual life were, to him, serious but relatively superficial consequences of prescientific language. He found even graver consequences in the fact that moment-to-moment behaviour and reactions are determined to a large degree by the prescientific assumptions embedded in language.

Korzybski introduced his system in 1933 in his Science and Sanity: An Introduction to Non-Aristotelian Systems and General Semantics. In calling his discipline general semantics (the term semantics was coined by M. Bréal in

1897 and is derived from the Greek, semaneien, "to signify"), he stated its goal as the achievement, in science and thought, of "non-Aristotelian orientations," and in everyday life, of a "non-Aristotelian orientation." In calling his goals non-Aristotelian, he was at once paying tribute to Aristotle as the individual who had had more influence than anyone else in the systematization of thought in western culture, and stating the limitations of Aristotelian traditions for modern times—just as mathematicians, in speaking of non-Euclidean geometries, at once paid tribute to Euclid and stated their claim to have gone beyond him.

The aim of general semantics was not, therefore, simply to point out errors of fact, opinion or logic, i.e., to correct verbalizations. The metaphysics which men hold, their theories of knowledge, their philosophies, Korzybski believed, necessarily end up in their nervous systems as involuntary, or almost involuntary, patterns of reaction. The Indo-European languages categorize events in parts of speech such as nouns, verbs and adjectives, and form propositions by means of them. This language structure, based on the unconscious philosophical assumptions of primitive people, still shapes everyday speech and thought. Within the area of special sciences, each with its own language, men had succeeded to some degree in escaping the primitive structure of their language. In everyday life, however, patterns of reaction were still largely governed by the metaphysics of our linguistic ancestors. The problem then, as Korzybski regarded it, was to enable an escape from that tyranny by making mistaken assumptions conscious, and by substituting as a basis for daily living the assumptions of modern science.

Like the anthropological linguists, Korzybski was not willing to regard Aristotle's laws of thought as in any sense final. He deplored the followers of Aristotle who, regarding the Aristotelian laws as universally valid, had made them the basis of education in western culture. He felt that western philosophical tradition, predominantly Aristotelian, had reinforced the influence of language in making prescientific philosophies the basis of reaction patterns. Consequently, he named those age-old reaction patterns the Aristotelian orientation, and set out to uproot them in favour of his non-Aristotelian orientation, by which he meant patterns of reaction more general in character, not limited by the accidents of particular language structures.

Science is a social and linguistic product, the result of cooperative endeavour made possible by observations accurately made and by communications accurately given and understood. Korzybski had remarked earlier, in his Manhood of Humanity (1921), on the vast difference existing between those areas of human thought, such as science and technology, in which progress had been rapid and grew even more rapid with each new success, and those areas, such as philosophy, ethics and politics, in which confusion remained general and progress often appeared impossible. To him this contrast between progress and stalemate was crucial. In Science and Sanity, he attributed this difference to the non-Aristotelian orientations general in the sciences and the Aristotelian orientations general in other fields. With the attainment of non-Aristotelian orientations in economic, social, political, moral and personal life, Korzybski believed western culture would overcome its most serious cultural lag, namely, the much-deplored failure of social wisdom to keep pace with the progress of technology. His proposal of general semantics as a discipline for the attainment of this end constituted, there-

fore, the manifesto of a cultural revolution of the most ambitious kind—a proposal that practically the whole of western culture be born again.

General semantics was based on an extraordinarily broad survey of diverse fields of knowledge, among them mathematics, mathematical logic, mathematical physics (quantum mechanics, relativity theory), biology, neurology, colloidal chemistry, the various schools of psychology (Freud, Jung, Adler, Adolf Meyer, behaviourism, the Gestalt school) and psychiatry. In each of these he examined tendencies of thought, the evaluative habits, the methods of approaching problems. It should be explained here for the benefit of the nonscientific reader that each of these fields was either new, or had made revolutionary progress, in the twentieth century. In each of them dogmas and assumptions which had been held unquestioned for centuries had been overthrown-in physics, such basic concepts as those of space, time, and matter; in psychology, the traditional notions of mind; in social thought, the traditional beliefs about the differences between savage and civilized men; in logic, the belief that propositions had to be either true or false, etc.

General semantics, then, was a summary, in a few simple and general formulations, of the basic habits of evaluation which Korzybski believed to be common to the most advanced contemporary thinkers-just as Aristotle's laws of thought were in his time a descriptive summary of the habits of thought of his contemporaries. The modern habits of evaluation appear to rest, Korzybski said, on three fundamental non-Aristotelian premises. Comparing the relationship of language (as well as of thought, memory, mental images) to reality with the relationship of maps to the territories they represent, he laid down the following premises: (1) a map is not the territory (words are not the things they represent); (2) a map does not represent all of a territory (words cannot say all about anything); (3) a map is self-reflexive, in the sense that an ideal map would have to include a map of the map, which in turn would have to include a map of the map of the map, etc. (it is possible to speak words about words, words about words about words, etc.; in terms of behaviour this means that it is possible to react to our reactions, react to our reactions to our reactions, etc.).

These three premises, Korzybski said, arose directly out of Russell's and Whitehead's theory of types. He stated further that they had to be understood in neurological terms, instead of being left simply in the realms of mathematical theory. Understood neurologically, they could, he argued, be translated into behavioural reactions. In order to accomplish this translation, he offered a set of rules to govern language, thinking, behaviour and attitudes. Appropriating from formal logic the term "extension," which means the aggregate of things denoted by a term (as opposed to "intension," the qualities or properties implied by a term), he called his rules extensional devices. They were as follows:

1. Indexes. Words lump together unique individuals under a common name. In nature no two things are identical. Names give a false impression of identity to non-identical objects and events, and this impression when translated into behaviour results in uniform, identical reactions to all individuals to which the same name can be given. For example, some persons have fixed reactions to "Republicans," "unions," "subsidies," etc. Hence, the practice of adding index-numbers to all our terms serves as a reminder of the uniqueness of all individuals: Republican₁, Republican₂ . . . subsidy₁, subsidy₂ . . . etc. Indexes remind us that there are differences as well as similarities among individuals of the same name.

2. Dates. Heraclitus said that you cannot step into the same river twice. The world and everything in it is in process of change. But many behaviour patterns, opinions, beliefs, tend to remain fixed and static in spite of changes in circumstances. "Maps" of yesterday are used as guides to the "territories" of today. All terms, statements, opinions and beliefs should therefore be dated: Supreme Court 1946, Supreme Court 1947. . . John Smith Monday. John Smith Tuesday . . . This principle also takes into account the fact that the same object or individual is different in different environments: e.g., violin (rainy day) is not identical with violin (dry day). The habit of dating all terms and statements, when translated into patterns of reaction and behaviour, makes rigidity of attitudes impossible and a dynamic time-minded orientation habitual.

3. Et cetera. All statements should be accompanied by an implicit "et cetera," to remind one of the second premise, namely, that "maps" do not represent all the "territory." The habitual et cetera prevents dogmatism, since it is a constant reminder that, language being the product of an abstractive (selective) process, no statement about events or objects in the real world can ever be final. This rule induces what Korzybski called "permanent consciousness of abstracting."

4. Quotation marks. Many terms in everyday language have pre-scientific metaphysical or structural implications. However, ordinary vocabulary often contains no better terms. Hence such terms ("mind," "substance," "objective," "subjective," "same," etc.) should be used in quotation marks to remind us that they are not to be trusted.

5. Hyphens. Traditional language separated verbally many things that cannot actually be separated. A revolution in physics was accomplished by Einstein's demonstration that space and time cannot be separately considered and that one should think in terms of space-time. Similar revolutions were going on in other fields, as in psychosomatic medicine, which does not separate physical and mental disorders; and in bio-physics, which offers general methods for dealing at once with the living and the nonliving. Terms such as psycho-biological, socio-cultural, psycho-social, geo-political and socio-economic in the sciences of human behaviour also show the new orientation. The use of such hyphens sharpens the awareness of the inter-relatedness of events which traditional language treated as unrelated. Indeed, hyphens often reveal that what seemed to be two or more separate events can more fruitfully be regarded as different aspects of the same event.

Korzybski did not intend these extensional devices simply as things to say by rote or to sprinkle through one's writing. Each of them was intended to point beyond itself to subverbal levels-to observing and feeling and absorbing as directly perceived data the nonlinguistic actualities distorted by language. Nevertheless, a common error among the general public regarding general semantics was the tendency to regard it as some kind of purely intellectual discipline (like defining one's terms) incapable of touching one's emotional life. This misunderstanding was due in part to earlier definitions of semantics as the science of meanings, but it was due even more, as Korzybski often pointed out, to one of the very errors his extensional devices were intended to correct, namely, the habit of separating the intellectual and the emotional into discrete categories. The use of the devices was intended as a discipline of (to use the prescientific terms) the senses, the emotions, and the mind-or to use modern terms-a discipline of the "organism-as-a-whole." Continued practice in the use of the devices would, Korzybski claimed, gradually liberate the individual from his Aristotelian orientations and make a modern man of him—a non-Aristotelian.

A unique feature of general semantics was that it offered, for what its originator believed to be the first time in scientific history, a positive, functional theory of sanity. The extensional devices were purported to describe not only how the best scientific minds do work, but how all liuman minds ought to work. Here Korzybski made use of his study of the mentally ill, as well as of his studies of political controversy, philosophical disputation and other areas of stalemate. In these areas he found lack of indexing (e.g., confusion of words with things, prejudices), lack of dating (inflexibility, adherence to outworn notions), lack of consciousness of abstracting (treating verbal worlds as realities in themselves; dogmatism), reliance upon wordmagic and incantation, and other violations of his rules to be extremely common. To thinkers on political and ethical problems he therefore proposed systematic application of his extensional devices as a way of helping to make their fields scientific. To psychiatrists, he proposed them as a basis for the re-education of patients.

If sound, a positive theory of sanity could not but be regarded as a tremendous contribution to science. Both psychiatrists and cultural anthropologists, finding certain patterns of behaviour normal in one culture and abnormal in others, had difficulty in offering grounds for preferring, in any general sense, some behaviour patterns over others. In the light of general semantics, however, any widespread "lack of consciousness of abstracting," any systematic failure in indexing (e.g., race prejudice), any over-valuation of symbols at the expense of the realities symbolized (e.g., preoccupation with money rather than with the economic actualities of goods and services), in individuals or in cultures, could be described as blocking the full development and utilization of human evaluative resources, and therelore from an engineering point of view as undesirablein short, unsane.

During the decade 1937-46, the number of individuals willing to concede that general semantics was all that Korzybski claimed it to be increased steadily. Whatever the shortcomings of the system, there was no question that it was one of the most impressive intellectual syntheses yet produced in the 20th century, purporting as it did to be at once a science of sciences, a value theory (theory of sanity), a new system of education capable of being introduced even to the very young (e.g., indexes and dates could be taught to kindergarten children), and the blueprint of a cultural revolution. The very ambitiousness of the system, however, antagonized as many as it excited to admiration. Academic and scientific officialdom was slow in accepting it, so that by the beginning of 1947 only a few colleges and universities in the United States (University of Iowa, Iowa City, Ia., Northwestern university, Evanston, Ill., Illinois Institute of Technology, Chicago, Ill., University of Denver, Colo., University of Michigan, Ann Arbor, Mich.) were offering courses of instruction in the subject.

The spread of general semantics was in considerable measure due to Korzybski's own efforts. In 1935, the first Congress of General Semantics was held in Ellensburg, Washington, at the Central Washington College of Education. In 1938, Korzybski founded in Chicago the Institute of General Semantics, where he began to give annually three or four seminars—intensive courses of instruction often lasting two or three weeks—which were attended by scientists, physicians, educators, business men and many others. In 1941, the second Congress of General Semantics

was held at the University of Denver and attracted considerable attention. Some 150 to 200 persons were trained at the institute each year, and in 1947 the seminars were being continued in the institute's new location at Lakeville, Conn.

Especially after the foundation of the institute, students of Korzybski's seminars began to make his influence telt in many fields of activity. In education the small number of courses offered in general semantics gave little indication of the extent of its influence, since courses in many branches of instruction were modified or radically changed in the light of Korzybski's doctrines. Some journalists, publicists and radio commentators showed considerable semantic influence in their utterances, while a number of business executives introduced changes into such areas as accounting, personnel policies and intercompany communication systems as a result of the study of general semantics. Korzybski also attracted the attention of writers with a bent for popular presentation who spread the news of the doctrine far beyond the extent to which new theoretical systems are usually publicized. Besides Stuart Chase's The Tyranny of Words (1938), S. I. Hayakawa's Language in Action (1941; a Book-of-the-Month club selection), Irving Lee's Language Habits in Human Affairs (1941) and Wendell Johnson's People in Quandaries (1946) had a wide popular sale, stimulating much general interest in the subject.

In 1942, interested individuals organized the Society for General Semantics and in the following year began the publication of a quarterly, ETC.: A Review of General Semantics, edited by S. I. Hayakawa. At the end of 1946; chapters of the society had been formed in New York, Chicago, Boston, Pasadena, Los Angeles, Iowa City, St. Paul, Milwaukee, Winnipeg (Canada), and Sydney (Australia), each of them devoted either to general discussion and instruction or to the study of special applications of the theories.

At the close of the decade the cultural revolution outlined by general semantics still remained far off. Nevertheless, the depth of conviction exhibited by proponents of the system appeared to indicate that the movement would continue to grow, challenging outworn practices and creeds.

The translation of the theories of general semantics into actual daily practice remained to be accomplished in many fields. Under Professor Wendell Johnson the activities of the Psychological and Speech clinic of the University of Iowa were profoundly reshaped by general semantics theory. Instruction in English, speech and education was influenced by changes introduced into existing practices by such teachers as Professors Irving Lee (Northwestern), Thomas C. Pollock (New York university, N.Y.), Elwood Murray (Denver), Hayakawa (Illinois Institute of Technology), and O. R. Bontrager (State college, California, Pa.). In psychotherapy and the prevention of mental illnesses, new applications of general semantics were devised by Drs. Douglas G. Campbell, C. B. Congdon, Douglas M. Kelley, Alfred Bay and others, but accounts of these had not appeared widely as yet in the scientific press. The usefulness and validity of Korzybski's general theories remained to be demonstrated so far as most fields of special endeavour were concerned. Also, institutional changes in education or in industry needed to be devised which would enable the observation of the effects of non-Aristotelian training applied on a wide scale. (See also PHILOSOPHY.)

Serrano y Suñer, Ramón

Serrano y Suñer (1901-), Spanish statesman, was born in Zaragoza (Saragossa), Spain. He studied law at the University of Bologna in Italy and on his return to Spain took up practice in his native city. In 1923, he became a member of the cortes as deputy of the Catholic party and during the Spanish Civil War (1936-39), he was minister for press and propaganda in the insurgent cabinet headed by his brother-in-law, Gen. Francisco Franco. On good terms with Hitler, Ribbentrop, Mussolini and Ciano, Serrano y Suñer exploited these contacts to obtain more war materials for Franco's armies. He became interior minister and was named foreign minister on Oct. 18, 1940. At the start of World War II, he linked his country closely with axis policies in Europe. However, dependence on Britain for food prevented Spain from effecting a complete rupture with the Allies.

Although Serrano was vocally sympathetic with the aims of Hitler and Mussolini, politically he seemed to doubt the advisability of permitting Germany to extend its influence to Gibraltar and North Africa.

On Sept. 3, 1942, Franco reshuffled his cabinet, ousting his brother-in-law as foreign minister and forcing him to relinquish his post as head of the Falange's political council. However, Serrano continued to exert considerable influence within the Spanish fascist party and as late as 1944, he was said to be one of Franco's inner circle of confidantes and advisers.

Seventh-day Adventists

On Sept. 30, 1936, Seventh-Day Adventist membership in the United States and Canada was 162,735; in 1946, it

was 218,160. World membership in 1936, 429,833; in 1946, 583,923. Total receipts in United States and Canada for the year ending Sept. 30, 1936, were \$6,878,031, or \$42.27 per capita; for 1946, receipts were \$27,036,001, or \$123.92 per capita. Parochial school enrolment, grades 1 to 16, in the United States and Canada during 1936 was 26,362; in 1946, it was 39,999. During the decade a Spanish seminary was opened in New Mexico, and permanent quarters for an English Theological seminary were erected in Washington, D.C. Sales of denominational literature in the United States and Canada for 1936 were in excess of \$1,900,000; tor 1946, \$6,600,000. World sales for 1936 were \$3,600,000; for 1946, \$8,400,000. The denomination's total investment in 1936 was in excess of \$57,000,000; in 1946, \$118,000,000. In the decade ending Dec. 31, 1945, 1,174 missionaries were sent out.

On Jan. 4, 1942, a radio program, "The Voice of Prophecy," was put on a nationwide hook-up in the United States through 85 stations. By 1946, a total of 400 stations carried the program; in addition, an overseas program was carried on 139 stations.

About 12,000 of the denomination's youth in the United States were trained in medical noncombatant service in parochial schools, ready to enter the army at the outbreak of war. One noncombatant Adventist youth, Cpl. Desmond T. Doss, was decorated with the Congressional medal of honour.

A \$5,000,000 fund was created for rehabilitation of overseas work. About 750 tons of clothing were sent to warstricken countries.

In 1944 a plan was approved for separate conferences in the United States for the Negro constituency. A hospital for Negro patients and for nurses' training was established in Nashville, Tenn.

At the annual Autumn council, held in Grand Rapids, Mich., in Oct. 1946, a budget in excess of \$13,000,000, was voted for 1947. This was largely for overseas work and was the largest annual budget ever set up. (F. D. N.)

Seyss-Inquart, Arthur

Seyss-Inquart (1892–1946), Austrian politician, was born July 22, 1892, in Stannern, in the Sudeten district of Czechoslovakia. While studying law in Vienna in 1908, he established his permanent residence in the Austrian capital. He was graduated from the University of Vienna and practised law in that city. During World War I he served in the Austro-Hungarian army for three years and in 1928 he joined the Austrian nazi party, becoming one of its leaders.

When Chancellor Kurt von Schuschnigg reorganized the Austrian cabinet Feb. 15, 1938, at Adolf Hitler's command, he appointed Seyss-Inquart minister of the interior and security. After Schuschnigg's resignation on March 12, 1938, Seyss-Inquart became chancellor and urged the earliest possible dispatch of German troops to Austria to "restore order." Two days after the formal proclamation of anschluss, Seyss-Inquart was appointed statthalter (governor) of Austria. The following month, he relinquished

neal authority (although he remained statthalter) to Joseph Buerckel, who became commissioner of Ostmark (as Austria was known under the nazi regime).

In May 1940 Seyss-Inquart was made German high commissioner for the conquered Netherlands. In this capacity he employed ruthless measures to stamp out all opposition to the German occupation. He fled from the Netherlands after its liberation and was taken prisoner in Germany on May 8, 1945. Seyss-Inquart, along with other top nazi leaders, was indicted Aug. 29, 1945, on charges of war crimes before the International War Crimes tribunal at Nuernberg. Found guilty of crimes against the peace, war crimes and crimes against humanity, he was sentenced to death on the gallows Oct. 1, 1946, and was executed Oct. 16, 1946.

Sforza, Carlo

Count Sforza (1873—), Italian statesman, was born at Montignoso di Lunigiana. After entering the diplomatic service, he was minister at Peiping (1911) and at Belgrade (1916). Two years later, he became Italian high commissioner in Turkey. Created senator in 1919, he served as foreign minister (June 1920-July 1921). Appointed ambassador in Paris in Feb. 1922, he resigned after Benito Mussolini's accession to power, becoming a leader of the anti-Fascist opposition in the senate. After the murder of Giacomo Matteoti in 1924, Count Storza left Italy and went into self-imposed exile. He returned in Oct. 1943 after Mussolini's downfall; on his arrival he refused to support the Pietro Badoglio regime and charged that the house of Savoy had become an "obnoxious" symbol of fascism through its close association with Mussolini.

The fall of the first Ivanoe Bonomi cabinet, Nov. 26, 1944, put Slorza in the forefront as a possible candidate for premier. Anthony Eden, then Britain's foreign secretary, ruled against Slorza, however, and charged that he had worked against the Bonomi government. Winston Churchill offered the further explanation that Slorza was "untrustworthy" and had conspired to overthrow the Badoglio regime in violation of a pledge made to the Allies. Slorza denied these charges of intriguing, but British pressure prevailed in the dispute. Slorza subsequently declined Bonomi's offer of an ambassadorship to the United States. In 1945 Slorza was appointed president of the Italian consultative assembly.

Shaposhnikov, Boris Mikhailovich

Shaposhnikov (1882-1945), Russian army officer, was born Oct. 4, 1882, in Zlatoust, Russia. At 19 he entered the Moscow Military school and after completing his studies went into active service. He was graduated from the Academy of the General Staff in 1910, was commissioned an officer in the tsarist army, and was aide to Grand Duke Nicholas on the general staff during World War I. In May 1918, his offer to serve the Red army was accepted; he was appointed an assistant commissar by Nicolai Lenin and Leon Trotsky, and in 1930 he joined the Communist party. He was chief of the general staff, 1929-31, and was again appointed to that position in 1937 when he also became a member of the central executive committee of the U.S.S.R. For his achievements in the Finnish campaign, 1939-40, he was promoted to the rank of marshal in May 1940. In the summer of that

year, he resigned from the general staff because of ill health, but was recalled Oct. 31, 1941, when the Germans were nearing Moscow. Under his direction, the Red army traded space for time, and curtailed the power of the blitzkrieg technique with a defense-in-depth strategy. His planning enabled the soviets to repulse the German army at Stalingrad in 1942. Recognition of his achievements was evidenced by a nation-wide observance of his 60th birthday. As chief of the Frunze Red Banner Mılitary academy, 1932-35, Shaposhnikov trained many of the outstanding Red army commanders and helped lay the groundwork for the creation of a modern army. He was vice-commissar for national defense, 1941, Stalin's personal military adviser and deputy of the supreme soviet of the U.S.S.R. In April 1943, it was announced that owing to protracted illness, Shaposhnikov had been replaced as chief of staff by Marshal A. M. Vasilevsky. His publications included The Cavalry (1923), On the Vistula (1924) and The Brain of the Army, 3 vols. (1927-29). He died March 26, 1945.

Sheep

The number of sheep and lambs on United States farms had declined in 1937 to 51,019,000 head; thereafter an increase started which continued until a record peak of 56,735,000 was reached in 1942. Another decline then set in, and by 1946 the Jan. 1 estimate was down to 44,241,000 head. The 1945 lamb crop was estimated at 28,500,000 head, compared with a ten-year (1934-43) average of 30,589,000. The number of lambs on feed remained fairly constant-5,597,000 head in 1937 and 6,630,000 in 1945. By 1942 the demand for U.S. meat was reflected in the increasing number of sheep and lambs; the total of these animals on farms and produced during the year rose to about 88,000,000 head. This brought the sheep industry to a high level that could not be continued with the strong competition for feed. By 1943 the number of stock sheep had declined; the lamb crop was estimated at 31,-100,000, or 1,500,000 fewer head than in 1942 and the lowest after 1939. Again in 1944 the Jan. 1 estimates showed a decline, about 7%, and the lamb crop was only 29,600,000 head, a loss of 5%. The principal cause of the decline was the acute labour shortage in the range and livestock feeding regions; prices had not declined. In 1945 another drop was recorded and by Jan. 1, 1946, sheep numbers were down to a new low point for two decades.

Number of Sheep in United States, 1937–46 (On Jan. 1)

										51,019,000	1942.					56,735,000
										51,210,000	1943 .					55,775,000
										51,595,000						51,769,000
										52,399,000						47,780,000
1941	•	٠	٠	٠	•	•	•	٠	•	54,283,000						44,241,000

Prices of sheep and lambs began a sharp increase in 1941 which continued through 1946. The average May price of sheep at Chicago was \$4.10 per 100 lb. in 1937 and advanced to \$6.93 in 1943; lambs were selling at \$10.69 per 100 lb. in 1937 and advanced to a top of \$14.46 in 1942. These prices in 1942–43 were not sufficient to maintain production in the face of the labour shortage and higher wages. Subsidies were paid to slaughterers from 1943 to 1945, when a direct payment to producers was begun and continued into 1946. These payments varied from \$1.50 to \$3.15 per 100 lb. on different weights

A newborn black lamb being tagged at a stock farm near Los Angeles, Calif., in 1945. The farm sold breeding ewes and raised sheep for Persian lamb, Karakul and broadtail skins

of lambs at different seasons. The announced purpose was to prevent increases in the price of the meat to consumers. The plan did not operate to increase production, which continued to decline.

The fall in sheep values began in 1943, when the price of pelts was no longer fixed by the government. Large stocks of wool had a depressing effect on the sheep market. The great war need had begun to pass, and mill consumption declined because of labour shortage. Since wool prices were particularly subject to the effects of government action, sheep raisers were not inclined to expand nor even to maintain production in the face of uncertainties. Wool production increased from about 423,000,000 lb. in 1937, when the average price was 32 cents per pound, to 459,000,000 lb. in 1942 and then declined to about 400,000,000 lb. in 1946, although the price was 42.4 cents per pound. Large amounts of wool were imported duty free in 1942-44 and stored for other governments. This wool was not to be used by U.S. mills, and much of it had been exported by Jan. 1946. The United States had been on a wool-importing basis for many years for domestic use.

The U.S. sheep industry suffered in comparison with other farm enterprises because of the shortage of skilled labour. This need could be replaced only slowly, as competent herdsmen could not be trained quickly. Sheep numbers were low in the range states, and the unsettled wool market was not encouraging to ranchmen. The per capita consumption of lamb and mutton averaged 6.7 lb. in 1935-39 and rose to a high point of 7.2 lb. in 1945, when the shortage of meats for civilian use was most acute. Shidehara, Kijuro

Baron Shidehara (1872—), Japanese statesman and diplomat, graduated from the Imperial university, Tokyo, in 1895 and entered the diplomatic service the following year. He was appointed Japanese minister to the Netherlands in 1914 and vice-minister of foreign affairs in 1915. As Japanese ambassador to Washington he attended the Washington conference (1921–22). Created a baron in 1920, he was loreign minister from 1924 to 1927 and from 1929 to 1931. On his resignation in 1931, in protest against Japanese seizure of Manchuria, he earned a reputation as a "liberal."

Shidehara lived in relative seclusion until the fall of the first postwar cabinet of Prince Naruhiko Higashi-Kuni, after which he formed the new government, on Oct. 6. 1945. The baron-premier promised establishment of a "liberal" regime, but did not state whether his government would include all the leftist parties. He advocated caution in abolition of Shinto as the state religion, defended the authority of the emperor and reluctantly complied with directives from Gen. Douglas MacArthur to allow Japanese women to vote, encourage labour unions, liberalize education methods and democratize Japanese economic institutions. He reorganized his cabinet, Jan. 12, 1946, for the fourth time since its inception in order to eliminate five ministers mentioned in Gen. MacArthur's "purge" directive. The Shidehara cabinet resigned (April 22, 1946) after the first postwar elections. He was named vice-premier in the cabinet formed by his successor, Shigeru Yoshida, May 22.

Called on to testify at the Tokyo trial of high Japanese charged with war crimes, he admitted June 26, 1946, advance knowledge of Japanese plans to invade Manchuria

Shigemitsu, Mamoru

Shigemitsu (1887—), Japanese statesman and diplomat, was born July 29, 1887, in Oita-ken. Educated at the Tokyo Imperial university, where he received his law degree, he entered the foreign service in 1911 and held minor diplomatic posts in Europe and the U.S., 1911–18. Struck by fragments of a bomb hurled at him by a Korean patriot at Shanghai in 1932, he lost a leg. He was made vice-minister of foreign affairs, 1933, ambassador to the soviet union, 1936, and ambassador to England, 1938.

Tokyo ordered Shigemitsu in 1941 to leave his British post and return home; while en route to Japan, he paid a courtesy visit to Washington. On Dec. 9, 1941, two days after Japan's attack on Pearl Harbor, Shigemitsu was appointed ambassador to the Chinese puppet regime at Nanking. In April 1943 Premier Hideki Tojo reshuffled his cabinet and named Shigemitsu foreign minister. Betore the Pearl Harbor attack Shigemitsu was reported to favour Japanese co-operation with Great Britain and the United States; he was said to be highly critical of the ruling Japanese military clique. He was retained as foreign minister in the Koiso cabinet but was not in the succeeding Suzuki regime.

After Prince Higashi-Kuni formed the first postwar cabinet of defeated Japan (Aug. 16, 1945) Shigemitsu was returned to his old post as foreign minister. In his first statement, Aug. 18, he advised his countrymen to admit their defeat and said Japan must win the world's sym-

pathy and understanding. He signed the Japanese surrender document aboard the U.S. battleship "Missouri," Sept. 2. Two weeks later (Sept. 17), he was dismissed as foreign minister. Shigemitsu was one of the 28 Japanese defendants who appeared before the Allied tribunal in Tokyo (the sessions started Apr. 29, 1946). He was indicted on 55 counts, including crimes against the peace, war crimes and crimes against humanity.

Shimada, Shigetaro

Shimada (1883-), Japanese naval officer, was born in Tokyo. In World War I, he was Tokyo's military attaché to Italy and later held many administrative and command posts. He was vice-admiral and commander in chief of Japan's 2d fleet, 1937. In 1941 he was successively commander in chief of the Japanese fleet in China waters, commandant of the Yokosuka naval station and navy minister in the Tojo cabinet formed in Oct. 1941. After the U.S. landings in the Marshall Islands and the blistering air attack against Truk Island in Feb. 1944 he relieved Fleet Admiral Osami Nagano as navy chief of staff and assumed this additional post himself. As Japan was defeated in successive naval engagements through 1944, Shimada was ousted as navy minister, July 17, 1944, and as naval chief of staff, Aug. 2, 1944. His retirement "at his own request" was announced Jan. 20, 1945.

Shimada was one of the 28 Japanese leaders brought to trial (Apr. 29, 1946), before an Allied tribunal in Tokyo, and was indicted on 55 counts which included crimes against the peace, "conventional war crimes" and crimes against humanity.

Shinwell, Emanuel

Shinwell (1884–), British cabinet member and politician, was born Oct. 18, 1884, in London. A high-ranking member of the Labour party, he was a member of the house of commons from 1922 to 1927 and from 1928 to 1931, and was 1e-elected in 1935. He was financial secretary in the war office (1929) and secretary for mines (1924 and 1930–31).

A caustic-tongued debater, Shinwell's exchanges with the Churchill government leaders enlivened discussions in commons. During World War II he criticized the Churchill government for the failure of British arms in the Malaya, Hong Kong and Libya campaigns. As he did not spare members of his own party, the Labour party executive board in late 1942 was pondering disciplinary measures to curb his acidulous attacks. An avowed leftwinger, Shinwell surprised his supporters in Dec. 1942 with a spirited defense of the criticized Darlan agreements; he stated that if the Allies could conquer North Africa with Darlan's aid the agreements were justified.

After the Labour party took over the government in the summer of 1945 Prime Minister Attlee appointed Shinwell to the post of minister of fuel and power. An advocate of nationalization of the coal mines, he intro duced in commons (Dec. 19,1945) a bill to "establish public ownership and control of the coal mining industry and certain allied activities." The Coal Nationalization bill, passed by the house of commons, Jan. 30, 1946, established a nine-man board for control of the coal industry and made the board responsible to Shinwell.

Shipbuilding

The decade 1937-46 was epochal in the history of the shipbuilding and ship repairing industry, not only in

the United States but in the world. Never before had the industry achieved a performance record even approaching that attained in the building of both merchant and naval vessels in the United States during World War II. Employment in the industry in 1943, at its peak in that year, was some 18 times as great as at the beginning of the ten-year period.

Employment of personnel in the U.S. industry in 1937 was approximately 100,000, of which two-thirds was in the privately operated yards and one-third in government-operated naval shipyards. Taking into account the employment in the allied industries, therefore, the total employment provided by the industry was approximately 200,000 at the beginning of the decade.

In 1938, employment was slightly less than that of 1937 At about the time of the outbreak of war in Europe in 1939, however, employment had begun to increase, and continued upward until it reached a maximum of 1,722,500 at the end of 1943. Of this peak number, 1,396,400 were employed in the privately operated shipyards and 326,100 in government naval shipyards. Of those engaged in the private industry at that time, about 10% were engaged on ship repairing. As between naval and merchant work, the privately operated yard forces were about equally divided in the war period.

From the beginning of 1944 to the end of 1946, employment gradually decreased, although it remained more than 1,000,000 until the surrender of Japan in 1945. After that time the liquidation of employment was heavy, and at the end of 1946 was about 110,000, a figure which nevertheless was substantially more than the figure which prevailed in the immediate prewar years.

Geographical Shifts in the U.S. Industry.—During the peacetime years immediately preceding the beginning of the European war in Sept. 1939, there were only 22 privately owned U.S. shipyards engaged in the building of large naval and seagoing commercial vessels. The larger part of this work was performed on the east coast of the United States. There were, however, many smaller yards engaged in the building of barges, towboats, carfloats, ferries and miscellaneous small craft for both commercial and government use, and some 15 or more inoperative shipyards with facilities that would have enabled them to build seagoing commercial vessels, if the volume of work had been sufficient to necessitate their use. These smaller yards were well distributed over all the coastal areas, on the Great Lakes and along the great rivers.

During the first part of the war period, all of the coastal areas, at first, and later all areas, which included the Great Lakes and the rivers, contributed considerably to the building of both merchant and naval craft, although seagoing naval and commercial vessels of the larger sizes were built in the coastal yards.

Prior to the war, construction on the Great Lakes had been confined largely to vessels for lake service, as the canal locks and depth of water channels limited the size of vessels built there capable of navigating to the seas. During the war, however, after changes had been made in bridges in the Chicago area, commercial vessels up to 321 ft. in length and submarines of 307 ft. in length, assembled in large part on the Great Lakes, reached the sea via the Chicago Drainage canal and the Illinois and the Mississippi rivers.

Prewar Û.S. Construction.—Naval contracts in private yards had brought about substantial activity in shipbuilding at the beginning of the decade 1937–46. Work for the

yards was turther increased by a \$50,000,000 appropriation for auxiliary naval vessels in 1937. Another act of congress, in 1938, authorized an increase in naval building beyond the strength permitted by the Washington and London naval treaties, and permitted the number of and tonnage restrictions on combatant vessels to be expanded approximately 23%.

All of these naval increases antedated the outbreak of the war in Europe in 1939.

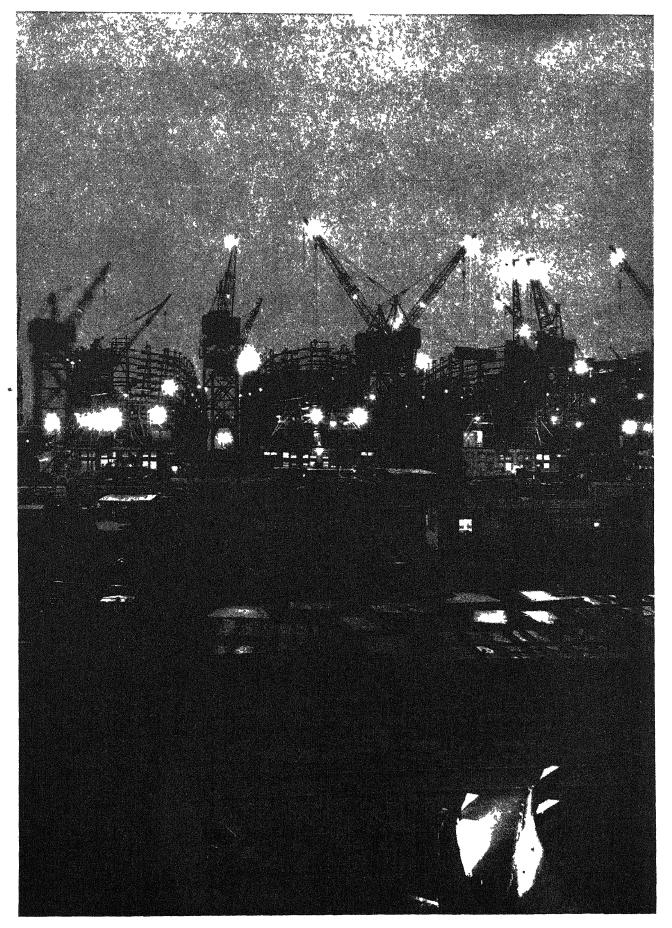

In 1940, two acts of congress greatly increased the then authorized strength of the U.S. navy. The first act, sometimes referred to as the "Eleven Per Cent Increase," was passed on June 14, 1940. The second, passed on July 19 1940, increased the existing authorized strength of the U.S. navy by approximately 70% in the combatant categories. It was commonly referred to as the "Two-Ocean Navy Program." This act also authorized the building of 100,000 tons of auxiliary vessels and an expenditure of \$50,000,000 tons of auxiliary vessels and miscellaneous craft. In May 1941 congress authorized the construction of 550,000 tons of auxiliary vessels in addition to those heretofore authorized and in Nov. 1941 authorized the construction of 400 smaller vessels for local defense.

All of these authorizations or appropriations were made before the United States declared war in Dec. 1941.

Wartime Naval Construction.—Acts later in 1941, shortly after Pearl Harbor, provided for a still further increase of 150,000 tons in combatant vessels to make good the losses of battleship strength which at that time were thought to have been permanently incurred in the Pearl Harbor attack, plus the construction or acquisition of 800,000 tons of auxiliary vessels and an additional 400 smaller vessels for harbour defense purposes. This was followed in rapid succession by the enactment of the socalled "Emergency Construction Program" for 1,799 minor combatant, auxiliary and patrol vessels of various types, the Submarine act, authorizing the construction of 200,000 tons of combatant ships and finally the act of July 9. 1942, providing for the construction of an additional 1,900,000 tons of combatant ships. This last authorization, which was greater than the total tonnage provided by the preceding authorizations, resulted in expanding the original "Two Ocean Navy Program" into a "Five Ocean Navy Program."

Private shipbuilding yards delivered 1,027 combatant vessels of 2,538,065 displacement tons of the following types: battleships, aircraft carriers, cruisers, destroyers, destroyer escorts, high speed transports (destroyer escort type), frigates, minelayers (destroyer type), gunboats and submarines in the years 1941-45. The government-owned and -operated naval shipbuilding yards delivered 325 combatant vessels of similar types of 962,975 displacement tons or a grand total of 1,352 combatant vessels of 3,501,040 displacement tons. Private yards also delivered 166 auxiliary naval vessels of 1,061,959 displacement tons of the following types: seaplane tenders, destroyer tenders, motor torpedo boat tenders, repair ships, aircraft carrier escorts, submarine tenders, submarine rescue vessels, mine layers, ammunition ships, oilers, fuel oil ships, store ships, transports and landing ship vehicle (formerly large net lavers), in the years 1941-45. Government-owned and -operated naval shipbuilding yards produced 13 auxiliary vessels of similar types of 69,310 displacement tons or a grand total of 179 auxiliary vessels of 1,131,269 displacement tons.

Other naval vessels of miscellaneous types were constructed during the years 1943, 1944 and 1945 as follows:

Many boys under draft age worked full-time schedules at standard wages in U.S. shipyards during the peak periods of war production

patrol and mine craft, 1,984 units of 538,772 displacement tons; landing craft, 73,787 units of 2,815,577 tons, and district craft, 1,895 units of 589,527 tons. The privately owned shipyards of the United States constructed more than 90% of the vessels of these smaller types.

Tables I and II show the major categories of naval vessels built in private shipyards and government naval building yards during the ten-year period 1937–46.

In addition to the building of naval vessels the private ship repair yards participated extensively in the repair and reconversion of various types of naval vessels throughout World War II.

Merchant Shipbuilding.—The program of U.S. merchant vessel construction under way in the early years of the decade was prompted by the merchant marine act of 1936. The Maritime commission, an agency created by this act, was directed to make a survey of U.S. shipping to determine what additions and replacements were required to carry forward a national policy, declared in the act, of providing and maintaining an adequate U.S. merchant marine. It further was directed to study, perfect and adopt a long-range program for replacements and additions that would insure a well-balanced merchant fleet, including vessels of all types, and to provide shipping service on all routes essential for maintaining the free flow of the foreign commerce of the United States.

Under the mandate of this act, the Maritime commission studied and later developed a ten-year plan for the building of 50 seagoing vessels a year. Contracts for the first group of 50 ships were placed in 1938.

When war broke out in Europe in 1939, the schedule of 50 merchant ships a year was doubled. In 1940 it again was doubled, thus providing for the building of 200 high-grade vessels available for either war or peacetime service. Late in 1940, two contracts were placed by the British for the construction of 60 standard cargo vessels, half to be built on the Atlantic coast and half on the Pacific coast.

Early in 1941, these British contracts were followed with the first emergency Liberty fleet program for 200 cargo ships for the Maritime commission account, followed a little later by a lend-lease program of 227 vessels, some of the emergency Liberty and some of standard C types. Then came the first national defense program of 541 ships of both emergency Liberties and standard C types. All of this commercial work had been awarded, and much of it was actually under construction, when the United States entered the war in Dec. 1941.

Great activity in the industry developed from the various actions taken by congress and formalized by the navy and by the Maritime commission. A large staff of technicians was built up in the shipbuilding industry, and at the outbreak of war in the Pacific they were engaged actively in the design of both naval and merchant vessels. The working forces in the shipyards and in the allied marine industries likewise were built up to a degree that placed the industry in a particularly advantageous position to perform the constantly increasing task placed upon it throughout the subsequent war years.

After the U.S. declaration of war, the volume of work for the Maritime commission, the navy and other government departments progressively increased to meet losses and the needs of the armed forces.

In 1937, the facilities in the shipbuilding and ship repairing industry were adequate to handle any probable normal peacetime demands for the building and repairing of either commercial or government vessels. Prior to the war, substantially all building of seagoing vessels was confined to coastal areas.

In 1938, two yards that had been engaged only in repair work since World War I entered the shipbuilding field, one on the west coast and one on the Gulf. In 1939, six additional yards entered the building field, two of which

had been previously engaged in repair work only. Three of these yards were located on the Pacific coast, two on the Gulf and one on the east coast. All of these shipyards began building merchant vessels under contracts placed by the Maritime commission in those two years. These added facilities went into operation before Sept. 1939.

As the European war progressed and the demand for ships increased greatly, additions were made in both structures and equipment in existing U.S. building and repair yards. The first two newly built shipyards for building merchant vessels on a quantity basis were those for the construction of vessels for the British account, previously mentioned; they were started in 1940.

The first new government-owned shipyards for the building of Liberty vessels were started early in 1941 and were in full operation at the time the United States entered the war the following December. Two Liberty vessels, the 'Patrick Henry' on the east coast and the "Star of Oregon" on the west coast, were delivered from these yards at the close of the year.

More and more facilities, both for naval and commercial types of vessels, were added through 1942 and 1943 to meet the ever-increasing demand for ships and more ships. To the extent practicable, the new shipyards were developed under the control and management of existing shipbuilding organizations. In planning shipyard lay-outs, the experience gained in the construction programs of World War I, as well as that of the few years preceding World War II, were utilized. Advantage was taken of the latest advancements in manufacturing and construction methods in other fields. As experience in the operation of the first new yards was gained, still other lessons were learned that were utilized in later shipyard layouts, making possible more production and shorter times for ship deliveries.

New shipyards were laid out on quantity production principles with a view to turning out the maximum number of ships of identical design. Not more than one or two types at a time were built in any new yard. These new plants first were distributed over the particular coastal areas where the greatest reservoir of labour was believed to be available. Later on, as demands became more pressing, the Great Lakes and the great rivers were brought extensively into the building project.

The original schedule of these newer yards for the building program of Liberty ships was formulated on a basis of 180 days from keel-laying to delivery. This plan governed the number of building ways within each yard. Later on, this plan was stepped up to 105 days from keel-laying to delivery. Eventually, at the peak of production, Liberty ships were delivered in less than 40 days average time by the several yards engaged in the building of vessels of that type.

The aggregate tonnage of seagoing merchant vessels of 2,000 gross tons and over produced in the United States in the war years 1941 to 1945, inclusive, was about 37,710,000 gross tons. Of this total, 12,499,873 gross tonnage was constructed in the single year of 1943. The production of combatant naval vessels and large size naval auxiliaries for the same years was approximately 4,632,309 displacement tons, of which 3,501,040 displacement tons were represented by vessels in the combatant category.

Table III shows by types and number of vessels the total gross tonnage of commercial vessels constructed in the United States during the ten-year period 1937–46.

New Production Methods.—Much experience had been gained prior to World War II in the use of welding on both naval and commercial work, in the lay-out of the new shipyards and expansion of older yards and in the design of ships to be built in them. Welding became an important factor; it was particularly suitable where a large number of ships was produced from one design.

Provision was made in new shipyard lay-outs for the subassembly of large sections of the hull structure. This necessitated plenty of space for pre-assembly platens and for the convenient storage of assembly units as needed; but with ample land available at the new sites, this did not present a serious problem. The subassemblies required a supply of cranes of large lifting capacity for transporting heavy assembly units from the ground to the building slip or to storage spaces.

The advantages of subassembly had been well recognized for many years in the old-time shipyards, but its extent had been limited by crane lifting capacity. In at least one of the older yards, subassemblies up to 100 tons had been handled for years. The advantages of subassembly were so great that the new shipyards were fitted with cranes of large lifting capacity-the earlier ones with cranes of 25 to 30 tons capacity and the later ones with 40 to 50 tons capacity and some with cranes of 100 tons capacity or greater. These cranes handled completely assembled and equipped "deck houses" and "pilot houses." Ground space in most shipyards was hard-surfaced, in order to provide for rapid transportation of small parts to assembly and storage spaces by means of trucks, electric cranes and other units. Rails likewise were used for this purpose.

Work was farmed out wherever practicable to large numbers of small enterprises, many of which previously had not been associated in any way with the marine industry. No less than 5,000 plants, large and small, situated throughout the entire country and employing hundreds of thousands of workers, were called upon to produce materials and equipment and to deliver them to the shipyards on time schedules and in the order and the quantities necessary to make possible a continuous, orderly program of building. Shipbuilding hence became an inland as well as a waterfront industry, and the shipyards for the construction of vessels of duplicate types were for the most part assembly plants.

Standardization was exemplified in the Liberty ship as well as in the naval destroyer escorts and some other types. Not only was the basic design standardized but component parts manufactured in different plants were interchangeable. The Liberty ships were built in 17 different private shipyards and the destroyer escorts in 11 private yards and 6 government navy yards.

Within the shipyards, the greatest factor in meeting delivery schedules was repetitive work. It was the first time in the history of shipbuilding that the real effects of multiple production had been achieved. This was demonstrated in the reduced time of construction as the number of ships of a duplicate type increased, and in the lesser number of man-hours required as the number of ships laid down increased. As previously stated, the average time in the construction of a Liberty ship at the peak of production was as low as 40 days from keel-laying to delivery. The average number of man-hours per ship required after 60 ships of the same type had been built was less than half the working hours required for the building of each ship in the first group of ten. Similar

notable reductions were shown with oil tankers, destroyer escorts and other vessels that were duplicated in considerable numbers.

The average number of man-hours required for the construction of each navy destroyer escort after 69 of these vessels had been built in a private shipyard was less than one-half of the man-hours required for the construction on each of the first 3 vessels.

Subassembling was a very important factor, too, not only in the easier assembly and welding of the structural material itself on the platens away from the building ways, but in the ability to outfit each subsection and complete within the subassembly the work on foundations, piping, electrical and other fixtures. Men carried on their work with less exertion and less interference than if performed on the building ways.

Duplicate construction permitted the use of "mockups" and jigs and fixtures for the production of component parts on a simplified quantity basis. Large sections of hull plating were built up on the ground on "mock-up" forms and were completely welded before being hoisted into place on a ship's side.

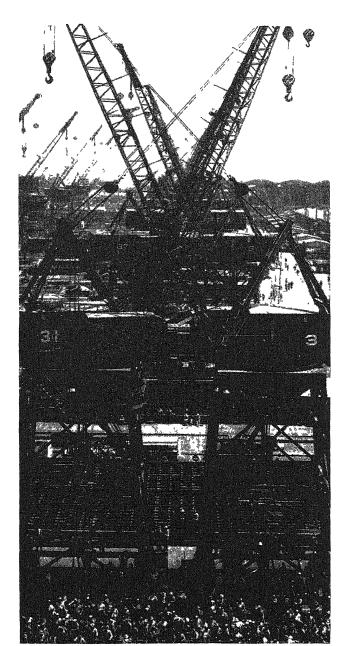

Overcoming the Labour Shortage.—The recruitment of shipbuilding and ship repair workers was a major problem and necessitated speedy accessions from all walks of life. Extensive courses were instituted for training of craftsmen and supervisory employees, and the ability rapidly to expand the working forces and put them on the job was due to the great volume of duplicate work, which made it possible to utilize employees with limited training on tepetitive work.

The basic working schedule in the industry during the war continued to be a 40-hour week, with overtime beyond 8 hours a day or 40 hours in 5 days. Much of the work was carried on during the greater part of the program on an around-the-clock basis; that is, with continuous operation of equipment, but with few employees working more than six days a week continuously except in emergencies. Average hourly earnings in the industry increased from 84.6 cents at the beginning of 1940 to \$1.306 at the end of 1945, and weekly earnings from \$32.00 a week at the beginning of 1940 to a maximum of \$68.00 a week near the end of the program.

Shipbuilding and ship repair employed few women—less than ½%, mostly in office jobs—prior to Pearl Harbor. All tradition was against hiring women to do such heavy work, but with a dearth of manpower large numbers of women were employed. On new construction work at the wartime peak, approximately 120,000 women were employed in the following trades: blacksmith and forge; electrical (including manufacturing); foundry and pattern; joiner, carpenter and shipwright; machine (including boiler); paint (including manufacturing); pipe and copper; blueprinting; rigger (including labourers and erectors); sail and flag; service and maintenance; sheet metal; shipfitting (including welders, burners, riveters, mould loft, fabricating and drafting); and toolroom.

The greatest number of women was employed in the shipfitting and machine trades groups. Their employment was also greatest where the greatest volume of repetitive work was carried on. About 10% of the working forces were women but the percentage varied widely in the individual yards. Their employment in repair yards was not large.

Problems of Naval Shipbuilding.—The problems in connection with facilities and employment for naval building were similar to those for merchant building. The construction of the largest and most highly specialized types of

Shipyard cranes formed giant "Vs" at the California Shipbuilding Corp. yards in Los Angeles, Calif., as workers dropped their tools after the announcement of Japan's surrender in Aug. 1945

combatant vessels was restricted to the older shipyards that previously had been engaged in this type of work. The old-time private shipyards built battleships, cruisers and the larger aircraft carriers and destroyers, as well as the larger auxiliaries and great numbers of smaller craft.

Submarines were built in three private shipyards and in three government naval shipyards. Two private shipyards that had not engaged in the building of submarines prior to World War II participated in the submarine program, one of these yards under direct contact with and under the guidance of a shipyard that had been engaged in the building of submarines for many years prior to the war.

Some new shipyards were built which, because of their size, were restricted to the building of smaller types of naval vessels, while in the construction of the very smallest types, such as tugs, barges, landing craft and other miscel-

laneous boats, every facility in the country that could be used to advantage was brought into service.

In 1939, there were available in the United States approximately 156 building ways of 200 ft. and more in length suitable for the building of seagoing merchant vessels and the larger size combatant naval vessels and auxiliaries. At the end of the program, there were in existence 84 shipyards of such capacity, with 578 building ways. While building ways in themselves were not necessarily a measure of the capacity of the industry unless other facilities were balanced with them, these figures indicated the large increase in plant capacity necessary to carry on the war program.

More than \$1.000,000,000 was invested in new shipyards and in additional shipbuilding and ship repairing facilities, and approximately another \$500,000,000 in the expansion of facilities in various allied marine industries for the construction of naval and merchant vessels.

Naval vessels are of a much more complicated design than commercial vessels, requiring many more man-hours per ton in their construction. This fact was responsible for the much smaller reported tonnage of naval vessels than of merchant vessels built during the war. If converted to the equivalent of merchant tonnage, the total program of U.S. merchant and naval vessels combined built in the years 1941 to 1945, inclusive, would be equivalent to about 75,000,000 gross tons of the merchant type.

In addition to the merchant and naval program, 13,105 vessels of various types, mostly small, were built for the army. Also a considerable number of vessels of various types were produced for the coast guard.

Ship Repair.—It is difficult to measure the important part played by the ship repairing industry during World War II. as no two repair or conversion jobs were even exactly alike. This segment of the industry, however, was called upon to repair commercial ships in the shortest possible time and to convert certain types of naval vessels to other types best suited for war purposes. Some record although inadequate to measure the real service rendered by these repair yards, was shown in the statement that not less than 67,902 vessels were repaired or converted in the shipyards of the United States in the four years, 1942 to 1945, inclusive.

The ship repair yards which were active throughout the war in the conversion of merchant vessels to wartime use were engaged at the end of the decade in the reconversion of these vessels back to peacetime requirements. While the ship repair yards were extensively engaged in the repair and conversion of various types of naval vessels during the war, their participation in such work in peacetime was not expected to be of large proportions.

Postwar Shipbuilding.—In the merchant field, the U.S. Maritime commission and ship owners in 1946 were contemplating the construction of a few large vessels for several services. There were numerous disturbing elements, however, in this building program. Shipbuilding wages had been increased substantially, as well as the pay of seagoing personnel, the latter being more than double what it was before the war. The higher cost of operation would be a controlling factor in a consideration of new tonnage orders.

Another factor was the unsettled tax problem. Ship operators holding operating-differential contracts with the commission were required by the act of 1936 to deposit in statutory reserve funds their profits above a certain level, to be applied against their subsidy accounts.

Although payment of operating differential subsidies was suspended for the period that the war caused abandonment of regularly scheduled operations on essential routes, operators holding subsidy contracts with the commission continued to deposit into the statutory funds proceeds from the loss or sale of vessels, depreciation funds and profits from operations, in accordance with the act of 1936, or as the Maritime commission specified under its granted powers. Considerable sums had been set aside for this purpose. It was the evident intent of congress that operators should set aside such sums for the building of new vessels. However, certain legal problems had arisen in connection with the status of funds reserved during wartime operation, and a demand was made on the operators by the treasury department to subject some of the earnings set aside in these funds to taxation. This matter was having a serious effect on new construction. (H. G. S.)

Great Britain.—The revival in freights in 1937 brought a rush of business to the shipyards, where prices were already beginning to rise; many orders were placed prematurely in anticipation of further advances. Britain led the world for 1937 with Japan second and Germany third, but only about two-thirds of the available slipways were occupied in December, with approximately 250,000 gross tons more commercial shipping under construction than at the end of 1936. Of that tonnage, 60% was steam-driven, against about 33% of tonnage built in continental yards.

Unemployment figures dropped from 11.6% to 8% during 1937, but many men, although registered as shipbuilders, had really left the industry. In some sections this caused a serious shortage, assisted by the dearth of apprentices. Various claims for improved pay and conditions were presented.

During the depression many firms had kept their experimental and designing staffs busy and they, as well as the national physical laboratory, had carried out a large number of experiments which had striking results on the design of ships ordered when business revived. Most were to increase economy by reducing resistance and weight. The diesel engine slowly gained favour, particularly in the opposed-piston type, which was successfully adopted in more tramps.

In 1937, also, the royal navy started its rearmament program, claiming priority in the facilities suitable for building cruisers, destroyers and other specialist types. The business was valuable but was not an unmixed blessing, for it increased prices in all directions and by almost monopolizing the yards which normally built liners forced a number of companies to send their orders abroad. The new types of smaller warship which could be built in the nonspecialist yards were not ordered until later.

By that time the flow of orders for tramp tonnage had slowed down, for costs were rising rapidly. In Jan. 1938 the price of a cargo ship of simple specification was 50% higher than in the middle of 1936. Many factors contrib-

uted but particularly raw materials, labour and subcontracts, over which the shipbuilders had no control. Price combined with a shortage of shipbuilding steel to send more contracts abroad. As regards passenger ships, 1939 was noteworthy for the launching of the Cunard White Star liner, "Queen Elizabeth" (85,000 tons).

Among the foreign contracts were numerous small motor coasters from Holland, although some of the British yards were gaining a high reputation in that branch. Many coasting and short sea trading companies were not only acquiring motor ships of lighter draught than the old type of steamer but were also replacing their larger steamers by a greater number of small motor vessels in order to maintain more frequent sailings, on some routes daily.

Immediately before the outbreak of World War II there was a spate of orders for cargo tonnage because shipbuilding stood to benefit under the government's scheme for state aid, which provided for building loans. These orders fitted in with the government plans for shipbuilding in the event of war. Control had been proved necessary by World War I to secure the maximum carrying capacity of new ships and to arrange the rival claims of the navy and commercial shipping. The former had priority, so that all shipbuilding resources were placed under a new section of the admiralty, the merchant shipbuilding department, under experienced builders. The admiralty controlled repairs as well as new construction, and its local officers decided whether suggested work was necessary; after the war it gave up absolute control but it retained practical control by a system of permits, without which no contract could be placed. Repeated suggestions were made that a ministry of merchant ship construction should be established, but were turned down because it was felt that interdepartmental rivalry would inevitably ensue. Even when the ministry of production was established in Feb. 1942, the admiralty was left with the sole responsibility for shipbuilding, repairs and equipment, but acting in co-operation. Generally speaking, this arrangement worked very well, particularly when the great U.S. shipbuilding effort altered the situation.

To avoid another mistake of World War I when production was held up to permit the new system of standardized construction to be started and to keep in mind the primary necessity for new ships of the tramp type, the admiralty examined the standardized designs to which a number of yards were already building and, when they were suitable (as they were in most cases), arranged for them to be continued on government account. Such yards already possessed all the necessary data, patterns, etc., and frequently stocks of material which permitted much quicker delivery. Minor alterations were made, measures for defensive armament were provided and the designs were simplified in matters of detail, but that was quickly done. Each ship of special design already under construction was considered on its merits; those nearly completed were finished, and a large proportion of the remainder were taken over by the admiralty and converted to auxiliaries.

All the yards which specialized in naval work, or in the construction of high-class types which made their plant and labour well suited to the building of warships, were largely occupied on men-of-war. Several capital ships already under construction were suspended to make way for more urgently needed types (cruisers, destroyers, submarines, etc.), while the royal dockyards concentrated principally on repairs and reconstruction. New designs were soon necessary, and improved constructional methods were adopted where it was possible to do so without slowing down production; in many yards the repair of air raid

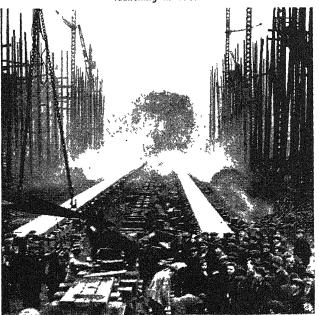

damage gave the opportunity of improving the plant for welding and other methods, and in all cases every opportunity was taken to have component parts made in other plants and assembled in the shipyards.

Under the prewar rearmament program, orders for the smaller types of warship (escort vessels, corvettes, mine-sweepers, trawlers, etc.) were already placed with ordinary commercial yards and, as the war on commerce increased the demand for vessels of those classes, this policy was increased. The necessity for counteracting the magnetic mine led to large numbers of wooden minesweepers being built in old and small yards all round the United Kingdom, as well as in the dominions' yards, which had formerly been used for yachts and fishing craft. The first preparations in 1942 for the invasion of France led to the building of many landing craft; the sections of others were built in various engineering works and assembled in special establishments.

As losses mounted, many designs were submitted to the admiralty to combine the functions of warships and carriers. The merchant aircraft carriers, popularly known as M.A.C. ships, were started in 1942 to carry*aircraft for the defense of convoys and at the same time to transport oil or grain themselves. The first was laid down in Aug. 1942, a 13½-knot motorship of about 8,000 tons, well armed with a flight deck over the hull, hangars and other fittings of the aircraft carrier but still able to carry more than 8,000 tons. Such ships provided protection for convoys without reducing their carrying capacity.

As the war progressed, standardization increased also; more yards were employed on fewer slow tramp types while more ships of higher speed were built for operational purposes. The standardized tramps were mostly about 7,050 tons gross, 10,000 deadweight with simple steam, later frequently diesel, machinery, for 11 knots. Smaller types were of 4,700 tons deadweight. The use of prefabricated sections, but not complete ships, increased steadily. All the tankers in the early part of the war were conservative in design with a maximum speed of 12 knots; 5,000, 12,000 or 14,500 tons, deadweight. For the Normandy invasion, and later for the anticipated Pacific operations in numerous islands, a number of standardized coasters, tugs,

British shipyard workers lowering the plate for a new ship into place before a completed freighter cleared the runways after its launching in 1941

small colliers, etc., were built and, because of the steaming distance in the east, various special types ranging from crane ships to 15-knot cargo liners of about 10,000 tons gross were built with remarkable speed. Frequently the machinery and fittings differed widely, but the hulls were as uniform as possible. Several 15½-knot refrigerated cargo liners, 8,560 tons gross with diesel engines, were also built for the food supply service. Special 15-knot geared turbine tankers of about 8,200 tons gross, 11,900 deadweight, were also built and proved invaluable.

On the question of speed the admiralty was bitterly criticized in press and parliament, even while it was building a number of fast ships for the invasion under cover of censorship. The cost in material and labour of increasing the speed of the tramp-type ships would have been prohibitive and they would have had no opportunity of using it in convoy owing to the standards of most of the escort vessels.

In finish, fittings and accommodation, all these were of "austerity" design to economize in material and labour. It was often acknowledged to have been taken too far, and the regulations were relaxed after experience with the first ships; in some the saving in weight led to serious disadvantages which had to be rectified. Most were delivered by the British yards as soon as they were sufficiently completed to make an outward voyage in reasonable safety; the missing fittings were installed in dominion or Allied ports, particularly those of the United States.

Every attention was paid to the design and, with due care for production difficulties, the greatest pains were taken by tank tests and other means to procure the most satisfactory hull forms for capacity, speed and economy. Some measures taken to simplify construction proved exceedingly efficient at sea. The accommodation, for passengers where it was fitted, and for the crew in all cases, was of the simplest possible description; for the crew it was often far inferior to the standards set by the private shipowners well before the war in size and furnishing. Owners who later bought the ships had to incur considerable expense before officers and men would serve in them.

Bottlenecks and supply difficulties had been considered in the prewar plans and the calculations proved to be remarkably correct. Tankers were such a tempting target and so vulnerable to attack that a serious oil shortage had been anticipated; all the earlier tramp-type ships were therefore built to burn coal. Triple expansion engines were fitted in many types which would normally have been given geared turbines and, in the early days, the supplies of diesel engines were strictly reserved, although later the opposed-piston type was permitted for many ships of low speed. Single screws were ordered wherever possible, even for fast ships. As the situation eased, and improved measures reduced the losses, it was possible to relax the restrictions considerably, and as the navy put the results of all its experiments at the disposal of merchant shipping the later ships were, generally speaking, up-to-date in every respect and with a little adaptation could be made excellent for postwar trading. The earlier types, however, were unattractive to shipowners.

Shipowners always had the right to submit requests for licences to build ships to their own design, subject to admiralty approval. Very few were granted before 1942, but thereafter the number increased steadily, although the designs were frequently greatly modified and the necessity for many of the modifications, nominally to save materials, was questioned.

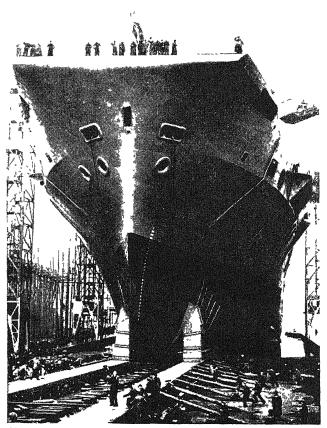

As in World War I, attempts were made to conserve steel by concrete construction, but on a much smaller scale. Few seagoing ships were constructed, although a very large number of lighters for port work were built to replace steel barges requisitioned by the services. The technique was considerably improved and the proportion of steel was reduced, but not nearly to the extent necesany to make concrete a real rival of steel in peacetime. On the other hand, the use of aluminum and other light metal alloys was successfully adopted and saved a great deal of steel, although supplies were very severely rationed because of the priority of the aircraft industry. In the later stages, plastics were also used for nonstrength parts, after they had been greatly improved. The shortage of timber when the northern European sources were cut off led to the development of numerous substitutes after experiments in the national physical laboratory and elsewhere.

Welding also made immense progress although not to the same extent as in the United States, because of the impossibility of holding up production while the new ship-yards necessary for its successful employment on a large scale were built. Nevertheless, its employment where suitable, and for repair work, led to a great saving of weight and man-hours, and unskilled labour could be very much more rapidly trained for it than for riveting. A large number of women were successfully employed. Welding also overcame the serious bottleneck of very large castings for stern frames, etc.

The same necessity for uninterrupted delivery prevented adoption of prefabrication in large ships, as it was in the U.S.A. and Canada, but partial prefabrication for large ships was usefully employed in the fully standardized designs. For the small craft built for the Normandy and Pacific campaigns, complete prefabrication was adopted, most of the assembling being done in special establishments, including reopened yards that had been closed down and cleared of their equipment during the depression. Fabrication within the shipyards, and the assembly of large sections in convenient places away from the slipway made great strides.

As the admiralty always worked on the principle that a ship which was not too badly damaged could be repaired and sent to sea again very much more quickly than a new ship could be built, the repair sections were very busily employed, demanding a fluidity and mobility of labour which was not easily contrived. The repair yards were constantly under air attack and were severely handicapped by the blackout regulations; yet the work done was far beyond expectations. Welding was largely employed, but when the demand for repairs became so great, as much as possible was done in overseas yards, the government paying owners the difference between their prices and the British level. All repairs, both damage and maintenance, were subject to a special licence, and the rules for regular survey were relaxed. Under lend-lease, the U.S. yards carried out a large proportion of this repair work; in the early days their price was much higher, but by 1945 there was little difference in most jobs. The facilities of the royal dockyards were quite insufficient to cover the repairs demanded by the navy, and many warships were serviced in private establishments.

Labour was one of the greatest problems of the industry at the beginning of the war and remained so until the end. In 1939 about 90,000 workers were employed, about 26,000 on merchant ships; owing to the constant demand for warships, the latter figure never averaged more than 35,000,

H.M.S. "Eagle," largest aircraft carrier in the Royal navy at the time of its launching at Belfast by Princess Elizabeth on March 19,

excluding those on repair work. The unions made every reasonable concession with regard to demarcation and the dilution of labour to increase output, with the understanding that their privileges would be restored after the war. Yard committees were set up to settle doubtful points. and although they were occasionally accused of exceeding their functions they worked well and avoided many disputes. Skilled shipbuilders were withdrawn from the territorial army and returned to the trade; genuine craftsmen were exempted from conscription, but its intensification in 1942 increased the shortage of the unskilled labour which was doing excellent work. The Essential Work orders applied to shipyards and directed a number of former shipbuilders, and technicians who were ordinarily employed on housebuilding and similar work, to them. Many of these who had been out of the industry for a long time were found to have lost their skill and nerve when working at a height. Highly skilled and supervising labour remained a great difficulty, particularly on isolated jobs, like repairing ships afloat, which demanded an unusual proportion.

As the shortage increased women were admitted into the yards. On the new construction side they proved themselves able to cover an unexpectedly large range of work and had a smaller percentage of accidents than the men; on the repair side they naturally had less scope, although they undertook the lighter jobs with conspicuous success.

All branches of shipyard labour earned good money during the war; at the end the average for men more than 21 years of age was 145s. 6d. a week, the highest wage in the country except (by a very small margin) the motor vehicle and aircraft industries. With overtime, many earned much

more than that. Most of the labour troubles which occurred were after 1942, when it was found that excessive hours cut down the output and official attempts were made to reduce overtime, including Sunday work. There were comparatively few strikes, practically all unofficial and against the advice of the unions.

As was only to be expected, shipyard prices rose steadily in all branches from the beginning of the war to the end. The admiralty contracts were kept down to a very low level compared with those of owners who ordered ships under licence; when contracts were again placed freely it proved that the price for a simple cargo ship had increased by at least 100%, and in the case of fast, passenger or special-purpose ships by very much more. Repair costs advanced still more; by the beginning of 1944 they were already about 140% more than the prewar level, after which no official figures were published, but the increase was accelerated.

The total mercantile output of the British yards between the outbreak of war and Dec. 1944 was approximately 5,750,000 gross tons in ships of more than 100 tons each. Owing to the more elaborate fittings it was impossible to make an exact comparison with the effort during World War I, but the output per man was estimated as between 50% and 75% greater, a result largely obtained by improved machinery and modernized layout of the yards.

The change-over from war to peace started in 1945, but it had to be achieved gradually. Owing to the important posts in the wartime administration given to men who were connected with shipyard labour, the difficulties were fully understood; shipbuilding was excluded from the government's scheme of nationalization in 1945.

The industry was immediately faced with an immense amount of new construction and overdue repairs, quite apart from the reconditioning of a large number of ships which had been radically changed for their war service. For instance, the final stage of the reconditioning of the "Queen Elizabeth" at Southampton (June–Sept. 1946) was the greatest piece of reassembly ever undertaken and was possible only because the original furniture and fittings, stored in various parts of the world, were intact. Her sister ship the "Queen Mary," holder of the Atlantic blue ribbon since Aug. 1938, was in process of reconditioning at the end of 1946.

Facilities being still limited, all new orders remained subject to admiralty licence, granted according to the national importance of each particular type and the losses which the owners had sustained. This gave precedence to cargo liners, whaling depot ships, fishing vessels and certain other types, while the needs of tramp shipowners, unless they could prove a good case, had to be satisfied by the purchase of government-built ships; passenger liners of normal design had to be reconditioned for further service even if they were over age. The cost of all types was very high, particularly those of which the furnishing, etc., demanded a number of subcontracts; the great majority of outstanding warship contracts were cancelled at the first opportunity, and the firms concerned turned to other branches of shipbuilding whenever possible, otherwise to entirely different industries in which their machinery could be adapted.

British Commonwealth.—The dominions started shipbuilding in 1940 from practically nothing, yet Canada and Australia made a very important contribution to the Allied effort, and others according to their ability and conditions. Canada's output was by far the most important, with yards operating on the Atlantic and Pacific coasts and the Great Lakes. The output of the Pacific yards was the greatest, unhampered as they were by climatic conditions which impeded winter work in the other areas. The majority of the ships turned out were of the North Sands type, similar to the British Empire and U.S. Liberty ships, but later the yards turned to an adaptation of the faster U.S. Victory design and numerous naval auxiliaries. Establishments which could not construct such big ships built vessels of 4,700 tons deadweight, while those from the Great Lakes were of smaller tonnage to pass through the canals.

Starting with only nine big slipways, Canadian yards built 456 merchant ships of a little less than 4,000,000 tons deadweight by April 1945; in 1944 their output equalled that of Britain and 70% came from British Columbia. During the peak period. 75,000 men and women were employed. In addition Canada repaired and refitted a large number of ships and built destroyers, minesweepers, corvettes and other small warships for the royal and Canadian navies

Australian shipbuilding had to face even greater difficulties, depending for its steel almost entirely on the Broken Hill company. It began by concentrating on naval small craft but turned to cargo ships of somewhat similar types to the Canadian. In the latter stages of the war, most of the labour had to be diverted to repairing Allied ships damaged in the Pacific. Its great handicap was high costs; similar ships cost £68 (Australian) per deadweight ton, £45 in the U.S.A., £37 in Canada and £26 in Britain. After the conclusion of the war, great efforts were made both in Australia and Canada to keep the shipbuilding industry alive.

Compared with Australia and Canada, the new construction in South Africa, New Zealand and India was small, largely because of difficulties with material and labour. A certain number of useful small warships and auxiliary craft were built, but the main effort in these countries was in repair work, with which their facilities were fully occupied. (See also Shipping, Merchant Marine.) (F. C. Bo.)

Shipping, Merchant Marine

The United States merchant marine during the decade 1937–46, became the largest merchant fleet ever to sail under one flag. A ten-year plan by which the United States Maritime commission—established by the Merchant Marine act of 1936—hoped to place 500 new oceangoing merchant vessels in service under the U.S. flag was multiplied more than ten times. The stimulus of World War II brought forth a shipbuilding effort in which every known record for speed and quantity of construction was shattered, and at the end of hostilities the U.S. merchant fleet contained three-fifths of all the tonnage afloat in the world.

The story of this accomplishment properly begins with the shipbuilding for the war of 1917–18, for the vessels in the U.S. merchant marine in 1937 were principally those built in the five-year shipbuilding period that began with U.S. entrance into World War I and ended in 1922. Consequently, the U.S. merchant fleet, lacking the addition of a single cargo ship from 1922 to 1936, was in exceeding need of replacements.

On June 29, 1936, President Roosevelt signed the Merchant Marine act. He had recommended to congress that more realistic legislation be enacted than the laws which had failed to give soundness to the merchant fleet. There was considerable apathy and opposition to the bill in congress, and it passed the house of representatives by only eight votes. As it emerged on the statute books, however, it was a sincere attempt to right a number of ills that had

beset the shipping industry for many years. It attempted to be comprehensive in all phases of maritime activities which the government was called on to assist or regulate.

The United States Maritime commission created by the act was to consist of five members, one to be designated as chairman. Broad authority was granted the commission to operate in matters of a commercial nature. A survey of the existing fleet was ordered as the basis for a long-range construction program. The Maritime service was established to provide training for United States citizens as licensed or unlicensed merchant seamen. Finally, the act provided for subsidization, both for construction and operation of ships, by the fairest and most practical plan yet devised.

Joseph P. Kennedy was confirmed by the senate as the commission's first chairman on April 15, 1937. On that same day, Edward C. Moran, Jr., Rear Admiral H. A. Wiley, USN (retired), Thomas M. Woodward and Rear Admiral Emory S. Land, USN (retired) were confirmed as members. The commission immediately began fulfilment of the act's stipulation that an inventory should be taken of U.S. maritime resources. An economic survey of the merchant marine was submitted to the congress on Nov. 10, 1937.

Its revelations were startling and its recommendations frank.

The report made clear many of the weaknesses in U.S. maritime structure. It stated many of the problems that had to be resolved before the U.S. merchant marine would be in a position to accomplish the aims outlined in the declaration of policy. It discussed the various theories of the causes of U.S. maritime degeneration with considerable thoroughness, but the underscoring of shipping in its national defense aspects was significant. It pointed out that in time of war the United States invariably had turned to offense as the best means of defense, and that a corollary of this action was adequate supply for a war at a distance from U.S. shores; that there were 60 or more harbours and 7,000 mi. of coastline to be guarded by the navy; that to transport an army and its equipment overseas would take an amazing number of ships.

Though the report stressed the military value of a strong merchant fleet, the nation was not at war, nor was Europe, in 1937. Consequently, in point of design, the fleet ostensibly would be rejuvenated according to peacetime requirements; but there would be incorporated whatever modifications were possible to render ships more suitable as fleet auxiliaries, or more readily adaptable to the purposes of war.

The report disclosed that on May 31, 1937, the U.S. merchant marine consisted of 1,422 ocean-going vessels (of 3,000 deadweight tons or more) having a carrying capacity of 12,600,000 deadweight tons and that by 1942–5 years was taken arbitrarily as the time required to replace any considerable part of the fleet—92% of the ships embracing 88% of the tonnage would be obsolescent. The fleet had been built almost as a unit and it was growing obsolete in the same way.

On the basis of the findings and recommendations in the economic survey and the basic needs of auxiliary ships expressed by the navy, the commission expressed its determination to build 500 ships within the ensuing decade, at the rate of 50 per year. The commission's technicians went to work on a basic design for a cargo vessel. Leading naval architects were consulted, the opinions of qualified individuals and organizations were studied, and there

emerged the design that became the famed C-2.

The C-2 proved eminently satisfactory in every respect. It embraced every point of modernness that could be devised. Its designed speed was 15½ knots, though it could make more. Its characteristics were such that it could be adapted to almost any general purpose. It could be a general cargo vessel, a cargo-passenger ship within a wide ratio, or a pleasure vessel. It met universal favour, and with the larger and smaller versions of its design, remained the standard product of the commission at the end of the decade 1937–46.

From a military point of view, tankers were also of prime consideration. One of the first acts of the commission was to enter into negotiations with the Standard Oil company of New Jersey, which was then preparing to construct 12 tankers, for an increase in their speed to make them suitable for conversion to naval auxiliaries. The tankers normally would make 11½ knots. The commission agreed to bear the cost of installing equipment which would raise their speed 50% or more, of gun emplacements, oiling-at-sea gear and other features that would make them highly desirable in case of emergency. The cost was close to \$900,000 for each vessel, but the cost was repaid when the emergency did arise, and they went immediately into naval service.

The first cargo vessel delivered in the long range program went into service in June 1939. By that time there were shipyards in California, Florida, Pennsylvania, New Jersey, Massachusetts and Mississippi. Six months later, there were 16 yards in 12 states and 21 new C-type vessels had been put into service.

In September 1939 the outbreak of World War II in Europe caused a sharp revision of commission schedules. Even before that time, the commission had realized that with unrest in Europe reaching a critical stage, there would be an inevitable shortage of vessels to conduct what would remain of world trade. With the sanction of the administration and of congressional leaders, the commission increased its construction schedules to 100 ships a year, and went into 1940 with the assumption that it would be called on to bear the heaviest load of construction and operation in its history.

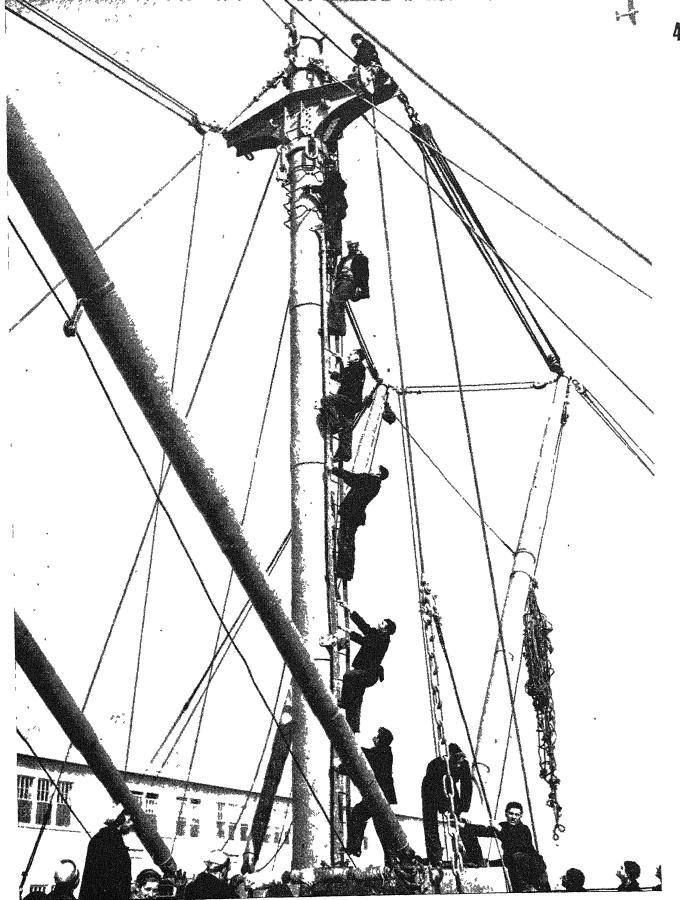

The events of 1940 were as critical for the Maritime commission as for any branch of the government. The army and navy frankly were preparing for any eventuality by increasing their personnel and their armament. The commission could do no less. It doubled its schedules again, for it had to consider not only the possibilities of the future, but also immediate, imperative needs.

In Jan. 1941 the president issued a plea for "More Ships—More Speed." The administration and the congress had conceived the lend-lease legislation by which there would be a legal basis for extending unlimited supplies to the anti-axis nations. It was clear by this time that even though cargo ships and tankers were being built much faster in the U.S. than by any previous methods, the nation was running a terrifying risk of being caught in a shipping squeeze. By unspoken agreement, the U.S. had become shipbuilder to the world, and the United States had to find a faster means of producing tonnage, else Europe would fall and the rest of the world become the prey of the axis.

It still required 9 to 12 months to build a ship in 1940. That was faster than the old methods, but not fast enough.

The British were experiencing large shipping losses in

1940. The United States, still a legally neutral nation, could not substitute in Britain's shipping tasks without violating whatever remained of neutral obligations. England placed an order in U.S. shipyards for 60 cargo vessels and sent over the plans on which a British tramp steamer, the Sunderland type, had been built.

It was a simple vessel, not particularly graceful, but sturdy. It was selected deliberately because it was believed its construction would be less complicated than most, therefore speedier. The commission's technicians reported that, with a few changes in design, a high degree of standardization both in design and methods, and a centralized system for getting ship components into yards, there would be excellent possibilities of instituting a shipbuilding procedure to build vessels of 10,000 deadweight tons in four-and-one-half to six months.

The commission drew up a design that standardized every 1 of the 15,000 or more parts that went into the vessel. It substituted welding for riveting wherever possible. The plans were drawn so that whole sections of the superstructure and other unified sections of the ship could be fabricated at the yard or miles away, whichever was convenient. The shipyards were to be laid out on an assembly-line basis, for a new technique was to be applied. The old orthodox method of shipbuilding was to build almost every component inside the yard. The new conception was for a shipyard to be the focal point for sources of supply that would reach into every state of the union. Shipyard workers were not to build ships, but to assemble them. The emphasis was entirely on speed.

Obviously, to build such a system there had to be a coordination of shipyards with sources of manufacture and supply. Hundreds of plants making components ranging in size from the smallest bolt to steam engines had to be supplied with drawings detailing the rigidly standardized specifications. Then, once these parts were manufactured, a most intricate system of scheduling had to be perfected, requiring closest relations not only between the commission and the manufacturer, but among transportation systems as well.

A major difficulty arose when propulsion for the new ship was considered. The navy's huge building program had pre-empted most of the capacity for building turbines. With extreme reluctance the commission was forced to adopt the steam reciprocating engine for the Liberty ship. The 10,000 ton vessel would do little better than 11 knots with the 2,500 horsepower, but there was no choice.

International developments in 1941 underscored the commission's hurried efforts. Sinkings of British and other Allied vessels rose from 453,000 deadweight tons in February to 774,000 in April. Occasions of German ruthlessness on the high seas were galling to America. The famous seizure of the "City of Flint" was one case in point. The culmination of these actions was the order given the navy on Sept. 11, to "shoot on sight" any axis molesters of U.S. vessels and the passage by congress of a bill permitting the arming of U.S. ships and their entry into all combat zones. The merchant marine was virtually at war.

By Jan. 1941 the number of commission shipyards had grown to 18, with 71 ways. Before the year was out there were 40 yards with 275 ways capable of constructing vessels 400 feet long with a 60-foot beam. In addition, there were yards building smaller vessels on the Great Lakes.

The distinction of launching the first Liberty ship went to the Bethlehem-Fairfield shipyard of Baltimore. Eight months after its keel had been laid, the "Patrick Henry,"

first of more than 2,600 identical Liberty ships, sailed from Baltimore in the service of the United States and the United Nations as well, for the Japanese had struck at Pearl Harbor three weeks before.

The outbreak of war between the United States and the axis powers unleashed the real shipbuilding power of the nation. For three years or more the shipbuilders had been developing their talents for design and for organization. It was to be a race against time; ships had to be built within weeks and days instead of months.

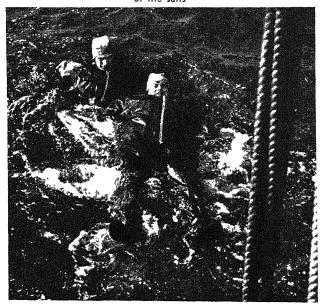

Sixty days after Pearl Harbor, the War Shipping administration (WSA) was created by executive order of the president. The commission was left free to build ships, and WSA was given control over all vessels in ocean commerce, power to seize alien vessels, the right to requisition U.S. flag vessels. Its authority was broad in all respects, for it not only controlled U.S. shipping, but represented the United States, as a leading maritime power, in the control of all Allied shipping. Within two months WSA had requisitioned the ships of the American merchant fleet, and was preparing for the increase expected from the emergency construction program.

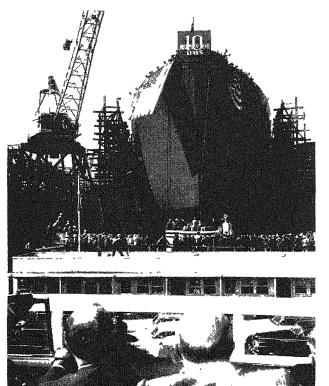

The request for shipping made by President Roosevelt after Pearl Harbor took the breath of U.S. shipbuilders. Production in 1941 had been 105 vessels aggregating 1,142,500 deadweight tons. The president's directive was for 8,000,000 tons to be delivered in 1942, and twice that much in 1943.

American shipbuilders were expected to build, within 24 months, more than twice the tonnage of the U.S. merchant fleet at the time of Pearl Harbor. There was no solution but a concentration on the Liberty program. Six new yards were added. Eight million tons of shipping meant almost 800 ships of 10,000 or more tons each, more than 2 each day of the year. The president's order did not contemplate launchings, but deliveries of vessels with steam up, ready to sail.

Liberty ships were welded instead of riveted in 90% of their construction. Women proved especially adaptable to welding, for the improvements in welding technique had made it less heavy and arduous, and women in shipyards, dressed in protective clothes against the welding arc, be-

Apprentice seamen of the U.S. maritime service drilling in the use of life suits

A new record for building a merchant ship was set at the Kaiser shipyards in Portland, Ore., on Sept. 23, 1942. Present at the launching of the "Joseph N. Teal," a Liberty ship completed in ten days, were President Roosevelt (left), and Henry J. Kaiser, owner of the yards. The shipyard later lowered this record to three days

came a commonplace part of the shipbuilding scene.

Delivery time fell rapidly. The Liberty ships delivered in Jan. 1942, required, on a national average, 241 days to build. In June, when 51 Libertys went into service, this national average fell to 122 days. By September the yards were delivering an average of 3 ships every day of the month and at the end of the year there had been delivered 746 ships of all types, having an aggregate total of 8,089,-732 deadweight tons. Five hundred and forty-two of them were Liberty ships.

By 1942 the commission had solved the turbine production problem. With the aid of the Defense Plants corporation and the expenditure of \$50,000,000 the small number of plants in the nation with the knowledge and skill to build this complicated machinery had been greatly expanded and new facilities created. By Sept. 1942 deliveries of C-types were doubled over previous months. As 1943 approached, production of C-types and tankers was being redoubled.

The banner year was 1943. In February of that year, production exceeded 1,250,000 tons, more than had been built in all of 1941. Before the end of March, five vessels were being delivered every day from American yards. By the end of June, the tonnage exceeded 1942 production, and long before, the commission had promised that if there was no lessening in supply of labour and materials, the year's tonnage total would not be 16,000,000, but in excess of 19,000,000 deadweight tons.

In Dec. 1943 close to 80 shipyards were building vessels under direction of the commission. They had passed the president's mark in November. During the last month of the year, 208 ships were delivered. The month's tonnage passed the 2,000,000 mark and brought the year's total to 19,238,626 tons deadweight.

In two years American shipbuilders had built almost two and a half times the total of the nation's prewar tonnage. They had replaced all the shipping losses of the Allies. The navy and the merchant marine had won the battle of the Atlantic, for monthly tonnage losses had declined from a high point of slightly more than 1,000,000 deadweight tons in March-the peak of the "wolf pack" tactics-to 257,ooo tons in December.

The commission's program now entered a new phase. With Allied tonnage at the 1939 level, axis raiding halted to a great degree, and adequate capacity for building turbine propulsion machinery, the commission stopped the emergency Liberty construction program, and turned to increased production of C-types, tankers, military vessels and the new Victory ship.

The Victory ship grew out of the Liberty program and was built by the same rapid methods. Making 18 knots or better when propelled by the larger of 2 turbine installations of 6,000 or 8,500 horsepower, it had the same deadweight capacity as the Liberty, but its speed made it a far more valuable ship.

The WSA was principally concerned, in the spring of 1944, with supplying General Eisenhower's command for the invasion of Normandy that came in June. The tempo of Atlantic shipping rose sharply. Materials moved into eastern ports with clocklike regularity, to disappear immediately down the hatches of vessels that came in a steady flow. WSA estimated that 3,700 ship days a month were added to the Atlantic run-the equivalent of adding 123 vessels to the fleet.

The surrender of Germany in May 1945 presented new problems. The army planned to withdraw more than

3,000,000 men from the European theatre. Many of them were destined for the Pacific-across the Atlantic, the United States and 4,000 to 7,000 mi. into the Pacific. Most of their equipment, routed through the Panama canal, traveled 14,ooo mi. The commission immediately began preparation for the huge troop movement by conversion of 400 cargo ships to troop carriers.

The surrender of Japan, however, brought the mer-

Merchant Fleets of Ten Selected Countries in Order of Their Importance, Number and Gross Tonnage of Sea-going Iron and Steel Steam and Motor Vessels of 1,000 Gross Tons and Over as of Dec. 31, 1945 (Excluding vessels operating on the Great Lakes and inland waterways and special types such as cable ships, ice breakers, etc.)

Vessels acquired through capture, seizure, transfer, etc., and operating under a country's temporary control were-excluded from such country's Dec. 1945 merchant fleet and added to that of the country from which acquired.

Included in the United States merchant fleet were (1) vessels which may or may not have undergone some degree of conversion when acquired by the United States army or navy, and (2) military type vessels originally designed as merchant ships and constructed under the United States Maritime commission construction program. Vessels strictly of military type such as LST's, frigates, aircraft carriers, etc., constructed by the commission were excluded.

chant marine to the end of the shooting war, as it did for the armed services. For the merchant fleet, however, the work was not over. Seven million fighting men were abroad. Nine out of every ten servicemen sailed home on ships under WSA control. By April 1946 most American soldiers had been repatriated. In addition to this transportation of troops, there was an insistent demand for cargo space for relief shipments to devastated areas.

As the tenth anniversary of the establishment of the Maritime commission passed in Sept. 1946, there were still major problems before the commission and the shipping industry. The wealth of tonnage that cost U.S. taxpayers more than \$15,000,000 was for sale under provisions of a Ship Sales act passed in March 1946. The Maritime commission was deep in its task of aiding conversion of the war-built fleet to private operation. It was selling warbuilt vessels to whomever would buy them, giving U.S. citizens first choice as to sale or charter, then permitting foreigners to purchase on specified terms. (W. W. Sh.)

Great Britain

The year 1937 was aptly described as the "false dawn of British shipping" after the long depression; the rise in freights, satisfactory as it was for the moment, was not so much due to improved trade as to the political results of Italy's Ethiopian war of 1935 and subsequent international events. The influence of the years following World War I was shown by the fact that the gross tonnage of British merchant ships, excluding tankers, was 17,400,000 compared with 45,500,000 under other flags, whereas in 1913 the figures had been 18,300,000 and 22,500,000 respectively. Britain's share of the world's carrying trade, particularly on the short sea routes to the continent, had declined steadily since 1920, and even the coasting trade had been invaded by foreign tonnage. Nevertheless, the earnings of shipping from foreign clients during 1937 supplied an invisible export which wiped out 30% of the visible adverse trade balance. The average age of the ships was satisfactory and in fast ships, refrigerated tonnage and ocean-going tankers Britain's share of the world's total was large.

In both the tramping and the liner sections, however, particularly the former, the situation was serious. The Shipping (Continuation of Subsidy) act remained in force for 1937, but as the average level of freights was above the 1929 datum line, no money was actually paid in spite of the decline at the end of the year. Until Aug. 1937, the tramp rates were satisfactory, permitting several owners to make up arrears of depreciation and declare a dividend, but in September they broke, partly through a reduction in business and partly through the delivery of a number of ships ordered when the revival started in 1935. By the end of the year they were down to the level which had been agreed as the minimum and continued to decline in 1938; by the end of Aug. 1939 they were nearly 40% below the level of Sept. 1937.

Later comparisons were impossible owing to lack of statistics during the war period.

The industry realized that a scheme of voluntary cooperation would be necessary after the end of the subsidy, and discussions were started to continue and increase the system which had operated effectively to maintain minimum freights for three years. The tramp administrative committee was established, with co-operation from the liner companies, and by the end of 1937 included 90% of tramp and a considerable majority of liner tonnage.

The minimum rates were based principally on the main grain trades, but markets not covered by them fell rapidly.

Foreign competition continued to be serious; in some cases it was assisted by lower running costs, in some by subsidies and in some by parties to trade treaties successfully insisting on buying f.o.b. and carrying all the British goods so bought in their own ships. In some cases the competition was largely political, as in the far east, where the Japanese carried out a vigorous campaign to exclude foreign, and particularly British, shipping. Liner business, being very largely controlled by international conferences, did not suffer to the same extent but frequently operated under a considerable handicap.

In the passenger section the sale or demolition of numerous ships during the slump had its effect, but those in commission did reasonably well and, to the surprise of many people, the Cunard White Star record-breaker "Queen Mary" of 1936 proved to be not only an excellent figurehead but also a very profitable ship. New tonnage, on improved standards, was built for the long distance services, although prices were high and few of the companies could order what they needed. Cruising continued to employ liners during the slack season on the various passenger routes.

The decline from the end of 1937 was shown by the fact that in the summer of 1938, 438,000 gross tons of British shipping were laid up, against 97,000, 12 months previously; in 1932 the figures had been 3,556,000, but many of those ships had been sold to foreign interests or broken up.

In view of the rapid increase of all running costs it was feared that a further reduction in freights or volume of trade would mean further large-scale laying up.

The very short period of revival, coupled with the obvious threats of Germany, caused the authorities to take action. In July 1938 the president of the board of trade stated that the government was willing to assist shipping, even to a considerable sum, but felt that the first move should come from the industry itself.

Fact-finding committees were appointed to carry out exhaustive inquiry into conditions and the influences which had depressed them.

Early in 1939 the shipowners presented their report on conditions and their suggestions for state assistance. They included a renewal of the tramp subsidy for 5 years, with the sliding scale previously used, so that the assistance would be reduced when freight rates approached the 1929 average and be abolished altogether when they exceeded it by 5%.

Allowance was made for the increased working expenses in allocating the total sum. On the liner side it was suggested that a defense fund should be set up, to be called upon only in certain circumstances, including state aid to rival flags.

In May 1939 the house of commons provided £2,000,000 for the purchase of merchant ships to form a reserve and £100,000 for their maintenance. The price of old tonnage to the shipbreakers was low, and a number of ships were purchased and registered in the name of the board of trade.

The outbreak of World War II in Sept. 1939 immediately put an end to the subsidy suggestions and the government reserve of ships showed its value. Many were added to it which had already gone to the shipbreakers but the demolition of which had not begun. The total tonnage under the British flag when World War II broke out was 17,891,134 tons gross, of which 15,508,000 tons was in ships of 2,500 tons or more. These included 360

passenger and mixed liners, 778 cargo liners, 808 tramps and 395 ocean-going tankers.

Government Control.—A large measure of government control was recognized as being necessary in wartime and before World War II began, preparations were made under the board of trade and admiralty. The nucleus of a ministry of shipping was established within the former, having the advantage of existing legal, financial and establishment services while it was being developed. That arrangement was continued in the earliest days of the war, although there was an agitation for a separate ministry from the beginning. The ministry of transport was concerned with war plans to facilitate the rapid turn-round of ships in the ports and to avoid congestion.

The ministry of shipping was established on Oct. 20, 1939, taking over the duties and staff of the marine department of the board of trade. The clerical staff was immediately greatly augmented; numerous volunteers entered from the shipping business and various bodies connected with the industry.

The new organization was soon bitterly criticized. It had inherited the duty of licensing every overseas voyage, and the tramping section of the industry complained that the absence of experienced tramp men in the executive caused constant misdirection and waste of tonnage. There was also considerable overlapping and lack of co-operation with other departments and it was complained that the ministry lacked authority when the ministry of transport or the admiralty demanded tonnage. Later the demands of the ministry of food and ministry of supply, and the control of dock labour by the ministry of labour added to the confusion.

The suggestion was constantly put forward that all merchant shipbuilding should be the sole responsibility of the ministry, but after much discussion it was successfully maintained that as priority was bound to be a matter of conflicting claims it should be kept in the hands of the admiralty, with proper liaison, as naval needs had to be considered first.

Growing criticism, and constant confusion through lack of co-operation between shipping, the ports and land transport caused the ministry of war transport to be formed in May 1941, combining the ministry of shipping and the ministry of transport. On the shipping side numerous departments and divisions operated, some of them inherited from the old organizations and some new.

Requisitioning and Management.—One of the first duties of the government was to arrange for the requisition of the ships which it needed for military and supply services and for the management of vessels taken from the axis, acquired before the outbreak of World War II as a reserve, or purchased later. In the first class there was no difficulty, for charter parties had long been agreed with the owners for the complete temporary acquisition of merchant ships, required as auxiliary cruisers or for other naval purposes. The unprecedented range of official demands complicated the matter, and the requisitioning of individual ships introduced many problems; in Dec. 1939 it was necessary to demand tonnage for badly needed Atlantic cargoes without any previous agreement having been made for rates of hire, and a comprehensive scheme

The general requisition of all ships except certain coasters was gradually applied during the first part of 1940; the ships being taken up as they reached a convenient port and then being managed by the owners on account of the government. Terms were finally agreed after long negotiation; the basis was that payments should cover average

operating expenses, calculated by practical experience with each class of ship, plus 5% per annum for depreciation of liners and dry cargo ships and 6% for tankers, with an additional 5% to cover the interest on capital. That was calculated on the actual first cost in the case of liners and on agreed average value for each class of tramp and tanker. The shipowners protested that the narrow limits laid down by the government for discussion were unfair, but the agreement was made subject to revision at any time. Such revision was repeatedly necessary as the running expenses increased.

The basic rate was by the month; for cargo liners it was 8s. per gross ton and for passenger liners from 10s.5d. to 13s.7d. per gross ton according to speed. For deep-sea tramps it varied from 6s. to 8s. per deadweight ton according to size, which governed the running costs to a great extent. There were many variations for special ships; an extra payment was made for motorships.

From time to time there were popular suggestions that large profits were being made by the owners under these agreements, but official investigation by the select committee on national expenditure and constant examination by the ministry showed that such charges were unfounded and that, owing to the inevitable time-lag between increased running costs and new agreements, the rates very frequently failed to cover the intended depreciation and interest on capital.

All ships under requisition, as well as those owned by the government, and prize vessels, were managed by the practical shipowners. They were under constant direction and were allocated to various routes, often far different from those for which they were designed, according to the needs of the moment. They were then loaded by the companies on whose berth they ran in rotation, involving an immense amount of accountancy and administrative work with reduced staffs. After 1940 when London and the east coast ports were constantly raided by German aircraft, all possible overseas ships were diverted to west coast ports, where their owners frequently had no organization, and special wartime ports were opened on the Clyde and elsewhere. A large part of their cargoes was transshipped to coasters and carried to ports which were regarded as dangerous for the big ships.

New ships built during World War II and those acquired by the government before the war, or captured from the axis or while blockade-running, or later acquired by the government either by purchase abroad or after war damage which caused them to be regarded as constructive total losses, were rechristened with names beginning with the word Empire and placed under the management of established firms at agreed rates. As the war progressed a number of the U.S. Liberty ships were transferred to the British flag for operation under bare-boat charter terms. They were all given names having the prefix Sam (Samadang, Samcalia, Samtucky, etc.) to signify Uncle Sam, and were allocated to the companies for management. Many ships which escaped from occupied Allied territory, or were chartered from neutrals, were managed in the same way without rechristening.

Non-Commercial Service.—During World War II the work of merchant ships was divided into commercial (although principally on behalf of the state) and non-commercial service, the latter being entirely for the fighting forces. Merchant ships had been the reserve of the navy from the earliest days; their functions had changed but they were still essential.

Charter parties for these non-commercial services were adapted from previous ones in force long before the war, varying according to whether the owners managed the ships, supplying and feeding the crews, or the government took them over "bare boat" and did everything necessary. When the admiralty supplied the crew, the majority temporarily joined the royal naval reserve. These charters could be terminated at any time in any port, but natuilly that was done only when the ship could be immediately employed on cargo work; an auxiliary warship took months to reconvert at the responsibility of the admiralty.

Their principal naval duties were as auxiliary cruisers and aircrast carriers. Medium-sized ships of big suel capacity were the most valuable in the former role as they could overcome bunkering difficulties. Nevertheless, they were recognized as being very vulnerable, for it was impossible to give them more than the most primitive protection, and several were lost with heavy casualties. Among these were the Peninsular and Oriental "Rawalpindi" and the Aberdeen-Commonwealth "Jervis Bay," sunk fighting against impossible odds. In the acute shortage of regular cruisers, and with the long distances to be patrolled, their use was unavoidable, but they were paid off as soon as possible. They mounted six to eight 6-in. guns with antiaircraft backing; some carried aircraft and catapults. The great majority of the auxiliary (escort) aircraft carriers were American ships under lend-lease, but certain fast British cargo ships were converted.

An enormous number of small craft were commissioned in combatant roles. Minesweepers included fishing vessels, shallow-draught paddle excursion steamers and a few miscellaneous small vessels. Other excursion steamers, having broad decks for their passengers, made excellent anti-aircraft ships. In non-combatant roles ships were used for carrying naval stores and defense boom material; fitted with racks and safety devices, they were used as ammunition issuing ships to replenish warships' magazines. Numerous coasters did naval work, while privately owned tugs were commissioned for dockyard and other work and were the mainstay of the salvage section. Coastal liners and short sea traders were specially fitted as rescue ships to follow the convoys and pick up survivors without endangering the other ships.

Other merchantmen, including passenger liners, were converted into depot ships for various types of small warships. They were generally fitted to carry out repairs as well as to house the crews in port and to dispense the necessary stores and ammunition. Some were converted into "amenities ships" for the Pacific, elaborately fitted to afford men rest and relaxation and even to carry a brewery. Others became floating dockyards able to effect a remarkable range of repair work. Many ships were so altered by conversion that it was impractical to reconvert them to commercial use. The coastal command of the royal air force also used tonnage for depot and repair purposes.

In the case of the army, most of the ships were required for trooping and store carrying, the normal functions of the merchantman in war. In the former the authorities were handicapped by the reduction in the number of passenger ships, particularly those of handy size, between World Wars I and II. In 1939 and 1940 troopships, although largely gutted for their conversion, carried the same number of troops as passengers on commercial work, but later the number was increased by stages and comfort diminished. The capacity of the Cunard White Star liners

"Queen Mary" and "Queen Elizabeth" was approximately 5,000 when they were first commissioned, in the latter stages they were carrying 15,000 officers and men. Cargo vessels and, for the shorter distances, cross-channel packets and excursion steamers, were also used for trooping, many being lent to Allied governments. Considering the circumstances the losses of transports, especially when loaded, were remarkably small.

In the case of hospital ships, the structural alterations were not usually so great; a wide range of types were employed, principally handy-sized liners and packets, and the losses were heavy owing to the fact that under the Geneva convention they were not escorted like transports.

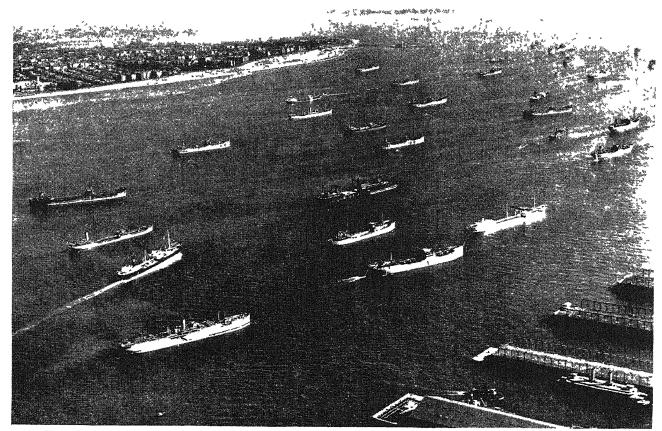

In the case of ordinary store and supply ships, little or no conversion was necessary and it was usual for them to pick up a commercial cargo as soon as their military stores were discharged. With operations ranging from Normandy to the Pacific, every type was employed. One important duty was the carrying of gasoline for the army and R.A.F., for which certain preparations were necessary. It was originally packed in "flimseys" at great risk to the ship, but later the familiar "jerry cans" were used, the holds being protected to prevent incendiary bullets penetrating the sides and starting fires.

Commercial Service.—Commercial voyages, after the general requisition in 1940, were all on behalf of the government; an increasing proportion of the cargoes were on government account and when they were for private interests the profit went to the treasury.

In Sept. 1939 freight rates of British ships were rigidly restricted and voyages were made subject to licence, wheat and other necessities already being imported by the government' were at fixed rates. In November British ships received 325.6d. a ton for grain from the River Plate, but the supply was not nearly sufficient and the government was paying neutral ships 6os. On Dec. 4 increases were announced, 43s.6d. for British ships and 65s. for neutrals, with the latter becoming more difficult to arrange as they found greater profit on safer voyages elsewhere. On the export side efforts were made to maintain the slogan "Business as Usual," and to encourage exports for the sake of foreign currency; but as mobilization proceeded and the munitions industry demanded more labour the policy had to be abandoned. Exports were strictly controlled, while British dominions and Allied countries were forced to restrict their imports for economic reasons. All shipments of commercial cargo gradually came under a permit system of

The progress of World War II constantly changed the character of the commercial service. Until the German invasion of Norway, a large traffic still remained with northern Europe in spite of losses. When the Scandinavian timber trade was interrupted by the blockade, supplies had to be obtained from Canada, both east and west, and a certain amount from South America. Mediterranean services were maintained by their normal type of short sea trader carrying foodstuffs, etc., until Italy entered the war. Then the closing of the central Mediterranean forced ships to use the Cape route, demanding a vessel with bigger bunkers. The small ships caught in the eastern Mediterranean maintained a feeder service to Egypt, where the cargo was transshipped. When the United States passed the "cashand-carry" legislation, all the available fast cargo ships were transferred to the north Atlantic service, but after Pearl Harbor the rapidly growing U.S. merchant service took a large part.

To increase essential imports, troopships and army supply ships collected as much commercial cargo as possible

Huge fleet of 114 merchant vessels in New York harbour in Sept. 1941, including British, Norwegian, Dutch and Icelandic ships

on their return voyages, providing it did not interfere with their military work; but the diversion had to be as small as possible although fast meat ships would return from the middle east campaign via South America.

Measures were taken to increase the carrying capacity of the available tonnage. The greatest difficulty was waste of time, unavoidable when convoys had to be protected by insufficient escorts but frequently unnecessary and exasperating. Great improvements in that direction were effected by the establishment of the ministry of war transport in 1941. Ships were allocated to the shortest haul possible; imports from the north Pacific, for instance, were finally covered almost entirely by the delivery voyages of new ships built in western Canada and the U.S.A. The freeing of the Mediterranean saved thousands of tons. Many ships were made to carry more by raising the load line under careful precautions and much time was saved by reducing the number of loading ports to one or two; sometimes small vessels were used for feeder services from the remainder.

Careful peacetime precautions were impossible with tonnage in short supply, and cargoes had to be loaded with small regard to possible contamination, but surprisingly little food was spoiled. Block purchases permitted "block loading" of cargo, with a saving of space and time at the ports.

There was a struggle for priority between the different importing departments, which caused great waste in the early days; later the demands were examined by the director of commercial services in the ministry of war transport and approved requirements were then reported to the allocation of shipping tonnage division which, in conjunction with the ship operating division, arranged details.

In spite of the need for raw materials and munitions, foodstuffs had first priority. Every care was taken to make the greatest use of the available space; on the day World War II started wireless orders were sent out to all ships carrying chilled meat to freeze it down at once. Dairy produce was given high priority, particularly cheese on account of its food value and the small space that it occupied. Eggs in the shell were soon prohibited, and fruit after the end of 1940. With some adaptation many fruiters carried ordinary meat cargoes successfully. Refrigerated meat ships made a special target for the Germans and casualties were high.

The passenger side had equal difficulties, especially as so many of the biggest and fastest ships were taken up by the navy and army as auxiliary cruisers or transports. As many ships as possible, however, were left to the service, and some relief was afforded by the U.S. government prohibiting its nationals from travelling in belligerent ships, but later only the minimum number of ships were left to maintain necessary skeleton services. The mails were carried by any convenient ship, naval or mercantile.

When all ships came under general requisition, the whole of the profits of the passenger business went to the ministry. The owners did all the necessary business and management for set fees; the ministry received the fares and fixed the rates and conditions. All passages were subject to strict priority, and the accommodation of each ship was distributed as the ministry considered necessary; naval and military passengers came first; officials with wives and families and civil servants followed them. The rest was allocated to the dominion and colonial authorities on the route to distribute to their people according to the necessity of their voyage; if any passage remained it went to civilians travelling in the national interest or, in excep-

tional circumstances, to those who could show strong compassionate grounds. The ships were packed to their utmost capacity, extra berths being fitted wherever possible, and the normal limit of 12 passengers without a special licence was relaxed, although lifeboat and other safety regulations continued. Each passenger was bound to strict secrecy concerning the name of his ship, voyage, port of departure and any information that could be dangerous. Booking was "blind," without the passenger knowing what accommodation or what ship he would get, and very short notice was given to assemble at a named place, often an open roadstead in which the convoy was assembling.

Manning.—Manning proved one of the greatest problems during World War II, not from lack of spirit but from difficulties of training and organization. A general invitation to seamen and engineers who had left the sea to register for return in war met with a ready response; the registration of all former seamen between the ages of 18 and 60 was made compulsory in 1941, but it was found unnecessary to call upon any who had been ashore for a long period.

The number of men choosing sea service under the National Service act was more than the royal navy could absorb, and the rest were trained as merchant seamen in special establishments.

The ordinary voyage articles were changed to suit war conditions in 1940, and before the invasion of Normandy special articles ("V-articles") were prepared which covered the increased danger and met with a very fine response Discipline varied; a great deal of trouble was admittedly experienced, and it was often necessary to prosecute under

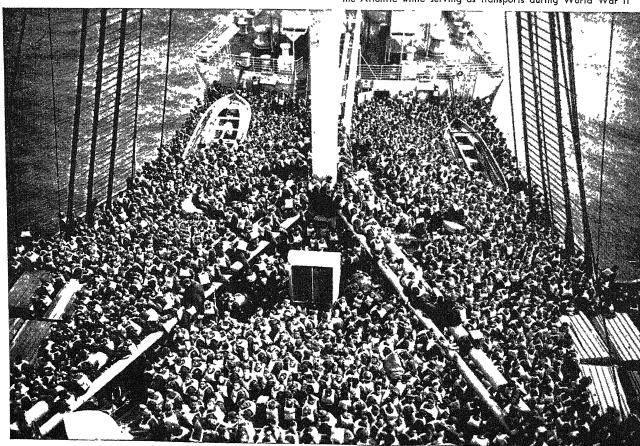

the defense regulations with severe penalties, but the conduct in action was almost invariably excellent.

Opportunity was taken to try the longed-for experiment of continuous service for seamen instead of the majority being paid off after every voyage. In May 1941 the Essential Work order was extended to the merchant navy, and the M.V. reserve pool was established. All officers and men became members at the end of current articles and remained on pay until appointed to another ship. Arrangements were made for companies to retain their regular employees, and they were allowed to maintain domestic pools provided they did not withdraw too many men from active service. Officers and men enjoyed their regular leave on pay and could be employed on relieving work, guard duties in port, etc., until they were required to return to sea. There were a number of cases of men defrauding the pool, but the great majority appreciated its facilities.

During World War II the basic rates of pay remained almost stable, but they were greatly supplemented by al lowances. The first scale of war risk bonus was published in Sept. 1939, varying with rank, and was later greatly increased. It was paid while the officer or man was on atticles, and a special war risk bonus was paid for dangerous service. Differential monthly payment was adopted in Dec 1940, and qualifications in gunnery, etc., received allowances.

Compensation for injuries and pensions for dependents were arranged on naval scales for comparative ranks; many details were left uncovered and had to be arranged by

Deck drill aboard the "Queen Mary" for U.S. troops en route to England in Nov. 1944. Britain's two giant luxury liners, the "Queen Mary" and the "Queen Elizabeth," carried 1,243,538 troops across the Atlantic while serving as transports during World War II

agreement, but the owners voluntarily increased their obligations in cases not covered by the regulations.

The Postwar Period.—Immediately after the surrender of Germany some relaxation was possible in the wartime regulations, but there was no general cancellation until the defeat of Japan. Even then it had to be gradual, with the large fighting forces still in the field to be supplied and relief work urgently needed in liberated countries. The Allies and certain neutrals pooled their tonnage for a certain period, while each country maintained its own measures of control. When the general requisition scheme came to an end, British shipowners regained a measure of control over their own ships but they were still regulated as to the voyages that could be undertaken and the freights charged.

In addition, a number of ships remained under particular requisition, especially transports and army storeships. The former were employed repatriating British, dominion and Allied troops in units and, when demobilization was staited, a large number of time-expired men in details. The system left a number of berths vacant for civilian passengers under the same conditions as in the later stages of the war, and until the latter part of 1946 the ministry still retained control of the passenger bookings of the ships which were in their owners' hands and reserved a large part of their accommodation for official travellers. Meanwhile the waiting lists on all the principal routes ran into many thousands and numbers of travellers on important business had to go by air.

Bottlenecks in the passenger business were caused by the delayed release of ships on transport duty, and the fact that many liners requisitioned by the navy had been so drastically altered that reconversion was slow or impossible. A minimum of 6 months was usual, and the cost frequently ran to £1,000,000. The Cunard White star "Queen Elizabeth," with a gross tonnage of 83,673, was reconverted as a passenger ship, in Oct. 1946.

During World War II the ministry had inaugurated a scheme for replacing war losses by permitting owners who had suffered to register for the purchase of government-built ships after the end of hostilities, managing them in the meantime. This still left a large number for disposal, in addition to tonnage surrendered by the axis. In Jan. 1946 the first invitation to tender was issued, cataloguing 528 vessels of various types with the minimum price that would be accepted for their purchase or bare-boat time charter. In the case of practically all the ships of satisfactory design and condition the former was largely exceeded but many tramp owners, in particular, preferred to charter for a period of years.

Demobilization of the seamen who had gone to sea under the Military Service act was based on the age-and-service system of the fighting services, but owing to different conditions it was impossible to carry it out so methodically. All were given the opportunity of remaining in the merchant navy; a number of the young men, as well as many temporary ratings demobilized from the navy, embraced it eagerly but the great majority of the older men preferred to take their discharge.

British Dominions.—The large coasting fleets under the Canadian, Australian and New Zealand flags were greatly depleted by requisitioning for war service, but the numerous ocean-going ships built in the two former dominions were kept under state ownership, although a large proportion was chartered to the British government, until after World War II. Then many of the Canadian ships were sold to private owners, but the process proved more difficult in Australia. The South African government fleet was aug-

mented by prize tonnage and was used principally for national supplies; at the end of World War II there was great enthusiasm for shipping and a number of new companies were launched, mostly with purchased ships. In India there was equal enthusiasm, and numerous native ownerships were started for Asiatic international traffic as well as coastal, with the hope of very generous help from the new government. (F. C. Bo.)

Shoe Industry

The ten years 1937 through 1946 were the most eventful years in shoe history. During that period the industry was confronted with problems that had no precedent, for, in addition to the peaks and valleys, recessions and booms that had become the accepted pattern, there was the terrific influence of World War II. Ten eventful years in the shoe industry did not record the same astounding advances and progress that the sciences or the fields of invention made, but they indicated that shoes are universal—the one article of wearing apparel that is a common necessity and as such influences all civilized people.

United States.—In 1937 the country was beginning to emerge from almost ten years of depression, and industry was again thinking in terms of manufacturing, merchandising and distributing its shoes. In 1946 the first full postwar year with its problems of economic readjustment, there were shortages of materials and greater demand than ever for shoes because of the high rate of employment and earnings. The intervening years had their full complement of difficulties, hazards and rewards.

The United States, as the largest consumer of leather and the greatest shoe-producing country, maintained a steady per capita production and consumption in the years prior to the war. Far-reaching international and domestic events catapulted the industry out of its normal channels and, beginning with 1941, demand for shoes caught up and almost outdistanced supply. With the entrance of the United States into World War II production was stimulated and organized to the limit of the nation's resources. Every available man and machine was employed. The greatest problem of the industry was to bridge the gap between supply and demand-a gap created by the diversion of supplies to the armed forces and by extraordinary purchasing power. Consumption of shoes increased sharply and would have continued to increase but for the limiting factors of wartime supply.

All branches of the industry—tanners, manufacturers and retailers—co-operated wholeheartedly in the transition from peacetime operation to all-out war effort. The government became the biggest and most important customer for boots and shoes. For the first time in history, heavy government buying was accomplished without an immediate spiral of prices on consumer goods; but it was inevitable that priori-

ties, allocations, restrictions upon consumption, price control and rationing would follow. Various government agencies were established, and key men were recruited from industry to draft the orders and administer the laws. The War Production board was set up to regulate production, and the Office of Price Administration was established to keep prices from getting out of line. The shift from abundance to the economic realities of war and slowly growing scarcities had to be clearly and plainly translated to the public.

Demand and potential supply were brought into closer balance by Footwear Conservation order M-217, eliminating wasteful shoe practices, banning new designs and constructions, limiting colours to black, white and three shades of brown; and directing available supplies of critical sole leather into the manufacture of the most essential types of shoes. Amendments to order M-217 were issued from time to time, and in Aug. 1944 colour restrictions were eliminated. New designs, lasts and patterns were allowed, providing manufacturers could adopt them without employing additional workers, for the manpower shortage was becoming increasingly acute.

Industry withstood the impact of greater production for the armed forces, lend-lease and civilians until the growing concern over shortages in sole leather and materials necessitated that the country go on a shoe rationing basis in order to ensure an equitable distribution of available shoes. On Feb. 7, 1943, Shoe Ration order 17 was issued limiting consumption to three pairs per person per year. This per capita consumption was reduced to two pairs per year during the later course of the war and ebbed to almost one pair before shoe rationing was lifted Oct. 30, 1945.

Despite shoe rationing, however, the civilian population of the United States was well shod during the war period. Non-rationed shoes, which did not utilize leather or other essential materials in short supply, and which could be manufactured with the available manpower, supplemented shoe wardrobes and helped fill consumer demand for extra shoes.

The shoe industry stripped down to the bare essentials and became a part of a restricted, restrained and regulated war machine. The end of hostilities, first in Europe and then in Japan, eased the situation to some extent. Large army cutbacks released some leather which could be routed through for civilian production.

As soon as it was feasible, many of the controls were lifted and the industry was back to the job of reconverting for peace. Enormous shortages, accumulated during the war years, however, still remained.

When the United States entered World War II, the demand for leather (q.v.) was almost trebled. Military requirements were the first consideration and took up more than 30% of the sole leather. A substantial supply of leather was allocated for repair and rebuilding, and these operations by the army conserved some 22,000,000 sq.ft. of military quality upper leather. Of the U.S. army's total footwear procurement in 1944, 17% was provided through rebuilt. shoes, which totalled 6,000,000 pairs—issued to

troops stationed in the United States only. About 4,000,000 pairs that could not be put into condition for army use were repaired and sent to the liberated countries.

United States tanners did a magnificent job—supplying not only the huge military requirements and civilian needs but taking care of lend-lease and United Nations Relief and Rehabilitation administration obligations as well. The United States filled a good part of soviet Russia's military shoe requirements in addition to furnishing leather and shoes to the British, French, Polish, Yugoslav, Philippine and Chinese armies. Sole leather produced in the United States was worn by the fighting men of the United Nations all over the world.

Since the major part of the available sole leather supply was marked for the military, shoe men were hard put to get enough soling material for their civilian requirements. New materials and substitutes evolved. Plastic soles and composition rubber soles came into production and helped solve the situation to some degree. Because these soles were durable and long-wearing, they were used effectively on men's and boys' and children's shoes.

In view of the fact that 80% of the world's hides ordinarily had gone into boots and shoes, it was imperative to set up some board that would equitably allocate hides and skins, and the Combined Raw Materials board was put into effect. The United States, Great Britain and Canada co-operated in this initial action and invited other nations to participate—in order to prevent unrestrained price inflation and ensure a fair channelling and distribution of exportable surpluses. Careful studies were made by the C.R.M.B., and joint commissions were sent to Argentina, Brazil and Uruguay, the largest hide producers in South America. Exchange visits also took place between the United States and the United Kingdom, in order to determine the world's supply and a proper distribution of those materials.

The Combined Raw Materials board was replaced by the International Hides, Skin and Leather committee, an international body on which the United States, Great Britain, Canada, Belgium, Denmark, France. the Netherlands, Norway, Spain, Sweden and Switzerland—the major leather-consuming nations of the world—were represented. Its duties were to determine the types of 1aw, semitanned and tanned hides which were in global short supply and to recommend appropriate agencies, national and international, for fair distribution of supplies. This international committee functioned effectively in maintaining controls until it was dissolved June 26, 1946.

With the war over and international controls dropped a leather-hungry world frantically tried to obtain hides and skins and tanning materials from all parts of the globe. It might seem strange that bankrupt nations would fight to buy world raw stock and leather at higher prices; but the answer was that they would do without almost everything else to get foot coverings.

Peak producing and selling of shoes in the United States could be credited to the progress achieved by U.S. designers. At the decade's end fashion was originating in the various centres of the United States and then gravitating to the European countries.

Stretchable shoes were introduced in the United States in 1938. Elasticized yarn was used as a backing for leather, and the shoes yielded to every movement of the foot—but always returned to the original contour. Buckles for fastening and gores for snugness could be discarded, and there was an immediate acceptance in the women's field. From a meagre 800,000 pairs in 1939, production increased to 80,000,000 pairs in 1942 before elasticized yarn became an essential war product.

One of the outstanding developments in the shoe field in the United States was the introduction of the sliplasted or California process of shoemaking. This process was used in the production of most of the platform type, casual shoes which were, in the main, unrationed and therefore had a wide appeal.

In its simplest form the California process was nothing more than the assembly, as a unit, of upper, sock lining and platform cover to form a pocket into which the last was inserted before the platform material and outer sole were attached. Lasting could be done by hand, in which case it was generally said to be slip lasted.

Great Britain.—Despite limited resources of raw materials, shoe production in England had always ranked high in national importance. In 1935 England produced about 132,468,000 pairs of shoes, and although no statistics were available for the years 1936 through 1941, production undoubtedly remained steady and consistent. During World War II boot and shoe retailers, along with other merchants, carried on courageously, but shortages of leather and other materials, as well as restrictions in trade, produced a great many changes in the established economic and social structure. A considerable number of stores were forced out of business since civilian footwear for the domestic market was radically curtailed. Some of the better stores had to close their doors several days of the week, having no stock to offer their customers.

A clothes-rationing system went into effect June 1941 with the object of providing a fair distribution of available supplies. The government gave as its basic reason for rationing the maldistribution of clothing and footwear.

In England shoes were not rationed specifically as such but rather fitted into the wider field of clothing. Each civilian had an issue of coupons which were expendable for clothing, including footwear. Men's shoes were scaled to 17 coupons, women's 5, children's 2 and infants' 1. Originally 66 coupons were issued, but these were cut down later to 48 per year.

Clothing coupons in England put a different value on things. No one considered the cost in money but rather in cost of coupons. High-priced articles were in greatest demand for it was felt that they would last longer. Consumer rationing in Great Britain limited consumption for leather footwear and other apparel to about 50% of the prewar figure.

In order to ease the shoe situation wooden-soled shoes were introduced, and Britain's board of trade ruled that a percentage of civilian footwear had to consist of wooden-soled shoes. Utility shoes—plain, practical, extremely limited in design—were standard in England for a full 50% of production; the other 50% were free of all restrictions of colour or price.

The British shoe industry didn't let the war stop its investigation in connection with the improvement of the product, techniques, shoemaking, lasts and general efficiency. Studies were continued throughout the war by the British Boot, Shoe and Allied Trades Research association and, although making of new machinery for the footwear industry was greatly restricted, small improvements were affected in existing machines.

With the war over England again looked to her export

markets, and several groups of British shoe men made trips to the United States and other countries to re-establish their contacts, for British shoes, especially in the men's lines, had a good acceptance abroad.

Canada.—In Canada, too, shoes proved to be a common denominator. All the problems and difficulties that continued the shoe industry in the United States and England were part and parcel of the problems and difficulties that Canadian shoe manufacturers faced. Materials shortages and lack of skilled manpower were acute, and the armed forces took a large percentage of the output of men's shoe factories and factories making women's welt shoes.

An Imperial Hide pool was created for the underlying purpose of ensuring adequate supplies of hides and skins to the tanners, and the Canadian Wartime Price and Trade board was given the power to fix maximum prices and mark-ups and to control exports of hides and skins—in order to maintain price stability. During the course of the war this same board issued orders further restricting styles, colours and finishes of leather.

The Canadian method of controlled raw materials at the source permitted better distribution of shoes, and Canada never had rationing as the United States had it. The retail stores imposed their own rationing on customers to maintain a control of shoe sales. Some of the large establishments did rather extensive shoe repairing to help consumers straddle the gap and extend the life of the shoes they had in their wardrobes.

Price controls operated successfully in Canada and in spite of restrictions, Canadian trade, in the aggregate, fared well.

Europe.—European countries, generally, found it impossible to maintain production. War activity, heavy military requirements (for despite mechanization and modernization, armies still travelled on their feet), materials shortages, regulated production, controlled consumption, pricefixing and lack of manpower all contributed to their difficulties. Stoppages of leather and other raw material imports drastically curtailed shoemaking, and almost every European country resorted to substitutes of one kind or another. It was amazing what necessity and ingenuity could produce.

In Sweden, where the living standard was above the level of the rest of Europe, it was necessary to institute drastic rationing when the supply of leather from the Argentine stopped. Overnight a ration of one pair of shoes for each adult for 18 months was applied, and only one repair for the same period was permitted. Most of the other European countries followed suit—to stretch available supplies.

In prewar Czechoslovakia the Bata shoe organization at Zlin shipped to the United States more pairs of shoes than all the combined manufacturers in the United States exported to all the countries of the world. These were low-priced shoes and caused manufacturers in the U.S. great concern. When Hitler came into power and captured the plant, its equipment, goods and capital, the United States immediately terminated all concessions granted to Czechoslovakia in which shoes from that country were given favourable tariff consideration. After the war the Czechoslovakian government took over the factory in Zlin and its facilities shifted to state ownership; but the Bata interests in the Netherlands, France, Switzerland, England, Canada and South America continued to be very active.

Frogskins were introduced in France and made into elegant shoes; the French could always be relied upon for that spark of genius that made Paris the fashion centre of the world. During World War II that centre of fashion shifted to the United States, but the French later made a determined effort to get it back.

Wooden-soled shoes were accepted, grudgingly at first but matter-of-factly thereafter, in all the European countries. Pigskin, used in Germany for years in the manufacture of gloves and bookbindings, was substituted for calf and kidskin leather in the manufacture of shoes. Ersatz products included glass shoes of nonsplintering plexiglass.

Latin America.—A study of the shoe industry during the eventful decade would be incomplete without mention of the South and Latin American countries, which became increasingly important as factors in the production of shoes and leather. The decade was marked by a steady expansion of shoe-manufacturing facilities. Many plants were built in areas where none existed before, and shoe machinery was imported from the United States, Germany, Great Britain and France. Growth of domestic leather production in these countries after 1939 was chiefly caused by a greater dependence of manufacturers upon domestic materials; during the war it was not always possible to obtain needed products from foreign sources, and the industry had to turn more and more to local manufacture for fabrics, rubber and other products as well as labour. Hides were available for shoe production in sufficient quantities in most of the countries for shoes to be produced both on mass scale in factories and by hand.

South American styling in patterns and colours was remarkable, for shoemakers had available manpower and the people of the countries had money and a desire for new and unusual footwear.

Argentina was one of the outstanding South American countries in the shoe and leather industry. Hides available for export, after taking care of domestic needs, were in quantities to give Argentina a favoured place in the international market. After the International Hides, Skin and Leather committee was dissolved and international allocations were dropped, the competitive market for Argentina's hides was wide open.

Shoe production was a natural development in the South American countries inasmuch as both raw hides and quebracho extract were readily available. Large tanneries were built in Brazil, Chile, Colombia, Ecuador and Peru.

In Mexico there was a decided increase in the production of leather shoes during the war years. Mainly responsible for this trade were the increased purchasing power of much of the population and the dwindling supplies of domestic footwear with canvas uppers and rubber soles. Wartime conditions and demands had a favourable effect on the footwear industries in Mexico after 1939. Production improved in quality and quantity. Huarachos—the

sandal type with uppers of woven or planted leather and soles of leather—made the most important gain as far as pairage was concerned. A considerable quantity was exported to the United States. Alpargatas, with labric uppers and cord or rope soles, were more generally pur chased by the native population, for they were available at a low price.

Japan.—The Japanese found that they could get a 750-ft. hide off a whale, and its 3-inch thickness split into three sheets for a possible production of 2,250 ft. of leather, and the Japanese fishermen caught about 800,000 sharks annually. These could be converted into the manufacture of about 2,000,000 pairs of shoes or about one-third of Japan's annual requirements before the war. Philippine mountain snakes were tanned for shoes but because the supply was so limited, they could be used only in high priced footwear. (See also Fashions, Womin's, Liahiir)

BIBLIOGRAPHY.—Boot and Shoe Recorder from which the basic material of this study was obtained. (E. G. AN)

Short, Walter Campbell

The army, in a report of Aug. 29, 1945, ascribed part of the blame for the Pearl Harbor disaster to Gen. Short, declaring he had failed to take adequate incasures "to alert his command for war." On the same day, Gen. Short replied that he had acted in accordance with information "available" to him at the time, adding: "My conscience is clear."

Shows (Animal)

Livestock, Agricultural.—Livestock and agricultural shows reached a maximum of size and influence during the five years preceding the outbreak of World War II. Worldwide restrictions of travel, transportation and trade during the four years from 1942 through 1945 had a marked curtailing effect on such events. With the cessation of the active phases of war, these fairs and expositions returned to some measure of their prewar status in the United States, Canada and South America. Great Britain, however, first to suffer cancellation of its long established shows of this nature, was not able to resume them immediately.

The oldest established major livestock show of the United States was still the Southwestern Exposition and Fat Stock show at Fort Worth, Tex., a huge and colourful exposition reflecting in spirit and substance the vast cattle country of the southwest U.S. The Fort Worth show suffered less from wartime restrictions than did most events of its class. Formerly held in the Fort Worth stock yards, its exhibits were cut to include market animals only—steers, wethers and barrows—in 1943; but in 1944 it was reopened on a much more extensive basis in the Will Rogers Memorial amphitheatre. The full exposition went on that year and was repeated in March of 1945 and 1946. A rodeo—one of the country's finest—continued to be the chief

The National Western Stock show in Denver, Colo., was the only large sectional exposition in the United States that continued uninterruptedly during the decade 1937–46. The Denver show was held adjacent to—and in some of its phases—directly in the Denver union stock yards. Its coliseum was one of the few show buildings in the United States not requisitioned for war and military purposes for the duration of hostilities. At the end of the decade, the show was planning a new coliseum.

Always in the fore-rank among the country's livestock shows from the time of its inception in 1907, the Denver show was the setting of impressive displays of Hereford and Aberdeen-Angus cattle. During the war, competition for quarter horses was introduced. These classes developed into one of the principal features of the show. Quarter horses vied for top interest with the perennially popular Hereford; huge ringside crowds followed both of these events.

Denver is also famed for its huge exhibitions of commercial feeder cattle, shown, judged and sold in carload units, as well as for its purebred beef bulls, also exhibited in carlots. These continued to be featured in the stock yards proper; this phase of the show was established as a source of supply of top quality cattle in feeder flesh for cornbelt fattening and for quality bulls for range use. It also remained the setting of one of the largest purebred Hereford cattle sales of the year, an event highlighted in 1945 by the sale of two bulls at \$50,000 each. Following the sale, the bulls were brought to the Brown Palace hotel and led into the lobby on the occasion of a banquet.

Four-year old Aberdeen Angus bull, valued at \$100,000, which was named champion for its class at the International Livestock exposition held at Chicago, III, in Dec. 1946 A Texas show which grew to national note during the decade 1937-46 was the Houston Live Stock show—a January event featuring both beef and dairy exhibits.

Prior to 1941, the Pacific International Livestock exposition at Portland, Ore., the American Royal Livestock show in Kansas City, Mo., and the Aksarben Livestock and Horse show in Omaha, Neb., were all of major national rank. During the war, however, competitions were restricted to fat stock only, and on a far smaller scale.

The American Royal—after an interval of four years—returned to its former prewar status as a full exposition in 1946. Staged in a spacious amphitheatre at the Kansas City stock yards, it drew the largest attendance of its history in that year. Its horse shows drew capacity crowds at each performance and its exhibits of purebred Hereford, Aberdeen-Angus and Shorthorn cattle came close to matching the best turnouts of these breeds in prewar times.

The American Royal in 1946 was the focus of national attention and publicity in the sale of its grand champion steer—a white-faced specimen, shown by an Iowa 4-H boy, which far outdistanced in price any other ever sold at any show in the world. In an auction the steer brought \$35.50 a pound or a total price of \$42,600.

An important west coast sectional show was the Great Western Live Stock show in Los Angeles, Calif., scheduled annually during the first week of December. Added to the list of postwar events in that area was the Grand National Live Stock exposition in the famous Cow Palace in San Francisco, Calif. This show was held Nov. 15–24, 1946—becoming one of the major sectional western events of postwar times.

State fairs occasionally matched some of the winter ex-

positions in the size of their livestock exhibits and exceeded them in displays of farm produce. Shows of this class were forced to shut down completely during the war period, for the most part, after having arrived at a pinnacle of influence in the five years that preceded the war. Almost all fair grounds of importance were taken over by the military.

Despite problems incident to reconditioning of these grounds, most of the major state fairs were again held in 1946 after an average lapse of four years. By comparison with the quality and number of livestock displays that distinguished these shows in the five years prior to war, the exhibits in 1946—particularly of livestock—were under par. This was attributed to high prices of feed, scarcity of farm labour, and the long time required to prepare animals for show. Most of these shows revived on short notice.

The New York state fair, one of the east's largest, and the Kentucky state fair, outstanding for its prewar saddle horse shows, were among the few state fairs that did not reopen in 1946. The Minnesota state fair, noted in prewar times as the largest farm machinery show in the country, was scheduled to reopen in 1946 during the last week of August; but it was cancelled at the last minute because of an unusually severe epidemic of infantile paralysis.

The U.S. leading livestock show for four decades prior to World War II was the International Live Stock Exposition and Horse show in Chicago, Ill. Founded in 1900, it progressed and grew in size and significance each year until 1914 and 1915, when a national epidemic of hoof and mouth disease forced its cancellation. Returning in 1917 on a larger scale than before, the International went on each year through 1941, when it closed at midnight on Dec. 6, a few hours before the attack on Pearl Harbor. Not even the Chicago stock yard fire of May 19, 1934, which destroyed all the show buildings that had housed the International, caused its interruption. The new International amphitheatre was built in less than five months and was ready for the 1934 exposition to go on as scheduled.

Meeting in the spring of 1942, the International's board of directors voted to cancel the exposition for the duration of the war in compliance with the request—just issued—of the Office of Defense Transportation that all such shows be curtailed. The signal corps of the army took over the International amphitheatre soon after, and it was occupied by them until Aug. 1, 1946.

Four substitute shows, known as the Chicago Market Fat Stock shows, were held during the first week of December under sponsorship of the Union Stock Yard and Transit company, operators of the Chicago market. Consisting only of the classes for fat cattle—steers, lambs and hogs, shown individually and in carlots—which had formerly made up a major part of the full International Live Stock exposition, there was no added burden to transportation. Exhibits consisted only of animals that would have moved to market anyway, and they served the purpose of sustaining much of the spirit and purpose of the International during the war period. The shows were held in the pens, buildings and sheds of the market place.

The average entry of livestock at the International show for the five year period from 1937 through 1941 was 12,304 animals; the peak year was 1939, with an entry of 13,332. During the wartime market shows, from 1942 through 1945, an average of 5,500 animals were shown each year—the largest series of straight fat stock shows put on in the United States during the war period.

Immediately prior to the 1945 show, the International secured permission from the Office of Price Administration to sell all the animals that had qualified for show purposes above the ceiling prices on all slaughter animals. The action resulted in several record prices. The grand champion steer brought \$10 a pound, the grand champion calload of 15 fat steers \$2 a pound, or \$30,660 for the load, the grand champion wether \$3 a pound, and the grand champion barrow \$7 a pound.

The "Victory" International Live Stock Exposition and Horse show reopened in the International amphitheatre Nov. 30 through Dec. 7, 1946. Attendance for the week exceeded all past records. The gate was close to 500,000. Visitors came from every state in the union and Canada. Exhibits totalling 10,490 animals, were sent to the show by breeders, feeders, horsemen and farm youths from 35 states and Canada. The value of livestock exhibited was approximately \$15,000.000.

The International Junior Live Stock Feeding contest survived the war and the participation of farm boys and girls from 13 states at the 1946 International was 113% greater in terms of the number of animals shown than it was at the last prewar exposition in 1941.

National contests featured at the "Victory" exposition in 1946 were a collegiate livestock judging contest; a junior livestock judging contest, in which state-champion teams of boys of high school age matched their skill in livestock judging in competition for the national title; a collegiate meats judging contest; and the International Grain and Hay show—world's largest competitive farm crops show.

One of the great specialty shows of the United States in prewar years, the National Dairy show, did not survive World War II. Founded at Chicago in 1906, it was held annually in the same setting occupied by the International® Live Stock exposition until 1920, when it became an itinerant show. It was last held in Oct. 1941 at Memphis, Tenn. The closest approach to a national show for the dairy interests thereafter was the Dairy Cattle Congress and National Belgian Horse show at Waterloo, Iowa. Forced into suspension for three years of the war, from 1943 through 1945, the congress was reopened in 1946. Despite the inroads of tractors into the draught horse business as a means of farm power, the exhibit of Belgians at Waterloo in 1946 was larger than it was in 1942. Another breed of draught horse staging a strong postwar come back in 1946 was the Percheron. The national show of this breed was held that year in connection with the Indiana state fair at Indianapolis and drew more entries than at the last prewar national show in 1942 at the Minnesota state fair, St. Paul.

The Eastern States exposition—one of the strongest shows of the east from 1937 through 1941, with particular emphasis on dairy breeds, remained a war casualty in 1946.

In Canada, the only show to survive the war years was the Calgary Exhibition and Stampede—a July event that attracted a huge attendance not only from the dominion but from the western United States as well. In 1946, three other Canadian summer shows were restored. These were the Edmonton exhibition, the Saskatoon exhibition, and the Regina Provincial exhibition—all held in July of that year. Another Canadian show returned to the September calendar in the Exposition Provinciale at Quebec; and the Royal Winter fair at Toronto—after a wartime interval of seven years—returned in Nov. 1946, the 25th anniversary year of this event. It was Canada's leading livestock show in 1946. The Canadian National exposition, founded in 1879 at Toronto, was not held after 1940.

Seven years had elapsed since the last of Great Britain's

oldest and longest established livestock shows—the Highland Show of Scotland, and the Royal Agricultural show of England. The Highland celebrated its 108th anniversary in 1939 and the Royal was 98 years old the same year. Neither was revived in 1946. The only show of importance in Great Britain to survive the war period was the annual Perth Show and Sale in Scotland. It featured Shorthorn and Aberdeen-Angus cattle. A world record price for a Shorthorn bull was established at the 1946 Perth show when the champion Shorthorn bull was purchased by a U.S. buyer for 14,500 guineas, or \$68,000 by the time of delivery in the United States.

South America's largest show, the Palermo, held annually in August at Buenos Aires, continued without cessation during World War II. It became noted as the world's largest show of Shorthorn cattle. An international exhibition every fifth year, it normally had drawn exhibits from other South American countries and from Great Britain; but because of war conditions and the difficulty of shipping, exhibits at the 1943 international of the Palermo were confined to those from the Argentine and Uruguay. This show also featured Hereford and Angus cattle as well as Holsteins and Guernseys, the two principal dairy breeds of the Argentine. (W. E. O.)

Dogs.—The U.S. canine population increased from around 12,000,000 to 13,000,000 (by estimated figure, in the absence of official statistics, state or federal) during the decade 1937–46.

In 1937 the three largest dog shows, based on number of dogs actually competing, were: Morris and Essex (outdoors at Madison, N.J., discontinued 1942 through 1945, re-

Champion for the second successive year, "My Own Brucie," a black cocker spaniel, was selected from among 2,547 entries of all breeds in the Westminster Kennel club show in New York city Feb. 12, 1941

sumed 1946), 3,500; Westminster (or Garden show), New York city, 2,753; Cleveland, Ohio, 1,300.

Morris and Essex held this lead through 1941, reaching a top in 1939 with 3,862 dogs, the United States' largest alltime show (and edging ahead of Crift's of London, which had held that distinction). Westminster held second through 1941 and then took top place 1942 through 1946 with Morris and Essex second in 1946; Long Beach, Calif., third.

Katonah, N.Y. (discontinued after 1946) was third in 1939 through 1941 with its highest in 1940–1,792 dogs; it was second in 1942 and 1943. Chicago, Ill., discontinued in wartime after 1942 (1,334 dogs), was resumed in 1946, placing fourth.

In 1946 the American Kennel club registered approximately 196,000 dogs, an all-time high, comparing with 84,525 in 1937 (to that date the highest total); 1941 saw a new high, 88,000. The coming of World War II, contrary to fears at the time, did not retard activity in the dog field, since 1942 had 89,100 registrations. This fell to 77,400 in 1944.

An outstanding aspect was that the merry little cocker spaniel led the 112 breeds every year from 1937 through 1946, more than doubling in the latter year its 1937 total of 15,110.

The Boston terrier kept second place for three years, a high of 9,400 in 1937 and in 1940 yielded to the little beagle, which maintained it steadily with an average of 8,000. The Scottish terrier held third in 1937 with 7,700 but went down to sixth as the decade closed in 1946. The fox terrier held between fourth and fifth place, while a wartime surprise was the dachshund, creeping up to fifth place in 1943 with 2,779. The Pekingese held the top billing among the toy dogs, capturing fourth place in 1944 with 2,726, when the collie took fith.

The world's largest dog, the Saint Bernard Yocub, weighing 247 lb., died in 1938. New breeds admitted to the registry—the barkless African dog, the basenji (as hound); the gray German pointer Weimaraner; and two U.S.-developed breeds, the American water spaniel and the black-and-tan coon hound. The last applicant of the decade was the Irish wheaten terrier, partially recognized.

The smallest dog exhibited was an eight weeks old chihuahua (smallest of all breeds, one lb. up matured, a native Mexican breed), at a match of the Kennel Club of New Jersey, Feb. 23, 1940. (W. Ju.)

Horses.—Public interest in the horse as a show animal was growing steadily at the beginning of the decade 1937–46. While the number of work horses was declining steadily, the popularity of the light horse for riding and racing was demonstrated by the holding of horse shows in connection with county fairs; local riding and hunt clubs; and with all types of livestock exhibitions. Attendance at these shows was positive evidence of the favour of the general public. Estimates placed the total of all types of shows at about 1,000. The American Horse Shows association reported 174 shows in 1938 recognized under its supervision; 187 in 1939; 162 in 1940; and 171 in 1941.

World War II checked the expansion of horse exhibitions, and by 1942 most of the larger annual exhibitions had been cancelled entirely or reduced to very local competitions. Most of the state fairs were closed, and hundreds of small community shows were omitted. Many of the state fairs and other large exhibitions gave up their buildings for military uses as camps or storehouses. Restrictions were put on shipments of horses for show purposes by rail or

truck. With general travel restricted, the attendance was comparatively small at such shows as were held.

Important developments under way before the war recess were the growing international competitions of jumping teams. The United States and South American countries were taking a more active place in such competitions; a United States team also competed in London in 1937. A team from Chile won first place at the National Horse show at New York city in Nov. 1938.

Light-gaited horses were popular, and the new walking horse, developed in Tennessee, appeared at several shows. Heavy draught horses, although declining in numbers, were shown at most of the larger horse shows as well as at the general livestock shows.

By 1944 the revival of the shows began, and some new ones were projected. The National Horse show, New York city, was a small exhibition chiefly for juniors. The new Chicago Horse show was held in Dec. 1944 with more than 1,500 entries in 125 classes and was such a success that plans were expanded. At the second Chicago show in 1945, the 1,705 entries in 125 classes attracted 588 animals. In 1945 the American Horse Shows association reported 108 shows held under its auspices, as compared with 62 in 1944. While the former leading shows in the east continued to be restricted, several important exhibitions were held in the west and south, notably at the Kentucky state fair at Churchill Downs; Spokane, Wash.; Los Angeles, Calif.; and Memphis, Tenn.

The state fairs listed more entries for heavy horses as they resumed their normal exhibitions.

In 1946 the National Horse show, New York city, staged a successful revival with a record for entries and attendance. The third Chicago show exceeded the two preceding exhibitions. Kansas City, Mo., St. Louis, Mo., San Francisco, Calif., Portland, Ore., Houston, Tex., and the state fairs all expanded their exhibitions. The revival of the community show of saddle horses and children's ponies was also evident. (J. C. Ms.)

Shvernik, Nikolai Mikhailovich

Shvernik (1888-), soviet statesman, was the son of a St. Petersburg worker. At the age of 14, he became a turner's apprentice in an electrical machine plant. Three years later he joined a revolutionary party and was active in agitating among factory workers. He joined the Bolsheviks and at the outbreak of the Russian Revolution in 1917 was elected chairman of the All-Russian Union of Ordnance Workers. During the civil war, he enlisted in a guerrilla detachment and later held command posts in the new Red army. Returning to trade union work in 1921, he was elected chairman of the metal workers' regional committee in the Donbas; two years later, he was appointed people's commissar of Workers and Peasants Inspection. In 1930 he was elected to head the entire trade union movement in the U.S.S.R. as first secretary of the Central Council of Soviet Trade Unions. He was also chairman of the Council of Nationalities of the supreme soviet, and during World War II was named chairman of the Extraordinary commission investigating axis crimes in the soviet union. Shvernik also became a member of the central committee of the Communist party in the U.S.S.R.

Upon the retirement of President Mikhail Kalinin, who died shortly thereafter, Shvernik's appointment as his successor to the post of chairman of the praesidium of the supreme soviet was announced March 19, 1946.

Siam (Thailand)

A constitutional monarchy, Siam is situated in southeast Asia, bordered by Burma on the north and west, French Indo-China on the north and east and the Malay peninsula on the south. Area: 198,247 sq.mi.; pop. (1937 census): 14,464,489 including c. 500,000 Chinese, c. 500,000 Indian and Malayan, 60,000 Cambodian and Annamese and 2,000 Europeans; (est. March 1940) 15,717,000. Chief towns (1937 census): Bangkok (cap., 681,214); Chiengmai (544,001); Khonkaen (473,475); Chiengrai (443,476). Language: Siamese. Religion (1937): Buddhists 13,752,091; Mohammedans 626,907; Christians 69,227; others 15,880. Rulers: King Ananda Mahidol, succeeded to the throne on March 2, 1935; reputedly assassinated on June 9, 1946, hc was succeeded by his brother Prince Phumiphon Aduldet. Prime ministers: Colonel Phya Phahol Pholphayuha Sena (1935-Dec. 15, 1938); Field Marshal Luang Pibul Songgram (Dec. 15, 1938-July 29, 1944); Major Kuang Kovit Aphaiwong (Aug. 2, 1944-Aug. 17, 1945); Seni Pramoj (Sept. 19, 1945-Jan. 31, 1946); Kuang Kovit Aphaiwong (Jan. 31, 1946-Aug. 21, 1946); Thawan Thamrong Nawasawat (after Aug. 23, 1946).

"Land of the Free."-In June 1939 the Siamese government announced that henceforth its country would be known as Thailand ("Land of the Free"), and this became the keynote to Siamese policy in the years 1937-41, when Siam was emerging as an independent and nationalistic state. In the words of its foreign minister, it had suddenly grown up and become a modern nation, and in the context in which it was used this was no overstatement. In 1936 Siam denounced all its existing treaties and in 1937 signed revised ones with Great Britain, the United States, Japan, Switzerland, France, Belgium, Sweden, Denmark, Norway, Italy, Germany and the Netherlands. These new treaties brought to an end the system of extraterritoriality and gave Siam unrestricted jurisdiction over its own territory, at the same time placing its trade relations with the outside world on a basis of complete equality. The government's economic policy was to foster rice production and existing industries for the greater benefit of the Siamese producer and to develop the country's land, water and air communications to facilitate the exploitation of its natural wealth. In the social field the government laid stress on vocational training and the inculcation of the savings habit among the people. Considerable progress was made in the establishment of a co-operative credit movement.

The government's policy was challenged in Sept. 1938 when an elected member of the Siamese parliament demanded a detailed account of expenditure. Although coopted members supported the demand, the prime minister refused to supply the information; parliament was dissolved and a general election was held on Nov. 12–15. The cabinet was reconstructed, and Field Marshal Luang Pibul Songgram, leader of the militarist-nationalist movement, was appointed prime minister, combining that office with the ministries of defense and the interior. Shortly before he took office an attempt was made on his life, and in Jan. 1939 a plot was revealed to dethrone the king and restore his uncle, ex-king Prajadhipok.

During the years 1937-39 Siam had embarked on a rearmament program; this, backed by the fact that Japan was spending large sums in Siam, was interpreted by many foreign observers as the development of a sinister friend-ship between the two countries. At the same time those who knew Siam well were convinced that the strongly nationalistic sentiment and independent nature of the Siamese made this unlikely; there was certainly no evidence

of anti-European feeling among Stamese in responsible positions. On his appointment Pibul announced a policy of strongly defended neutrality.

War with Vichy.-On the outbreak of war in Europe in Sept. 1939 Siam proclaimed its neutrality and in June 1940 signed nonaggression pacts with Great Britain, France and Japan. The pact with France, however, remained unratified, and on Sept. 6 Siam opened diplomatic negotiations with the Vichy government for rectification of the frontier with French Indo-China in the Savannakhet region, cession of parts of western Laos, retrocession of Battamberg and Siem-Reap provinces and an assurance that if Japan seemed likely to force French withdrawal from Indo China the entire states of Laos and Cambodia should be ceded. These demands, historically justifiable, if opportunist, were rejected by Vichy; they were repeated and again rejected. On Oct. 18 popular demonstrations for the use of force were made in Siam and French and Siamese troops began massing at the frontier. On Nov. 23 Siamese troops were reported to have crossed the border and fighting began. Border warfare continued throughout December but on Jan. 23, 1941, a Japanese offer of mediation was accepted by the French, and hostilities ceased five days later. At the peace conserence which opened in Tokyo on Feb. 7, Japan proposed a much larger cession of French territory than Siam had originally demanded and, by the terms of the treaty signed on May 9, France ceded the districts of Paklay and Bassac and the larger part of Cambodia; Siam agreed to pay France 6,000,000 piastres in six annual instalments. In two protocols to the agreement, France and Siam agreed that any future dispute should be mediated by Japan.

Japanese Occupation.-Japan's declaration of war on Great Britain and the United States emphasized Siam's position as a buffer state between two great powers and made its oft-repeated policy of independent neutrality untenable. In Nov. 1941 the premier was given absolute authority for a period of 12 months and defense preparations were made. The official radio meanwhile tried to calm the fears of the Siamese that their country would become a battleground for the British and Japanese. By Dec. 5 the Japanese had long-range bombers and 60,000 troops in Indo-China. On Dec. 9 Japanese troops entered Siam and met with practically no resistance; on Dec. 21, 1941, a ten-year treaty of alliance was signed at Bangkok. Siam declared war on Great Britain and the United States on Jan. 25, 1942, and soon afterward recognized the puppet Wang Ching-wei regime in China. Riots followed the declaration of war and were again reported in August, but the only effect of any effort to assert independence was an increase of Japanese control. In Oct. 1942 the powers of the national assembly were transferred to Pibul's puppet government for the duration.

Economically Siam was now thrown on its own resources, which were in any case being steadily milked by the Japanese. The currency was drastically devalued in terms of yen, which made the worth of the Japanese loan of 200,000,000 yen, negotiated in June 1942, more apparent than real. The strategic value of Siam to the Japanese in the Burma campaign was increased by the building of the Siam "railway of death" as it came to be known, connecting southern Siam with Burma. This railway was begun by the Japanese in Nov. 1942 and completed in Sept. 1943, and is said to have cost the lives of some 16,000 Allied prisoners and more than 150,000 Asiatics. (It was announced in Oct. 1946 that the Siamese government was to buy for £1,250,000 that part of the Burma-Siam railway built with prisoner-of-war labour.)

Siamese troops proclaimed a victory in the Shan states

King Phumiphon Aduldet of Siam (wearing glasses), who succeeded to the throne under a regency council in 1946. He is shown approaching the throne room at the palace in Bangkok to attend funeral services for his brother, King Ananda Mahidol, who died of a bullet wound on June 9

area of Burma in Jan. 1943, and the two Shan states and the four northern Malay states of Perlis, Kedah, Kelantan and Trengganu were formally transferred by the Japanese to Siam on July 5, 1943. These transfers were not recognized by the British government or regarded by it as permanent. Territorial gains were accompanied by a tightening of the Japanese grip and an increasingly totalitarian regime. For instance, betel-chewing, a universal habit among the Siamese, was banned; innumerable irksome governmental orders were made. Prime Minister Pıbul was now openly called a quisling, and in July 1944 he and his government resigned, to be succeeded on Aug. 2 by Major Kuang Aphaiwong, one of the original supporters of the democratic revolution. Under the leadership of Aphaiwong and the Regent Pridi Panomyong, better known to the world as Luang Pradit, Siam now pursued a policy of nonco-operation with the Japanese, while the resistance movement sponsored by the Allied Southeast Asia Command, though never given the chance to prove itself openly, gave considerable help to the Allies.1

¹The Times of London in an account published on Dec. 22, 1945, was the first to tell the true story of the part played during the war by Pridi Panomyong. Lord Mountbatten of Burma, former supreme Allied commander, Southeast Asia Command, speaking in London on Dec 17, 1946, elaborated in detail the account of The Times He disclosed many details about the "funique relationship" of an Allied supreme commander exchanging vital military plans with the head of a state technically at war with the United Nations.

Peace with Britain.-On Aug. 16, 1945, Siam repudiated its declaration of war on Great Britain and the United States, but the repudiation was rejected by Britain as unconstitutional. After prolonged discussion and consultation with the United States a peace treaty was signed between Great Britain and India and Siam (after Sept. 7, 1945, officially known as Siam once more) on Jan. 1, 1946. Under its terms Siam agreed to return all acquisitions of British territory, to provide 1,500,000 tons of rice for Asia, to take part in regional security arrangements in southeast Asia under the provisions of the United Nations charter and to undertake that no canal linking the Gulf of Siam with the Indian ocean would be cut across Siamese territory without the prior concurrence of the British government. Agreement was also reached on future economic collaboration, Siam undertaking to observe the treaty of commerce of 1937 pending the signature of a new commercial treaty, and agreeing not to exclude British commercial or industrial interests from participation in Siam's economy and trade "on grounds of nationality." It also agreed to participate in any general international arrangement regarding tin or rubber, to prohibit exports except under the direction of the Combined Boards and to regulate trade and stimulate production of rice, tin, rubber and tea. Siam was slow in producing the agreed quota of rice in 1946, partly because of the difficulties of transporting it from the interior, partly because it now represented the country's only asset. Inducements made by the Siamese government to merchants did, however, speed up deliveries.

French Dispute.-Disturbances on the Indo-Chinese border added to Siam's postwar difficulties. The French government did not recognize the cession of territory by Vichy, and in the early months of 1946, efforts were made to arrange a conference which would formally end the state of war between France and Siam and restore the disputed territory. The situation was complicated by the presence of armed bands of refugee Annamites hostile to France on the Siam side of the border, and the fact that French frontier police were constantly crossing the frontier in pursuit of guerrilla troops. On May 24 the Siamese government reported that about 800 French troops had crossed the Mekong, and on June 1 made a formal protest to the United Nations against French activities, appealed for sympathy and assistance and at the same time asked for admission to membership of the United Nations. On the same day the French government requested the United States and Great Britain to draw the attention of the Siamese government to the fact that Siam had not yet returned the territories of Laos and Cambodia acquired in 1941. On July 16 Siam asked that the situation be brought before the Security council as one threatening the maintenance of peace. So diverse were French and Siamese reports of the situation that it was generally felt that even if the threat to world peace was an exaggeration it would be well if the whole matter were ventilated in the Security council. Siam, however, requested a postponement of the discussion, and negotiations instituted by France on Aug. 1 for bringing the case before the International Court of Justice were also broken off. On Oct. 15 the Siamese parliament, after heated debate, endorsed the government's

1940

decision to return disputed territory (nearly 44,000 sq.mi. in extent) to Indo-China. A Franco-Siamese agreement providing for the return was signed at Washington on Nov. 17. 1946; diplomatic relations were restored; Siam withdrew its complaint to the Security council and France its opposition to the admission of Siam to the United Nations.

King's Death.-On June 9, 1946, the young king Ananda Mahidol was found dead in his bedroom from a gunshot wound. An official statement issued by the Siamese legation in London said that his death could be presumed to be an accident "as a result of his Majesty having handled a gun according to the royal inclination and habit." A commission aided by a committee of 19 medical members was appointed to inquire into his death, and on July 2 an official police statement declared that 12 out of the 19 members reported that murder was the most likely explanation. Prince Phumiphon Adul-

Sikorski, Wladyslaw

Sikorski (1881-1943) Polish politician and army officer was born May 20, 1881, in Tyszowce Narodovy Austrian Galicia, and studied engineering at the Lwow University Technical college graduating in 1908 One of the leaders of the nationalist movement in Poland he was trained in the Austrian aimy, 1905-06, commanded a regiment of the Polish legions in World War I and fought in the Polish Russian conflict, 1920 After the assassina tion of Polish Pres H Narutowicz in Dec 1922, Gen. Sikorski, then chief of the general staff, was made premier and interior minister, remaining in office until Dec 1923. He served as war minister, 1924–25, then returned to army service as commander of the Lwow military area His dismissal from the army in 1928 was only one of the many personal changes effected by Marshal Joseph Pılsudskı in the civil and army administrations after he took power Sikorski subsequently went to France, where he wrote extensively on political and military matters. At the out break of the war with Germany in Sept 1939, his request for an assignment to active service was refused. After the collapse of Poland, however he became premier of the Polish government in exile, in addition, he was made commander in chief of the Polish legions that fought on battlegrounds in France, Britain and the middle east Politically, he mended his fences with the Czechoslovak government in exile, but ran into a snag on the issue of relations with the USSR On June 23 1941, Gen Sikor ski secured an agreement with Moscow which invalidated the Soviet German pact partitioning Poland in 1939 But dissatisfied with the conduct of anti soviet elements within the Sikorski cabinet, the USSR ruptured diplomatic relations in April 1943 Sikorski's continued efforts to mend relations with the soviet union were interrupted by his death in a plane crash, July 4, 1943, while he was en route from Gibraltar to London

Silesia

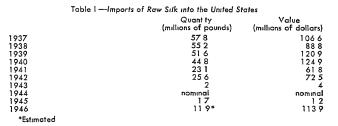

Of this former Prussian province, the eastern pait of Upper Silesia was ceded to Poland as a result of the plebiscite of June 15, 1922. It was organized as a province Slask, with an area of 1,633 sq mi and a population of 1,124,967 with the capital Katowice (Kattowitz), pop 134,000 (1939 est.) After the defeat of Germany in World War II, all the remaining parts of Prussian Silesia passed under Polish administration. This Polish acquisition consisted of the Upper Silesian district of Oppeln with an area of 3,750 sq mi and a population of 1,379,408, the Lower Silesian district of Liegnitz with an area of 5,257 sq mi and a population of 1,235,093, and the Lower Silesian district of Breslau with an area of 5,019 sq mi. and a population of 1,897,172

The province of Silesia included, in addition to great industrial wealth and natural resources, some of Gei many s principal towns like Breslau (1939 pop 615 006) Hindenburg (126 402) and Beuthen (100,644) In 1946 the German population was everywhere being replaced by Polish settlers Under Polish administration Silesia was divided into three provinces Lower Silesia with the cap ital at Wroclaw (Bieslau) Middle Silesia with the capital at Opole (Oppeln) and Upper Silesia with the capital at Katowice (Kattowitz) The German University of Bieslau (established 1702 and united in 1811 with the ancient University of Frankfurt on Oder founded 1506) was re opened as a Polish university in Breslau. A small part of the province of Silesia especially the territory around Kladsko (Glatz) and Ratibor (Raciborz) was claimed by Czechoslovakia (H Ko)

Silk

The last of the golden days of the silk industry coin cided almost exactly with the decade 1937–46. In those ten years the use of silk declined to the point of complete obliteration in 1941, when the Japanese embarked on a world war that meant severance of the last remaining ties between the world's largest silk producer and the world's largest silk consumer, the United States, and the cutting off of supplies to other silk consuming countries. At first the decline was not apparent to many students of silk con sumption, because the US hosiery industry was using an increasing amount and there was still a substantial use in Fiench, Italian British and US fine fabrics for women's underwear, men's neckwear and the high style dress fabrics of both France and the United States But the turn had come earlier In 1933, US fabric manufac turers had indicated to their Japanese suppliers that silk was no longer of substantial importance to them. The peak of silk consumption in the United States came in 1931 By 1937, the imports were the lowest since 1924 When the last normal trading year 1940 arrived imports were down to 1919 levels Except for silk used for war materials, and already stocked in the respective countries imports of raw silk were nominal until 1946, when US military authorities opened the sale of Japanese raw silk to the world through public sale by the United States Com mercial company, a government selling agency operating under the Reconstruction Finance corporation in Washington, DC

Biazilian Silk Bubble.—A slight flurry was caused in 1945 by imports from Brazil which saw in the elimination of Japan as well as China during World War II an opportunity to enter the supposedly lucrative US silk market Japanese workers on farms in southern Brazil, primarily around São Paulo, had long held ambitions to become a new source of supply, but the price of the reeled silk and

mill. Second, instability of price plus an artificially high price level reminded manufacturers of past losses caused by rapidly changing

the uncertainty of available supplies as well as quality of workmanship had prevented any buyer interest. As suppliers of a fibre unobtainable elsewhere in the world, however, Brazil found buyers for raw silk at \$15 a pound in 1943-45, but the quality was not equal to prewar standards and hosiery manufacturers found it impracticable. Its only use was in dress fabrics that were four times the price of prewar fabrics and of a quality that found much to be desired. The result was elimination of the Brazilian market, as far as United States imports were concerned, once the Japanese and Chinese silk reappeared in 1946. Brazil, however, was reported to be planning domestic manufacture of the fibre for export to other South American countries who found it difficult to buy sufficient tex-

tiles in a clothes-hungry world.

Consumers.—The sharp decrease in silk imports between 1940 and 1941 was due primarily to the introduction of nylon as a yarn for hosiery manufacture. The hosiery makers had been the best customers of the silk-producing countries since 1936, as shown in Table II.

In 1940, when the first nylon hosiery was accepted with much enthusiasm by U.S. women, hosiery manufacturers were using substantially all of the silk imported. By 1941 (during the last six months), 28% of the full-fashioned hosiery for women was nylon, and the writers for radio comedians throughout World War II found nylon hosiery a popular theme for indicating something more precious than gold to feminine listeners. The hosiery market, for this reason, was watched closely by potential suppliers of raw silk, when the Japanese and Chinese markets were again open in 1946. The response was not encouraging, and it was conceded that the silk hosiery field was lost to the synthetic fibres. During 1946, the prices of silk hosiery steadily declined on the retail market. The manufacturers observed this trend, and their purchases of raw silk fell to a minimum by the end of that year.

In reverse, it was the fabric manufacturer who showed the only interest in silk of the postwar era and that, too, was limited. But most merchandising analyses made during 1945 and 1946 as to the future possibilities of silk consumption agreed that the best opportunities lay in the manufacture of luxury type dress and underwear fabrics, as well as the specialty neckwear fabrics. Despite these indications, the dearth of buyers among fabric manufacturers resulted in estimates by Dec. 1946, that silk consumption in the United States would not exceed 10% of prewar imports; and that even the 10% would not be achieved immediately for reasons that were not based primarily on consumer demand.

Consumers were reported by retailers as interested in silk, but it was recommended that prices be decreased to reach any quantity market. Silk dresses in 1946 were selling at \$75 and more, compared with 1939-40 prices of \$25. Newspaper advertising gave prominence to silk garments but still the manufacturers using raw silk did not respond. The reasons were twofold. First, silk yarn could not be handled as easily as synthetic; it was not as uniform in size of thread as synthetics and did not run through the loom as easily. It required much more preparatory treatment before weaving, could not be used on the high-speed modern automatic looms and required much more manual labour than synthetics. In a time of labour shortages, a fibre with such handicaps was shoved aside in a weaving

market values and were in glaring contrast to the stability in price of rayon, the fibre which had become the chief source of supply to former silk manufacturers.

The Price Problem.—A comparison of price movements in the chief textile fibres during 1937–46 demonstrates the difference between synthetics and natural fibres, including silk (Table III).

Table III. —Prices of Textile Fibres and Yarns 1937-46

From 1936-41, the price of raw silk was largely determined by Japanese dealers who were believed to be closely controlled by their government. When representatives of the Japanese industry first approached their former major customers in 1933, the U.S. fabric manufacturers, regarding support of a program for publicizing silk, one of the chief complaints from the buyers had been the instability of price, which had become highlighted because of the relatively stable rayon prices even at that time. On the other hand, other advisers said that silk must be reinstated as a luxury fibre and therefore the price should not be as close to the rayon prices as current trends indicated. The result was that the price of silk rose slightly for three or four years, then dropped once more for a year, only to rise sharply just before World War II removed it from the scene. At the same time, rayon continued its even way. When silk reappeared, its price was far above the prewar levels. At the first sale on July 1, 1946, the weighted average of prices paid was \$9.72 per pound. At the second sale, the average was \$7.96 per pound. On Sept. 30, 1946, minimum prices for each grade were established ranging from \$6 to \$10.50 per pound. At these and subsequent sales, buyers represented the United States, Great Britain. Switzerland, Sweden, Mexico and South America.

Effect of Silk Decline on World Politics.-The fact that the silk market of the world fell apart during the same era in which war was again rampant in its most virulent form offered some interesting comparisons. The close interest of the Japanese government in raw silk prices was claimed to be tied up with policy concerning world diplomatic relationships. When silk prices declined rapidly during the early 30s, it was stated freely in the U.S. market that the Japanese government was subsidizing the Japanese silk merchants in order to build up cash returns and thus enable the government to buy the supplies it needed for gaining world prowess. Silk, constituting the largest single item exported, represented approximately 13% of the total value of exports during the period 1937-40. Observers pointed out that 1941, the year when Japan launched its ambitious plan for world power, was the year when it must have been finally convinced that its hold on world trade through raw silk was gone. This was the end of a ten-year period in which the United States had indicated its growing lack of interest in silk.

When the U.S. military government took stock of Ja-

pan's assets for world trade in the fall of 1945, first consideration was given to silk. In October, General Douglas MacArthur issued a directive ordering the Japanese government to furnish figures on stocks and estimated production in which he made clear that the silk industry would have to assume a considerable share of the responsibility for furnishing export commodities acceptable as payment for vital imports. Japanese stocks were estimated to be 46,000 bales, approximately four to six weeks' supply to the United States before 1941. At that time, it was estimated that the value was \$18,500,000, or approximately \$3 a pound. The first offering of Japanese silk under this plan was in July 1946, when 5,130 bales were offered for sale under sealed bids. During 1946, five more sales were conducted but with decreasing interest from users. At all sales, most of the silk went to dealers who hoped to supply the domestic trade as the yarn was needed. The minimum or "upset" prices also steadily declined, not without anxiety on the part of those responsible for carrying out General MacArthur's plan for Japan's financing.

By the end of 1946, there was serious discussion as to whether Japan could depend upon its silk trade for any substantial part of its support; whether it would be better to discard silk for other agricultural products. At the end of the decade, and the beginning of a new era for the Japanese people, the history of silk was one of a lost cause.

U.S. Silk Raising.—The appearance of new attempts to raise silk in the United States attained substantial publicity during 1942-46. Such attempts were fostered by promised high returns and the absence of customary imports. Congressional committees visited Japan, looking for a supposed superior type of mulberry tree that the Japanese used in order to attain their high production but the committees reported that the Japanese used the ordinary type of mulberry found throughout the United States. Local chambers of commerce vaunted the performance of their particular citizens who had achieved new ways of reducing the cost of breeding the silkworms, reeling the silk, etc. Farmers were invited to share in the potential profits by buying mulberry cuttings and silkworm eggs to rear the cocoons from which raw silk is obtained. For an additional sum, some of the promoters offered to sell wonder-working machines which would reduce the cost of reeling the silk, almost entirely a manual process. Esti-

mates of profits were based on published figures of consumption and imports for the period 1931-41 and at prices that were being currently quoted for Brazilian silk, \$12 a pound. But by the end of 1946, no reports had been published as to any commercial production of silk from those sources, and domestic users stated that they had no expectation of receiving any. (See also RAYON AND OTHER SYN-THETIC FIBRES; TEXTILE IN-DUSTRY.)

mercial Company, Washington, D.C., announcements of raw silk sales; Silk Journal & Rayon World (Mariches ter, England). (I.L. BL.)

Silver

In general, gold and silver continued to the closely associated in nature during the decade 1 937—46. and flew countries produced appreciable quantities of one unaccompanied by the other; silver usually took precedence in amount, but in a tew cases gold predominated, as with several of the African producers. The production of silver was so widely scattered, with so many producers of small amounts, that complete world production could not be determined. Producers of more than 1,000,000 oz. a year, as listed in Table I, accounted for about 95% of the world total, while much of the remainder was covered by the unknown soviet output.

World silver production, unlike that of gold, suffered a severe decline during the depression years of the early 1930s, caused mostly by the relatively larger amounts of silver recovered as a by-product from the base metals, and partly by declines in countries like Mexico, where silver output greatly outranked that of gold. By 1937, world poroduction had recovered to better than the prede pression level, only to meet another heavy cut in the recession of 1938, which extended into 1939. The 1940 total came black to the 1937 high, but subsequently war conditions began to show their effects, with successive reductions of output each year.

When gold production was officially restricted in the United States and Canada, silver was likewise affected. In addition, producers everywhere were hampered by shortages of labour, equipment and supplies, and by increasing costs. Total output had shrunk by one-third in 1944, with further declines in 1945.

United States.—After the recession of 1938, silver production in the United States recovered slowly and in 1 941 had not yet reached the 1937 level. In 1942 shortages of labour and equipment, coupled with governmental resurriction of gold production, began to take a heavy tol 1 on output, and by 1945 the accumulated losses from year to wear had reduced the year's total 59%, below that of 1941. Production (mine)	64,363 61,706 \$91,877 \$230,531	64,373 \$85,307	70,549 \$58,434	67,259 \$47,053	54,091 \$41,103	41,461 \$27,903	34,4 74 \$23,3 73	≅9,024 \$≅7,278	

after the gold limitation order was rescinded on July 1, 1945, production continued to decline, not reaching a minimum until Feb. 1946, when the month's mine output was 1,637,091 oz., a third lower than the average rate for 1945. By Oct. 1946, the monthly total had increased to 2,073,079 oz., and the total for the 10 months was 17,178,176 oz.; this figure was equivalent to an annual rate of 20,414,000 oz., well below that of 1945.

The war era of decreasing output was paralleled by decreased imports of foreign silver, while at the same time industrial uses of silver expanded at such a rate as to create a definite shortage of supply. Much of this shortage was met by the sale of metal from U.S. treasury stocks which had not yet been incorporated into the monetary system. In addition to these sales of free silver, the treasury loaned thousands of tons of its silver reserve to government-owned aluminum and magnesium plants for use in making bus bars to carry the heavy currents required, thus saving large amounts of copper, the supply of which was critically short at the time these plants were built. A considerable proportion of the loaned silver was returned to the treasury, and eventually all of it would be.

Canada.—Although there was a pronounced decline in silver production in Canada, output was maintained much better than in the United States. After reaching a peak in 1940, production declined only 9% in 1941 and 5% in 1942; war restrictions then became more pronounced, with declines of 16% in 1943 and 21% in 1944, tapering off to 9% in 1945. Altogether, the drop was 46% from the high of 1940. Postwar recovery brought an output of 12,778,218 oz. in 1946, 1% less than in 1945.

Mexico.—Except for occasional off years, Mexico had been the world's largest producer of silver for the preceding 50 years, though during much of the time the margin above the United States was not great. As in the United States, the recession of 1938 cut production heavily, with recovery so slow that the war peak of 1942 barely surpassed the 1937 level. Subsequent output declined but in 1945 was only 28% below the 1942 peak.

Other Countries.—Data were still incomplete from several countries where the producing areas had been involved in the fighting zones or had been subject to axis occupation, chiefly Germany, Yugoslavia, Burma and the Philippines. Other producers in this category were so small that their output did not greatly affect the world totals. (See also Mineral and Metal Production and Prices.)

Simeon II

King Simeon of Bulgaria (1937–) was born June 16, 1937. On Aug. 28, 1943, Simeon's father, King Boris, died under mysterious circumstances—it was variously reported that his death was due to a heart attack, poisoning or shooting—and six-year-old Simeon ascended the throne. In Sept. 1943, Prince Cyril, Boris' brother; Lt. Gen. Nikola Michov, former war minister; and Bogdan Philoff, former premier, formed a regency to rule Bulgaria in the king's name until Simeon reached his majority. All three of the regents were executed Feb. 1, 1945, as enemies of the regime and as collaborators with the Germans, and on Sept. 8, 1946, the Bulgarians voted the monarchy out of existence. Simeon and his mother, Queen Ioanna, left

Bulgaria on Sept. 17, 1946, and went into exile in Alexandria, Egypt.

Simovitch, Dushan

Simovitch (1882-), Yugoslav statesman and army officer, was born in Kragujevac, Serbia. A graduate of the military academy in Belgrade (1900), he entered the army with the rank of a lieutenant of artillery and was a major on the general staff during World War I. After the war, he was chief of staff (1919-27) of the 3rd and 4th Yugoslav armies and later took charge of the army's mechanized instruction schools in Sarajevo. In 1938 he was appointed commanding general of the Yugoslav air force. Gen. Simovitch engineered the coup in March 1941 which led to the overthrow of Premier Dragicha Cvetkovitch's pro-axis government which had signed a pact with Germany and Italy.

Simovitch became premier of the new pro-Allied government, which repudiated the pact, proclaimed the end of the regency and installed young Peter II as active monarch of Yugoslavia. Following Germany's crushing defeat of Yugoslav arms in April 1941, Simovitch fled with Peter to Jerusalem and then to London, where the Yugoslav government-in-exile was set up. In early 1942, Simovitch was replaced as prime minister of the government-in-exile by Slobodan Yovanovitch.

At the height of the rivalry between the exiled regime and the Tito movement, Simovitch came out with a judicious appeal (May 19, 1944) recommending that King Peter form a government composed of all parties, including representatives of the partisans. In the same speech, he swung away from the monarchy by praising Marshal Tito's fight against the axis. After the war, Simovitch returned to Yugoslavia. Testifying at the trial of Gen. Draja Mikhailovitch in Belgrade, he declared June 28, 1946, that the defendant, far from being pro-German, was pro-British.

Simpson, Mrs. Wallis

See WINDSOR, DUCHESS OF.

Simpson, William Hood

Simpson (1888—), U.S. army officer, was born May 19, 1888, at Weatherford, Tex. A graduate of the U.S. Military academy at West Point (1909), he served in the Philippines (1910–12), in the Mexican campaign (1916) and as a divisional chief of staff with the U.S. forces in France (1918–19). After studying at various army institutions, he became an instructor in military science and tactics, teaching at the Army War college, 1936–40. Following the outbreak of World War II, Simpson held several command posts. He was made commanding general of the 4th army on Sept. 28, 1943, and a lieutenant general the same month

In the early phase of the fighting in France in 1944, Gen. Simpson led the attack on German-held Brest. On Sept. 13, 1944, it was disclosed that he was in command of the 9th U.S. army on the western front. The following November the 9th army went into action as Gen. Dwight D. Eisenhower launched a general offensive on the western front. Simpson's 9th army was in the thick of the Ardennes battle, and participated in the cleanup of the Ruhr and the Rhineland in 1945.

Announcement of Simpson's presence in China in July 1945 lent weight to reports that the U.S. 9th army, the only force definitely scheduled for redeployment to the Pacific, might be shipped to that theatre, but the war ended before the 9th could get into action.

Sinclair, Sir Archibald

Sir Archibald Sinclair (1890-), British politician, was born Oct. 22, 1890, in London. He was educated at Eton and Sandhurst and joined the army in 1910, but later resigned to enter politics. Elected to commons in 1922 as Liberal member for Caithness and Sutherland, he was chief Liberal whip, 1930-31, and served as secretary of state for Scotland, 1931-32. After the party split over the issue of joining the Stanley Baldwin government, Sinclair became leader of the Independent Liberals. When Winston Churchill formed his wartime coalition cabinet in May 1940, he made Sir Archibald secretary of state for air. A year later, when the R.A.F. intensified its raids over Germany, the air minister warned the reich that it would be bombed "night after night until the German people, shattered and disillusioned, decide for the second time that war is not worth while." The R.A.F. more than kept the promise. After dissolution of the coalition wartime cabinet on May 23, 1945, Sir Archibald was not reappointed to his post as secretary of state for air, which passed on to the hands of Harold Macmillan.

See MALAYAN UNION.

Sinking (Chinese Turkestan)

Largest and most remote of the provinces of China, Sinkiang has an area of 705,769 sq.mi. and a population of 8,700,000.

From the days of legend, beyond the recall of written chronicles, the history of Sinkiang has swung in cycles of terrifying violence and seductive peace. In 1937 an evanescent quiet was settling over the oases of the desert land. The remnant bands of the Moslem uprising of the early 1930s were being finally liquidated, while in the capital, Tihwa, a Chinese governor, Sheng Shih-tsai, made firm his grip on power with the aid of the soviet union.

The alliance between Sheng Shih-tsai and the soviet union had been born of necessity four years before. Sheng, leader of the Chinese minority—5% of the province's population—had been isolated by a rebellion of the overwhelmingly Moslem majority. The central government of China, nominal suzerain of the province of Sinkiang, had been unable to succour him from disaster. The soviet union, immediately across the border in central Asia, had been alarmed itself by the Moslem uprising, which seemed to the soviets a menacing form of Japanese intrigue. When invited by Sheng to assist in crushing the uprising, the soviets moved to his rescue with troops, airpower and materials.

Having thoroughly crushed the uprising by 1937, Sheng proceeded to reorganize the social structure of the province under soviet tutelage. A broad policy of racial tolerance was made part of governmental principle. Improved seed strains and livestock were imported from the soviet union, while village schools were fostered till their number multiplied by 20 during the course of the decade. Taxes were slashed to a fraction of those that prevailed in China proper. Highways were laid down, hospitals established, the Moslem clergy sharply restricted in its activity.

The program of social reconstruction was paralleled by a political program of harshest regimentation. Government censors rigidly suppressed all independent expression of opinion, concentration camps of the cruelest sort were established for dissidents and the secret police of the provincial government won a reputation for spectacular ferocity that coursed from end to end of Asia.

The provincial government was bound by closest ties to the soviet union. A loan of 5,000,000 gold roubles stabilized the chaotic provincial currency, soviet troops garrisoned the town of Hami against attack from China proper while soviet advisers infiltrated key government bureaus. The oil resources of the province were opened in 1939 as a joint soviet-provincial enterprise. So close had relations become that by the summer of 1939, Gov. Sheng himself applied for permission to join the Communist party and was refused.

Soon after 1939 the emotional and political ties that had bound Sheng to the soviet union began to wither. By 1941 relations between Sheng and the U.S.S.R. were under great strain, and the compulsions that had brought them together no longer obtained. Sheng, on the one hand, no longer teared the Moslems who had been crushed, and the benefits he enjoyed from trade with the soviet ceased when the German invasion concentrated all soviet production on war. The soviet union, on the other hand, no longer needed Sheng as an ally on its flank, for it was now allied with the central government of China itself.

In the spring of 1942 the younger brother of Sheng Shihtsai was assassinated in the provincial capital. The Chinese communists charged that he was murdered by Sheng. Sheng claimed that the murder was committed by the communists. Whatever the truth of the matter, Sheng made the incident pretext for a complete breach with the soviet union. He invited the Chinese central government to reenter the province, which it did, and by the fall of 1943 soviet influence had apparently vanished.

In the summer of 1944 native discontent again made itself manifest, breaking out in a revolt against the Chinese authorities in the Ili valley. The central government of China deposed Sheng, brought him to Chungking and attempted to placate the rebels by political concessions. In 1946 the Chinese government was still engaged in the political pacification of the turbulent Moslems, but dispatches from the interior of Asia gave little indication of what success was being achieved. (T. H. WE.)

Sjahrir, Sutan

Sjahrir (1910?), Indonesian statesman and politician, joined the Indonesian Socialist party and refused to collaborate with the Japanese during their occupation of the Netherlands Indies, 1942–45. His anti-Japanese stand made him more acceptable than Soekarno (q.v.) to the British and Dutch when the latter returned to the East Indies after Japan's surrender in 1945. Thus, in Nov. 1945, at the height of the Indonesian revolt. Sjahrir became premier. He overhauled the cabinet, assuming the portfolios of foreign minister and home minister for himself and

ousted from office all but one of Soekarno's cabinet appointees.

Sjahrir resigned in late Feb. 1946 over a dispute with opposition members who wanted him to form a more representative cabinet, but winning a vote of confidence in the national committee, he was renamed premier on March 2, and formed a new government, March 12. On June 29, it was disclosed that Sjahrir and five members of his cabinet had been kidnapped by an armed band. Sjahrir was released July 1 and he later disclosed that he had been kidnapped by troops of his army who thought he was a Dutch spy. When they finally realized that they had abducted their own premier, they were "dismayed" and released him promptly. The explanations were not taken at face value by some foreign observers in Batavia, who asserted that the kidnapping was staged by Soekarno, who wanted to assume dictatorial power for himself.

After nearly a year of fighting between Indonesian and Dutch forces, Sjahrir and Netherlands officials signed a truce Oct. 14, and the following month (Nov. 15, 1946) Sjahrir initialed a drast plan under which the Netherlands agreed to recognize the Indonesian republic and the latter's claims for equality and freedom.

Skating

See ICE SKATING.

Skiing

Of all sports, skiing was perhaps hardest hit by World War II, but it quickly regained its growing popularity in 1946 and promised to reach major status, both among spectators and participants. The ski-train industry, which transported thousands of city folk to snow resorts each winter week end, was eliminated by the transportation problems created by World War II, but started anew in 1946. Proof of the war's effect on skiing came in the 1942 and 1943 Bear mountain jumping classics. In 1942 the event attracted 19.500 fans; in 1943 the war held the crowd to a mere 1,500.

Competitive skiing in the United States was largely dominated by Richard Durrance of Dartmouth college, Alf Engen of Salt Lake City, Utah and Sun Valley, Ida., Arthur Devlin of Syracuse university, the Ruud brothers, Sigmund and Birger, and Torger Tokle, the latter three of Norway. Women's competition was dominated by the Sun Valley duo of Shirley McDonald and Mrs. Gretchen Fraser.

The world jumping record was established in 1938 by Joseph Brandl of Austria, who leaped 350.96 ft. at Planica, Yugoslavia. The U.S. record was extended on seven different occasions during the ten-year period, starting with Engen's jump of 242 ft. in 1937 and climaxed by Tokle's leap of 289 ft. at Iron Mountain, Mich., in 1942.

In 1937 the Ruuds dominated ski jumping, Sigmund winning the National title and Birger capturing the world championship. Sigmund Ruud's victory in the national was not declared until July 31, the committee having previously announced Alf Engen of Sun Valley as the victor. Richard Durrance, the Dartmouth university star, won both the national amateur and national open slalom titles, as well as the national downhill event. Emile Allais of France won the world's downhill championship.

In 1938 Birger Ruud topped United States skiers with a jump of 216 ft. to win the national championship at Brattleboro, Vt. Ulrich Beutter of Germany won both the national downhill and combined championships, while

Sgt. Torger Tokle won the first half of a novel tournament staged at Wrigley field, Chicago, Ill., in Jan. 1944

Dick Durrance of Dartmouth university won the National Intercollegiate. The world jumping title went to Asbjorn Ruud of Norway with 226.4 points.

Durrance led U.S. ski competition in 1939 by winning the open and amateur championships in the downhill, slalom and combined. Both Engen and Bob Roecker, of Duluth, Minn., broke the national ski-jumping records, Engen soaring 251 ft. at Big Pines, Calıf., and Roecker going 257 ft. at Ironwood, Mich. Helmut Lantschner of Germany won the world's downhill title, while Stanislaw Narusarz of Poland won the world jumping crown with distances of 241 ft. 1446 in. and 234 ft. 65764 in.

Engen won the American Ski trophy as the nation's outstanding skier of 1940 on the strength of his victory in the National ski championship. He won the title with leaps of 219 and 217 ft.

Durrance repeated as champion in the slalom and downhill combined.

During 1941, Tokle took charge of U.S. ski jumping with the record leaps which brought him the national, central and eastern titles. He twice broke the national jumping record, once with a leap of 273 ft. at Leavenworth, Wash., and again with a distance of 288 ft. at Olympian Hill, near Seattle, Wash. Toni Matt won the national open downhill and combined titles. Bill Redlin of the University of Washington won the amateur downhill, slalom and combined.

Ola Aangesen, a member of the royal Norwegian air force stationed in Canada, won the national ski-jumping championship in 1942 with jumps of 191 and 180 ft. Aangesen dethroned Tokle, who in turn set a U.S. distance record of 289 ft. at Iron Mountain, Mich. Engen won the U.S. open downhill-slalom combined title, while Barney McLean of Denver, Colo., swept the amateur events.

All U.S. ski championships were called off in 1943 because of the war. Arthur Devlin featured the limited competitive jumping. The University of New Hampshire topped collegiate skiing by winning the 34th Dartmouth Outing club carnival and the Senior Intercollegiate Ski union championship.

Featuring the war-restricted season, the Norge Ski club staged a novel ski jumping tournament in 1944 at Wrigley field, home of the Chicago National League baseball club. Sgt. Tokle of Camp Hale, Colo., and Lieut. Walter Bietila of the U.S. navy divided honours. In 1945 Merrill Barber of Brattleboro, Vt., won the only jumping test of importance, defeating Arthur Devlin in a Bear Mountain tournament.

In 1946 Alf Engen won the national open jumping title with a leap of 259 ft. Steve Knowlton of Aspen, Colo., won both the open and amateur downhill titles. Dick Movitz of Salt Lake City, Utah, won the national slalom, while Barney McLean of Denver, Colo., captured the combined championship.

Slate

Sales of slate in various forms in the United States were as follows during the period 1937-45, in short tons:

					1937	1939	1941	1943	1945
Roofing .					137.400	149,410	140,830	35.370	38,240
Mill stock .						21,710	18,680	15,950	11,520
Flagstones					8,620	8,480	21,480	21,990	19,900
Granules .					193,950	265,830	323,740	292,330	374,800
Flour	•				83,060	85,950	113,930	103,220	107,430
Total .					444,510	531,380	618,660	468,860	551,890

Total sales of all types of slate reached a high of 670,070 tons in 1929, but declined heavily during the depression years and had not yet regained its former high level in 1946. The construction program of World War II increased consumption heavily, to within 8% of the former high, but production declined to about the prewar level in 1943. There were marked improvements in 1944 and 1945, and the postwar building program was expected to bring further increases. (G. A. Ro.)

Slim, Sir William Joseph

Sir William Slim (1891–), British army officer, was born Aug. 6, 1891. He received a grammar school education in Birmingham and during World War I shipped as an officer of the Royal Warwickshires to France. Later he fought at Gallipoli, where he was severely wounded, and in Mesopotamia. Slim continued in the services after World War I, and in 1939 he was commandant of a senior officers' school in Bombay province. In World War II, he participated in fighting in Italy, east Africa and the middle east. Transferred to the Burma theatre, after Japan's entry into the war, he was made head of the 1st Burma corps in March 1942. In Oct. 1943 Slim was given command of the 14th British army which halted the Japanese drive into Manipur state, India, in June 1944. He then opened the arduous campaign to regain all of Burma and recaptured Mandalay in March 1945 and Rangoon in May. He relinquished command of the 14th army in Aug. 1945 to Gen. Miles C. Dempsey. Slim was made a knight of the Order of the British Empire on Jan. 1, 1946.

Slovakia 7

The eastern part of Czechoslovakia, as constituted in 1918, had an area of 18,895 sq.mi. and a pop. of 3,329,-793 (1930), of whom the great majority were Slovaks, a Slav people closely akin to the Czechs. Of the minorities there were 529,337 Magyars, 154,821 Germans, 95,359 Ruthenians and 72,678 Jews. Of the population, 78% were Catholic (of whom 72% were Roman Catholic), 17% Protestants and 4% Jews. Before 1918 Slovakia had been for almost 1,000 years a part of Hungary. In 1938 some Slovak territory was ceded to Hungary. The rest (an area of 14,848 sq.mi. with a pop. of 2,800,000) became an independent republic in March 1939. Capital, Bratislava; chief cities: Bratislava (123,852); Trnava (23,948); Nitra (21,283). The president was Msgr. Josef Tiso; premier, Dr. Bela Tuka. In 1945 Slovakia became an autonomous part of the reconstituted Czechoslovak republic.

Slovakia as an independent state came into existence in March 1939 through German help. On March 18, 1939, it signed a treaty with Germany for 25 years according to which German armed forces received the right to occupy Slovakia at any time and to erect military plants there. Slovakia pledged itself to conduct its foreign policy and to organize its army in agreement with Germany. All its economic life was co-ordinated with national socialist economy. On Nov. 24, 1940, Slovakia adhered officially to the Rome-Berlin-Tokyo military alliance. As a result of that pact, Slovakia participated in Germany's war against the soviet union after June 22, 1941, and declared itself to be in a state of war with the United States after Germany's similar declaration of wai Dec. 11, 1941. But many Slovaks, dissatisfied with the German vassalage, with the fascist trend and with the anti-Slav stand taken by the Slovak government, worked for the re-establishment of the Czechoslovak republic. A number of Slovaks participated in the Czechoslovak government which resided in England under Dr. Eduard Beneš as president.

During 1942 the nazification of Slovakia made rapid progress. On Oct. 22 the totalitarian character of the state was officially proclaimed. The Slovak People's party, a Catholic nationalist party founded by Father Andreus Hlinka (1864–1938), was recognized as the only party and its leader received the title vodca, the Slovak word for fuehrer. It comprised an armed militia, the Hlinka guards, and a youth organization, the Hlinka youth. Slovaks living abroad were to be organized as members in the same way as the German national socialists had built up their foreign organizations. The German anti-Semitic legislation was vigorously enforced in Slovakia.

In the summer of 1944 Slovak antifascist forces rose against the clerical fascist regime and succeeded quickly in seizing most of Slovakia's territory and in establishing a well-ordered administration with Baňská Bystrica as its centre. Most of the regular army and police forces of the government went over to the newly established regime. In this crisis President Tiso accepted the resignation of the cabinet of Dr. Bela Tuka and appointed his relative, Stephen Tiso, prime minister and also minister of foreign affairs and justice. The war minister and commander in chief, Gen. Ferdinand Čatloš, resigned from the Tiso government. On the other hand, the Slovak national council in Baňská Bystrica proclaimed the restoration of the Czechoslovak republic. Delegates of this council arrived on Oct. 13, by air, in London to establish direct relations

with the Czechoslovak government there, while the London government sent Gen. Rudolf Viest to assume command of the forces in Slovakia. In the liberated territory all totalitarian organizations were dissolved. Jews were liberated from concentration camps and their rights restored; state and church were separated. U.S., British and Russian liaison officers co-operated with Gen. Viest. Strong German armed forces were sent against the Slovaks, however, and after two months of bitter fighting the Germans succeeded in defeating the Czechoslovak army. The new German occupation was short-lived. By the end of the year Russian armies had penetrated into Slovakia from the east and from the north.

With the victorious advance of the Russian armies, the Tiso regime in Slovakia came to an end in 1945. By the end of the year, the country was under the Slovak national council, composed equally of communists and democrats. The council enjoyed a large autonomy in the domestic affairs of Slovakia. In the Czechoslovak government in Prague the Slovaks were represented by six members in the cabinet and by two of the five vice-premiers. In the Czechoslovak provisional national assembly the Slovaks had one-third of the deputies. These 100 Slovak delegates, half communists and half democrats, were elected in the city of Baňská Bystrica, on Aug. 29. The party which formerly ruled Slovakia, the Catholic People's party, was outlawed and its leaders were placed under arrest. The elections of May 1946 assured the victory of the Slovak Democrats with the Communist party taking the second place. (See also Carpatho-Ukraine; Czechoslovakia.)

Smigly-Rydz, Edward

), Polish army officer and Smigly-Rydz (1886– statesman, studied philosophy and painting in Cracow, where he met Josef Pilsudski. He fought against Russia on the Eastern Front in 1914-17, and again during the Polish campaign of 1919-20. He was inspector of the Polish army, 1922-35, and became one of Pilsudski's closest associates during this period. After Pilsudski's death in 1935, Smigly-Rydz became virtual dictator of Poland, assuming the post of inspector-general of the army. Prior to the German invasion in 1939, Marshal Smigly-Rydz was designated commander in chief of the army and successor to Pres. Ignacy Moscicki. Less than three weeks after the Germans invaded his homeland, he fled to Rumania, where he was interned. In Oct. 1940, he was arrested in Bucharest, following charges that the entire Polish embassy staff and many Polish refugees in Rumania were employed by the British to blow up the Ploesti oil wells. A Bucharest report (Dec. 20, 1940), said Smigly-Rydz, who had been held in the Dragoslav prison camp in Rumania, escaped from the camp to an unknown destination.

Smith, Alfred Emanuel

Smith (1873–1944), U.S. politician, was born Dec. 30, 1873, in New York city. Four times governor of New York state, Smith was Democratic candidate for president in 1928. In the 1936 and 1940 presidential elections he aban-

doned the party line and stumped for the Republican candidates. Although violently opposed to Pres. Roosevelt's policies during the peace years, Smith rallied behind the administration after the Pearl Harbor attack and called for national unity. An outstanding Catholic layman, Smith was appointed Knight of St. Gregory and papal chamberlain in 1938. He died in New York city, Oct. 4, 1944.

Smith, Holland McTyeire

Smith (1882-), U.S. marine corps officer, was born April 20, 1882, in Russell county, Ala. A graduate of the University of Alabama (1903) he practised law for a brief period and then joined the marine corps. Commissioned a second lieutenant in 1905, he was promoted through the grades to major general in 1941, and became commanding general of the Atlantic fleet's amphibious force the same year. Smith commanded U.S. amphibious forces during the battle for the Aleutians and in the invasion of Tarawa and Makin in 1943. He was also assault commander of operations in the Marshall Islands, Feb. 1944, and of landings on Saipan, June 1944. On Sept. 9, 1944, he disclosed that he had been "forced" to remove Maj. Gen. Ralph Smith, commander of an army division, during the Saipan battle. Although the marine general refused to discuss details, there were reports that the two Smiths disagreed on strategy, with the army commander refusing to accept the marine thesis of achieving quick victory without regard to immediate cost in casualties. Gen. Holland Smith, who was succeeded by Lt. Gen. Roy S. Geiger as commanding field officer of the marine corps on June 22, 1945, was made head of the marine training and replacement command at San Diego, Calif. On his retirement from the marine corps, Aug. 7, 1946, Smith was promoted to a full general.

Smith, Walter Bedell

Smith (1895—), U.S. army officer, was born Oct. 5, 1895, in Indianapolis, Ind. Shortly after the U.S. entry into World War I he entered the army direct from civilian life. After receiving his commission as a second lieutenant, he went overseas in April 1918, serving until Sept. and then returning to Washington, D.C., for duty in military intelligence. With the war department general staff after 1939, Smith was promoted to brigadier general in 1942 and was made U.S. secretary of the combined chiefs of staff. For his services in this post, he was awarded the distinguished service medal in 1943.

In Sept. 1942, as a major general, Smith became chief of staff in the European theatre, with headquarters in England, and subsequently chief of staff to Gen. Dwight D. Eisenhower in North Africa. He remained with Eisenhower throughout World War II and handled many details involved in preparation for the invasions of Sicily, Italy and Normandy. Promoted to the rank of temporary lieutenant general in Jan. 1943, he was made major general (permanent) in Oct. 1945. On Feb. 14, 1946, President Truman named Smith ambassador to the soviet union, succeeding W. Averell Harriman.

Smithsonian Institution

The year 1946 marked the 100th anniversary of the founding of the Smithsonian institution.¹ The centennial was observed by suitable ceremonies. A three-cent commemorative postage stamp was issued by the post office de-

¹The following bureaus of the government were administered by the Smithsonian during the decade 1937-46: *U.S. National museum, Bureau of American Ethnology,* National Collection of Fine Arts, Freer Gallery of Art, International Exchange Service, National Zoological Park and the Astrophysical observatory. The National Gallery of Art also became a Smithsonian bureau under a separate board of trustees.

partment, special publications were issued by the institution to mark the event and special exhibits were shown to illustrate the work of the institution during its first century.

Research and Exploration.—In 1941 Dr. Frank H. H. Roberts, Jr., concluded several years of work on the Folsom man problem, centering mainly on the Lindenmeier site in northern Colorado. There he unearthed numerous artifacts, including the distinctive Folsom projectile points, which indicated that the area had been a hunting ground for Folsom men at a time when animals now extinct roamed over Colorado. Geological studies at the site indicated an age for the artifact-bearing deposits of 10,000 to 25,000 years, with the geologists' preference leaning toward the higher figure.

In 1938 the Smithsonian participated in the presidential cruise to the Galápagos Islands, Dr. Waldo L. Schmitt accompanying the expedition as biologist. In 1939, in cooperation with the National Geographic society, there began a series of joint archaeological expeditions to Mexico, under the leadership of Dr. Matthew W. Stirling, chief of the Bureau of American Ethnology. These added measurably to knowledge of Mexican archaeology, establishing what became known as the La Venta culture. The same year marked the end of Dr. Aleš Hrdlička's anthropological field investigations in Alaska begun in 1926, in which he gathered many important specimens and much data relating to the origin of early man in America. Two expeditions were notable in bringing back live animals for the National Zoological park. The first, in 1937, to the East Indies, was conducted in co-operation with the National Geographic society, while the second, in 1940, to Liberia, was made possible by the Firestone Tire & Rubber Co., of Akron, O. Both were under the direction of Dr. W. M. Mann, director of the zoo, and both were eminently successful in the number and variety of animals obtained.

The staff of the Astrophysical observatory devoted several years to the revision of the daily solar radiation values recorded at the Smithsonian solar observing stations on Mt. Montezuma, Chile, Table mountain, Calif., and Mt. St. Katherine, Egypt, from 1923 to 1939. The final values were published in 1942 as vol. 6 of the Annals of the Astrophysical Observatory. They clearly indicated the variation of the sun ranging up to about 3%, with the variation shown to be composed of 14 periodicities ranging from 8 to 273 months. In 1938 the solar observation station at Mt. St. Katherine in Egypt was abandoned and a new one was established at a more accessible location on Burro mountain, near Tyrone, N.M.

The Division of Radiation and Organisms continued its work on photosynthesis. The importance of carbon-dioxide assimilation as a function of wave length of light was shown, and the spectrographic method of determining small amounts of carbon dioxide was further improved and utilized in the measurement of photosynthesis and respiration in plants. Emphasis was placed on the wavelength effects of light on plant growth and on growth substances found in plants. Development of instrumentation accompanied this specialized research.

Biological research and field work conducted under the Walter Rathbone Bacon travelling scholarship of the Smithsonian institution saw notable results. During the decade this scholarship was awarded to three recipients: Dr. Richard E. Blackwelder for studies of the staphylinid beetles of the West Indies; Dr. Hobart M. Smith for investigations relating to the herpetology of Mexico and Philip Hershkovitz for a study of the distribution of mammals in Colombia.

The coming of World War II suspended most of the research and exploration activities of the institution except those directly pertaining to the war effort.

In 1943 the Institute of Social Anthropology was added to the Smithsonian institution, operating as an autonomous unit of the Bureau of American Ethnology and receiving its funds through the department of state. The institute's stated purpose was to carry out co-operative training in anthropological teaching and research, with two objectives in mind: (1) to introduce modern social science theories and techniques to other countries so that they might train their scholars for such work and (2) to accumulate basic social science data about the rural populations in those countries. During the first three years of its organization, with Dr. Julian H. Steward, anthropologist, in charge, the institute operated chiefly in Mexico, Peru and Brazil.

War Work.—World War II was literally a war of science and during the war years the services of the Smithsonian were utilized to an unprecedented extent. Shortly after Pearl Harbor the secretary appointed a war committee to canvass the institution's possibilities and to recommend specific lines of action. As a result a large part of the effort of the staff was devoted to war work, and the Smithsonian became an essential cog in the great war machine in Washington, D.C.

Probably the Smithsonian's most effective contribution to the war was its ability to answer urgent calls from the U.S. army and navy for information in a variety of fieldsmainly anthropology, biology, geology, geography, physics and astrophysics, engineering, textiles and fibres and woods. Many of the requests were for information that had only an indirect war connection, but others led straight to the fighting fronts and had a direct bearing on the progress of the war. Among the latter were calls for means of identification of various kinds of disease-bearers such as mosquitoes, rats and molluscs; for reports on geography, peoples and other features of areas ahead of the actual fighting; for transliteration of Chinese, Japanese and Siamese names on maps of war areas; for preparation of a survival manual for aviators and other personnel stranded in unfamiliar areas and for many other items of equal importance.

As a means of bringing together in one place all the known resources of specialized and regional knowledge urgently needed by the army and navy, particularly in the early days of the war, the institution joined with the National Research council, the American Council of Learned Societies, and the Social Science Research council in setting up the Ethnogeographic board with offices in the Smithsonian building. The board proved almost immediately to fill a place among the Washington, D.C., war agencies. Besides making available to the army and navy a great regional file of specialists able to assist in the solution of problems relating to all parts of the world, the board produced on request numerous special reports on particular regions for use in planning military operations, and served as a clearinghouse for spot information in many different fields.

The facilities and staff of the Astrophysical observatory, including the Division of Radiation and Organisms, were occupied for a considerable time with research on the heatradiation properties of various textiles, pigments and other materials used for war purposes, and on the deterioration of impregnated cloth, cardboard and other materials used by the navy. A number of special instruments were development

oped and constructed for the navy At the request of the Office of Scientific Research and Development, an extended study was made to find a filter that would exclude unde sired types of radiation and transmit certain desired wave lengths

In geology one museum staff member was in the field continuously throughout the war directing an investigation for the US Geological survey of Mexico's resources of strategic minerals Another member was engaged in a study of the geological structure in an economic survey of the ore and mineral deposits of northern Mexico, and later investigated Devonian stratigraphy in Illinois in connection with oil resource studies. Much of the work in the field of biology was in the nature of continuous assistance to war agency personnel through identification of specimens, instruction in various fields of medical biology, training of military personnel in identification work, conferences on recognition and control of harmful organisms, reports on the occurrence and identification of strategic plant material and other similar activities. In anthropology staff members prepared a number of reports and articles involving research on the native peoples of various war areas at the request of army and navy intelligence officers Studies of arctic clothing were made for the army quartermaster corps, based on the extensive collections of Eskimo garments in the National museum For use in the design of oxygen and gas masks, data were worked out and supplied to the army on the variations in size and form of the human head and features

Another war project was the publication of a series of 21 papers on the peoples, history, geography and other features of war areas. These were issued under the title Smithsonian War Background Studies and covered practically every country and island group involved in the war in the Pacific, in addition to several on other war areas of special interest and on general war background topics. The series became popular at once and large numbers of copies were used for orientation work in the armed services

In all more than 600,000 copies were printed.

Soon after the beginning of the war thousands of the priceless and irreplaceable specimens in the collections of the National museum were evacuated to a place of safety outside of Washington

By the end of 1945 all this material was returned to the museum

Art.-Smithsonian activities in the realm of art received unprecedented impetus in 1937 when Andrew W Mellon gave to the people of the United States through the Smith sonian institution his unexcelled art collection and a \$15,-000,000 gallery building the whole to be known as the National Gallery of Art The building, a monumental structure in Washington's Mall section, was completed and opened to the public on March 17, 1941. Starting with Mellon's own collection of 111 choice old masters and 21 pieces of sculpture, the National gallery collection soon grew greatly in size and importance through the gifts of several valuable assemblages of art works, including those of Samuel H Kress, Joseph E Widener, Lessing J Rosenwald, Chester Dale and others With these priceless acqui sitions the National gallery became from the start a centre for the study of art in the United States and one of the great galleries of the world.

Prior to the Mellon gift, the national art collections in the custody of the Smithsonian had been known as the "National Gallery of Art' In 1937 this name was changed

to National Collection of Fine Arts' in order to make the former name available for the new "Mellon" gallery Al though congress approved a building site the steadily growing National Collection of Fine Arts was still housed in temporary quarters in the natural history building of the National museum.

Publications.—In 1941, under the direction of Dr Julian H Steward, work was begun on the preparation and editing of the Handbook of South American Indians, a project of encyclopaedic proportions undertaken in co-operation with the state department's interdepartmental committee on cultural and scientific co-operation and with the National Research council. By the end of 1946 two of the five projected volumes (The Marginal Tribes and The Andean Civilizations) had been published and vols 3 and 4 were in galley proof. These finely illustrated books written by leading South American as well as North American anthropologists, provided for the first time a comprehensive sum mary of existing knowledge of the Indians of South America

For many years, as a service to scientists and students throughout the world, the Smithsonian had maintained a group of publications in the nature of handbooks of in formation on geographical, physical and mathematical subjects. Three volumes of these publications were revised and reprinted during the period—Smithsonian Meteoro logical Tables, in 1939, Smithsonian Mathematical Formulae and Tables of Elliptic Functions, in 1939 and Smith sonian Mathematical Tables (Hyperbolic Functions) in 1942, in addition, World Weather Records, a monumental 2 vol reference work in meteorology, was reprinted in 1944 under a grant from John A Roebling

The Annual Reports of the Smithsonian had been published for 100 years without a break. Throughout this time, hundreds of distinguished articles by leading scientists had been given wide distribution in the appendices of these reports, and altogether they formed a unique record of scientific progress during the century.

Other Activities.—Beginning in 1937 radio was used by the Smithsonian institution for the first time on an extensive scale in the diffusion of knowledge. "The World Is Yours," a half hour dramatized program, sponsored jointly by the Smithsonian institution, the US office of education and the National Broadcasting Co, first went on the air on June 7, 1936, and nearly every week for more than 300 weeks the program presented some phase of science, invention, history and art to a nation wide radio audience. The series from the beginning struck a responsive chord in radio listeners throughout the country, and twice from an official rating service the program received top rating among all non commercial programs on all networks. Be cause of the urgent demand of war agencies for radio time the series was terminated on May 10, 1942.

World War II temporarily disrupted the activities of the International Exchange service. This agency with the function of facilitating the distribution of scientific publications to and from foreign countries, had been a part of the Smithsonian from 1849. In 1939, approximately 715 000 packages of scientific publications passed through the service

At the end of 1946 the Smithsonian library, including all its several branches plus the Smithsonian deposit at the Library of Congress, aggregated nearly 1,000,000 volumes

The ten years saw important personnel changes in the Smithsonian organization

On January 16, 1942, Chief Justice Hailan F Stone was elected chancellor of the institution to succeed former

Chief Justice Charles E. Hughes. Justice Stone served until his death on April 22, 1946. Dr. Charles G. Abbot, astrophysicist, who had been secretary of the institution from 1928, resigned on July 1, 1944, and on the following Jan. 12, Dr. Alexander Wetmore, biologist, was named by the board of regents to succeed Dr. Abbot. Dr. Wetmore had been assistant secretary of the institution from 1925. John E. Graf was advanced from associate director of the National museum to assistant secretary of the institution on April 1, 1945.

The Freer Gallery of Art lost its director in the death of John Ellerton Lodge on Dec. 29, 1942. Lodge, a gifted linguist and orientalist, served 22 years as director of the gallery, and during that period he added to the original Freer collection many works of major importance in the fields of Chinese bronzes, paintings, jades, sculpture and ceramics; Indian paintings and sculptures; Arabic, Persian and Armenian manuscripts and paintings; and Syrian and Persian glass, pottery and metal work. Archibald G. Wenley became the new director of the Freer gallery on Jan. 16, 1943.

At the end of the fiscal year 1936 the capital funds of the institution totalled \$6,462,121. By the end of 1945 this figure had risen to \$8,621,189 by reason of various gifts and investments. One of the largest gifts in this period was an addition of \$400,000 to the Charles D. and Mary Vaux Walcott research fund for development of geological and palaeontological studies and publishing results thereof. from Mrs. Walcott's estate. Another was \$300,000 received from Miss Annie May Hegeman to establish the Henry Kirke Porter fund in honour of her stepfather.

In 1937, under an allotment from Public Works administration funds, five new buildings were added to the National Zoological park. Located in Rock Creek park in Washington, the zoo had grown to be one of the chief attractions of the city, and the new buildings added greatly to the attractiveness of the park as well as providing more adequate facilities for the animals.

The number of visitors to Smithsonian buildings reached an all-time high in 1940, when more than 2,500,000 were recorded. (A. WT.)

Smuggling

See Immigration and Emigration, U.S.

Smuts, Jan Christiaan

Smuts (1870-), South African statesman, soldier and philosopher, was born May 24, 1870, near Riebeek West in Cape Colony. He was educated at Cambridge university, England, and was admitted to the Capetown bar in 1895. During the Boer War, Smuts joined the Boer army in 1900, eventually becoming chief of a commando detachment.

After the restoration of peace, he actively campaigned to smooth over political and racial differences. Upon the outbreak of World War I in 1914, Smuts became commander of South African armies preparing for battle with the Germans in Southwest Africa. That same year, Louis Botha, with Smuts's co-operation, helped put down the Dutch rebellion. Smuts was a member of the peace conference in Versailles and in 1919 wrote his celebrated memorandum on the League of Nations, which was endorsed by Lloyd George and Woodrow Wilson; in substance, it became the League covenant.

Smuts was prime minister of South Africa from 1919 to 1924. Inactive in South African politics after 1924, he re-entered the political arena as war with the axis threatened. Britain's declaration of war against Germany on Sept. 3, 1939, brought him back as prime minister. On Sept. 6 Smuts formed a war cabinet, and the Union proclaimed a state of war with Germany. He was made a field marshal in the British army in 1941.

In a speech at London on Nov. 25, 1943, Smuts predicted that Britain would emerge from the war as the weakest member of a trinity of states that would include the United States and the soviet union. To offset this weakness, he suggested that Britain take the smaller states of postwar Europe into its orbit. The marshal attended the sessions of the United Nations conference in San Francisco, Calif. (April-June 1945), as a delegate of the Union of South Africa. He also attended the 21-nation peace conference in Paris in the late summer and early fall of 1946. At the U.N. general assembly sessions in Lake Success, N.Y., he warned the U.N. in Nov. 1946 that if it did not approve South Africa's proposal to annex the former Southwest Africa mandate. South Africa would continue ruling the area with or without U.N. approval.

Snyder, John Wesley

Snyder (1896-), U.S. government official, was born June 21, 1896, at Jonesboro, Ark. A student at Vanderbilt university, Nashville, Tenn., 1914-15, he joined the army in 1917 and was promoted to artillery captain. While in France, he met Capt. Harry S. Truman and the two continued their friendship after the war. Entering the banking profession, Snyder became national bank receiver in the office of the comptroller of currency in Washington, D.C., 1930. He held important posts with the Reconstruction Finance corporation and its subsidiary from 1937 to 1943. In the latter year, Snyder resigned from his various governmental posts to return to private banking. On April 17. 1945, President Truman appointed Snyder federal loan administrator; three months later (July 16), he was made director of the Office of War Mobilization and Reconversion. On June 6, 1946, the president named Snyder as secretary of the treasury, succeeding Fred Vinson, who had been appointed chief justice of the U.S. supreme court. Snyder also served as board chairman of both the world bank and the international fund until Oct. 3, 1946, when he was succeeded by Hugh Dalton, British chancellor of the exchequer.

Soap, Perfumery and Cosmetics

The beginning of the decade, 1937-46, found the soap, perfumery and cosmetics industries struggling in the toils of a federal excise tax law, so-called. Actually, the tax was originally one on gross sales. The burden of it was sufficiently heavy-10% on cosmetics and perfumes, 5% on soaps-to impel resort to a variety of expedients that would legitimately minimize the load. The most notable of these was the creation of the "independent" subsidiary sales company which bought goods from the parent "at arm's length," at prices which covered only manufacturing costs. Fven so, prime producers had to pay tax on containers, often the most expensive part of their products. A confused situation arose, in which companies existed by a method that could best be described as "taking in each other's washing." While no supporting data existed, it finally became clear that for the government the cost of collecting (and policing) the law grew out of all proportion to the income received from it. Of its cost to the industries there was no doubt. And while the intent was to collect a tax from manufacturers that could not be passed on to the ordinary man or, in this instance, the ordinary

woman, nevertheless, however indirectly, the law probably added greatly to the ultimate public cost of the goods in question.

In the fall of 1941 the burden of this tax was at last shifted to where, from every point of view save that of the acutely vote-conscious politician, it had always properly belonged: directly on the ultimate consumer. Thus the cost of collection to the federal government was minimized; the gross revenue increased with almost no extra cost to the consumer; the industries were relieved of a wasteful and irritating situation and were able to set their several corporate houses in order. This transfer of a luxury tax from producer to consumer constituted no more than reversion to a system that had already served the people and the government satisfactorily in 1861, 1898 and 1914.

Another and far more important development during the decade arose out of the enactment of a new federal Food, Drug and Cosmetics act. This act became operative on Jan. 1, 1940, when it superseded the wholly ineffective Pure Food law of 1906. The most obvious effect of the new law to the public was probably the extent to which it compelled irresponsible advertisers to tone down their extravagant claims, with (it was hoped) some benefit to the consumer as well as to those manufacturers who always were restrained with respect to their claims in advertising by some sense of social responsibility.

The law, in this connection, had the somewhat curious effect of turning the imaginative attentions of these industries to perfume, as the touchstone for happiness-ever-after. It was significant that in one periodical—a magazine by no means limited to feminine editorial appeal—fully 40% of all the advertising in the issue immediately preceding Mother's day, 1946, was devoted to perfume. This was, however, precisely where such advertising appeal—if it had any justification at all—belonged; since at even the highest levels of intelligence human beings actually are, to a large extent, emotionally governed and guided, impelled or restrained, by their sense of smell.

The law also proved to be of great practical benefit not only to the socially minded producer but also to the consuming public. For among the manufacturers, irresponsibility did not confine itself to windy words and specious phrases. Under the 1906 law, so long as he shunned downright deadly poison, a maker could put almost anything he wanted into his compounds. There was no doubt that many were using materials, and selling finished goods, that were definitely if not invariably harmful. If any direct evidence of this should be needed it could be found in the steady increase during, say, the 20 years 1920-40, of the use of protective insurance by manufacturers against the liability of damage awards to injured customers by the courts. It was further a fact that during that period certain types of commodities were continuously offered to the public on which no insuring company would assume a risk. The new law effectively protected the people against the worst of those risks to which they were previously unwittingly exposed.

The history of World War II's influence on these three industries was by and large the history of its influence on all industries catering to the ultimate consumer: an ever-increasing demand created almost entirely by full employment and the monetary inflation, versus a steadily decreasing supply. From Sept. 1939 until well into 1946 these industries enjoyed a sellers' market.

Annual sales at retail for the decade of perfumes, cosmetics and toilet preparations, as estimated by the Toilet

Goods association, were as follows: 1937, \$352,000,000; 1938, \$366,100,000; 1939, \$387,600,000; 1940, \$400,000,000; 1941, \$419,600,000; 1942, \$439,600,000; 1943, \$461,000,000; 1944, \$546,300,000; 1945, \$655,000,000; 1946, \$699,600,000.

The biggest single factor in this rise undoubtedly was the very large increase in trademarked lines, generally consisting of such items as shaving soaps, shaving lotions, talcum powders, toilet waters, pomades, sun-tan preparations, etc.—lines designed exclusively for male consumption. To be sure, men had always bought and used such products but certainly never before to the extent that they did during the decade. The market for men's toiletries was variously estimated at from \$50,000,000 to \$80,000,000 a year in 1946.

By early 1941 exports from the United States to the British dominions and colonies, the largest part of the export market, had been brought to a standstill. Those U.S. firms with British subsidiaries—and almost all of any size or consequence had them after 1931-could divert this business to their British houses. For although Great Britain had already severely limited production for home use, it was still anxious to retain all possible export luxury trade for the sake of foreign exchange balances. However, as early as 1942, it was obliged to restrict even this business, partly because of increasing scarcity of such essential materials as paper and boxboard, but largely for politicomilitary considerations. Thus, the whole lend-lease position might have been jeopardized if while obtaining under it the pulp vitally needed to manufacture paper and explosives Britain had continued to export luxury goods packed in paper and cardboard.

As late as the third quarter of 1946, these industries were still operating "under wraps" in Great Britain. As a part of the "austerities program," domestic limitations on production were in full wartime force. Additional quota for export was readily obtainable. However, this quota was expressed in money (sterling) and it still did not solve the primary problem of obtaining the materials for which it was permissive. Many of these materials normally came from France where, in the case of the best pertume materials, the situation arising from the stringency of fuel power and transportation afflicting all industries was still further aggravated by the continuing shortage of fats.

Soccer

The east dominated soccer during 1937-46, sweeping all 10 national amateur challenge cups and capturing 7 national open challenge cups, emblematic of the United States championship. Chicago teams upheld the west in the annual playoffs, the Spartas winning in 1938 and the Vikings in 1946. The Spartas and Baltimore, Md., Soccer club were tied for the championship in 1940.

teams before and after World War II, soccer gained considerable popularity in the United States during the 1937–46 decade. The Charlton athletics of England attracted much attention during a U.S. tour in 1938, as did the Scottish All-Stars in 1939. The Liverpool Football club of Liverpool, England, brought the United States its first international soccer of the postwar period and was victorious in both its U.S. appearances. (M. P. W.)

Socialism

The decade 1937–46 began in Europe with democratic socialist parties as the strongest parties in the Scandinavian countries and in control of their respective governments; as the principal opposition party in Great Britain, and as the largest party in the popular front which in 1936 had come to power in France. Nevertheless, socialism was already on the defensive as against tascist and communist totalitarianism. It had been driven completely underground in Germany and Austria and, with the coming of World War II, it fell before Hitler's advancing armies, while, during the decade, the Labour and Socialist International disappeared. By the end of 1946, the international had not yet been reconstituted, but conferences of European Socialists had been held in England to lay the foundation for a new international.

In every country Socialist parties or the dominant factions in them strove in the '30s to keep out of war. This desire for peace at home and abroad led Léon Blum, the Socialist prime minister of the popular front in France, to support a so-called nonintervention policy. Until late in 1937 the British Labour party backed the Conservative government of Britain in a similar policy, though it later opposed the policy which led to the Munich pact.

With the ending of World War II socialist parties emerged from their grim underground existence with surprising strength in all countries in Europe which were not under dictatorship or in the soviet sphere of influence. In most European countries, socialism presented itself as the principal alternative to communism. Labour and Socialist parties constituted the largest single parties in Great Britain, Sweden, Norway, Denmark, Belgium, Switzerland and Finland, constituted the governments in the three first-named countries and were members of coalition cabinets in Austria, Belgium, Czechoslovakia, France, the Netherlands, Hungary, Italy and other countries. The most significant victory of democratic socialism immediately after the war was that of the British Labour party in June 1945

In the western hemisphere, in both Americas, the labour movement made substantial gains during the decade. Organized socialism, however, made no such progress except in Canada, where the Co-operative Commonwealth federation showed growing strength. In Asia Japanese socialism showed increasing strength under the occupation after World War II. Socialists were a factor of some consequence in the India Congress party during this period. Jawaharlal Nehru, head of the interim government, being a socialist in philosophy. The Indonesians likewise selected Sutan Sjahrir, a socialist leader, as head of the struggling Indonesian republic.

In Australia and New Zealand socialist and labour forces maintained control of the governments throughout the decade. A brief recapitulation of events in various countries follows.

Great Britain.-The British Labour party at the beginning of the decade was his majesty's chief opposition, with 154 members of the house of commons against 387 Conservatives. It swung to bold opposition to nazi aggression slowly but more rapidly and vigorously than did the Conservatives. It supported the war but criticized the Chamberlain government for failing to mobilize Britain's full resources. On the resignation of the Chamberlain cabinet May 10, 1940, the Labour party joined the war coalition government under Winston Churchill, and its leaders (among them C. R. Attlee, Einest Bevin, Herbert Morrison, Hugh Dalton and A. V. Alexander) served in important posts throughout the war. The small, leftist Independent Labour party remained outside the coalition. So did the newly formed Common Wealth party, a socialist but definitely non-Marxist organization.

Shortly after the defeat of Germany in 1945 the Labourites resigned their seats in the cabinet and asked for a gencial election. In the ensuing campaign the party issued a manifesto, "Let Us Face the Future." in which it pledged itself, if elected, to legislate for the public ownership of some of the key industries, a comprehensive national health service and an extensive housing program, while working for the gradual establishment "of the socialist

"The Painless Way," a 1945 cartoon by Shoemaker of the Chicago Daily News comparing the methods chosen in Great Britain and Russia for adopting socialism

commonwealth of Great Britain free, democratic, efficient, progressive, public spirited."

In the elections of July 1945, 393 Labourites were elected out of a total of 640, as compared with 197 Conservatives. The Labour party thus obtained, for the first time in its history, a majority of parliamentary seats. Attlee became prime minister; Bevin, foreign minister; Morrison, lord president of the council and leader of the house of commons; Dalton, chancellor of the exchequer and Sir Stafford Cripps, president of the board of trade, in an all-Labour cabinet.

During its first year of office the Labour government nationalized the Bank of England and the coal-mining industry, enacted the National Insurance bill which provided cradle to grave social security for the entire nation and rescinded the Trade Disputes and Trade Unions act passed by the Conservative government in 1927 after the general strike of 1926. It introduced bills for the nationalization of civil aviation, of telecommunications and of atomic energy and for complete medical, dental and specialist services under the national health service. The government likewise announced its intention of bringing electricity, gas and power and inland transportation under public ownership.

In international affairs the government gave to India the choice of self-government within the British commonwealth of nations or of becoming an independent nation. At the end of the year it was still negotiating with the Jews and Arabs regarding the solution of the Palestinian problem. (See also LABOUR PARTY, GREAT BRITAIN.)

In the neighbouring country of Northern Ireland Labour in the July 1945 election won two parliamentary seats, while in Eire, June 1944, Labour sent to the first chamber eight representatives.

Sweden.—The one European country in which socialists remained at the head of the government throughout the decade 1937–46 was Sweden. In the 1936 parliamentary elections the Social Democratic party, a moderate socialist party, won 112 seats in the lower chamber, 45.9% of the total.

Following the election Per Albin Hansson, leader of the Social Democrats, again assumed the premiership and appointed to his cabinet eight Socialists and four Agrarians. After the outbreak of World War II the Social Democrats, as a means of preserving national unity, organized a new four-party coalition government. In 1940 a new parliamentary election was held which resulted in the Social Democrats' obtaining 134 seats out of 230. One of the chief aims of the government during the following years was the preserving of the nation's neutrality and its independence against the pressures from the third reich. The Social Democrats during World War II gave great aid to the Norwegian and Danish underground and to the cause of the Allies.

In the 1944 elections the Social Democratic party returned 115 members to the lower house. In July 1945 the four-party coalition government was dissolved and on July 31 an all-Social Democratic cabinet was formed.

On Oct. 5, 1946, Prime Minister Hansson died, after serving as prime minister for 14 years. Tage Erlander, minister of education, was chosen as Hansson's successor.

Norway.—In the neighbouring Scandinavian countries of Norway and Denmark the socialist parties, which were in charge of their respective governments during most of the '30s, were forced underground when the Germans occupied those countries during World War II. Following

the liberation these parties again became powerful political forces in their respective countries.

In the 1936 elections in Norway the Norwegian Labour party was returned to power, Labour winning 70 scats in a unicameral legislature of 150 representatives. Johan Nygaardsvold, Labour premier from 1932, was again called upon to form the cabinet.

When the Germans invaded the country, many of the leaders of the Labour government escaped from Norway and established in London on June 10, 1940, the official Norwegian government—a coalition government of Labour, Conservatives, Liberals and Agrarians. This government assumed control of the powerful Norwegian merchant marine and directed much of the underground movement which conducted a continuous sabotage against the Germans and the Quisling government set up by the Germans.

Following the defeat of Germany the Norwegian government-in-exile resigned and was reconstituted with Einar Gerhardsen, chairman of the Labour party and formerly mayor of Oslo, as prime minister. In the ensuing elections of Oct. 8, 1945, the first elections held on the European continent after the end of the war, the Norwegian Labourites won a majority of the seats in parliament—76 out of 150. The communists elected 11 members. Gerhardsen again became Norway's prime minister. Trygve Lie, minister of foreign affairs in the Norwegian cabinet from 1940, left this post in 1946 to become secretary general of the United Nations.

Denmark.—In Denmark, where Thorvald Stauning, Social Democrat, had served as prime minister from 1929, the year 1935 found the left-wing parties for the first time in the history of Denmark represented by a majority of members in both the lower and the upper chambers of parliament. This revolution to a Socialist-Radical-controlled legislature made possible the passage of progressive legislation on a scale hitherto unheard of in Danish history. Four years later, on the eve of World War II, the Social Democrats won 64 seats in a house of 149, a decrease of 4, and the Radical party, 14.

On April 9, 1940 when Hitler ordered the invasion of Denmark, King Christian appealed to the people to refrain from resistance on the ground that such resistance would lead to Denmark's annihilation. The Germans occupied the country and deprived the government of most of its power. On July 3, 1940, leaders of the five principal parties decided to "abandon all points of disagreement and unite to make secure the independence and integrity promised our country."

In the following years of World War II, the German government brought great pressure on the Danish government to become a mere puppet of the reich. Many of Hitler's demands, however, were refused. Stauning remained in office and kept the free trade unions intact. Shortly before Stauning's death in May 1942, the reich forced the cabinet to accept Eric Scavenius, collaborationist, as foreign minister, and on Nov. 8, 1942, the Germans compelled the reorganization of the cabinet with Scavenius as premier. On March 23, 1943, in one of the few elections held in Europe during the war, the Social Democrats obtained 45.5% of the total, while the pro-nazi Farmers' and nazi parties received less than 3.5% of the total and the distinctly German nazi party, a little more than 1%.

On May 9, 1945, following the defeat of Germany, a provisional government was formed under Vilhelm Buhl, Social Democrat, an underground leader. In the general elections of Oct. 30, 1945, the Socialist representation in

parliament, however, fell to 48. The Communists increased their parliamentary membership to 18, while the Agrarians won 38 seats out of a total of 149. Though the Social Democrats were still the largest party, Buhl refused to form a minority or coalition government, and the Agrarians undertook to organize the first non-socialist government in Denmark since 1929.

France.—At the beginning of the decade 1937–46, the French Socialist party was one of the most prominent of the socialist political organizations on the European continent. In the May 1936 elections Socialists had joined with Radicals, and with Communists, two trade union federations and several other left-wing groups in a popular front movement with a view of effectively fighting fascist forces in France. In the spring elections the Socialist party increased its representation from 101 to 148, and the Communist party, from 10 to 73.

The popular front parties, controlling a majority of seats in the house of deputies, proceeded to form the government. On June 4, 1936, Léon Blum, leader of the Socialist party, was selected as premier. The Socialists were represented in the cabinet by 19 members; the Radicals with 16. The Communists, refusing to join, declared that they would support the government, "while continuing to administer to the masses." The house of deputies, under the leadership of Premier Blum, passed liberal educational, social insurance, taxation and agrarian legislation and authorized the government to take over armament manufacturing plants.

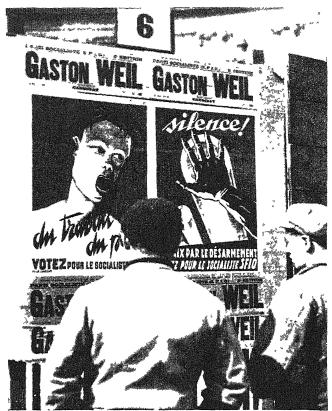

In the spring of 1937 Premier Blum asked for emergency financial powers to protect the franc and public credit against speculative attack. On being denied these powers, he resigned on June 21, 1937. Blum again assumed the premiership March 10, 1938. The senate, however, refused to go along with his financial plan for a graduated capital levy, and he handed in his resignation on April 8, 1938. Socialists refused to accept posts in the ensuing Daladier cabinet, an action which spelled the virtual death of the popular front.

In Sept. 1939, at the outbreak of World War II, the French Socialist party voted its support of the war. It opposed attempts to suppress parliamentary activity and urged a progressive policy in the French control of the country's North African colonies. Party members later became prominent in the war ministry.

With the defeat of France in 1940 and the creation of the Pétain government, the Socialist party was outlawed and Léon Blum and other Socialists were put on trial at Riom, accused of responsibility for France's defeat. As a result of Blum's forceful defense of his role in France as prime minister, the trial was discontinued and Blum and other Socialists were removed from France to prevent their taking part in à revolt against Hitler.

Through the period of the Pétain government Socialists and Communists—the latter after Hitler's invasion of the U.S.S.R.—took an active part in the underground movement. The Socialist party affiliated itself with the National Council of Resistance, which drew up a charter on March 15, 1944, calling, among other things, for the nationalization of mines, electric power, big banks and insurance companies and the abolition of trusts in fields left to private enterprise.

In early 1945 Socialists took an active part in the De Gaulle government, and following the defeat of Germany participated vigorously in the French elections. In the elections of Oct. 21 for the national assembly, the Socialist party came third in the number of parliamentary seats, electing 139 deputies, as compared with 151 for the Com-

Campaign poster for a French Socialist candidate prior to the general elections of Oct. 1945, in which workers were promised peace through disarmament

munists and 150 for the Popular Republican (Catholic) party. These three parties obtained nearly nine-tenths of the popular vote.

In the coalition cabinet formed following the elections under Gen. de Gaulle, Socialists received six important posts and Felix Gouin, Socialist, was elected president of the assembly. On Jan. 20, 1946, Gen. de Gaulle resigned from the presidency; the Socialists, among others, had opposed his demand for increasing military appropriations and an independent executive—and three days later Gouin, Socialist leader, was elected president.

On Jan. 26, 1946, Gouin organized a three-party cabinet containing seven Socialists, six Communists, six Popular Republicans and one nonparty man. Under Gouin's presidency the constituent assembly in March voted for the nationalization of France's electrical and gas industries, these industries to be directed by an 18-member commission composed equally of representatives of the state, the consumers and the industry. In April the constituent assembly decreed the nationalization of many of France's largest insurance companies, following the nationalization of the Bank of France, the four principal deposit banks and many of the mines.

The Socialist party joined with the Communists in supporting a constitution which proposed giving to a unicameral national assembly power to elect a premier from among its members and to select a president of the republic, who would exercise little but honorary functions. The French people, however, rejected the proposed constitution. On June 2, 1946, in the new elections for the assembly, Socialists elected 122 deputies, Communists 149, Popular Republicans 162, Edouard Herriot's Radical party 40 and the Right parties 54. Gouin immediately resigned his presidency and Georges Bidault, of the Popular Re-

publicans, was chosen to lead the nation. On Oct. 13, a new and revised draft of the constitution, supported by the three principal parties, was adopted by a small majority against the opposition of Gen. de Gaulle. The preamble of the constitution, among other things, declared that "all property and all businesses whose exploitation has acquired the characteristics of a national public service or a monopoly in fact should become the property of the community."

Belgium.—In the elections of 1936, the Belgian Labour party had elected 70 deputies, and again became the country's largest single party, with the Catholics' representation dropping from 79 members in the lower chamber to 63. In the new four-party cabinet formed by Paul van Zeeland, Catholic leader, Paul-Henri Spaak, Socialist, was appointed minister of foreign affairs. In the electoral fight of 1937, the Labourites supported Prime Minister van Zeeland in his successful fight against Léon Degrelle, Rexist (fascist) leader.

Early in 1938 Spaak became prime minister, heading a coalition government. On Christmas day 1938 the Belgian socialist movement lost by death its most distinguished leader, Emile Vandervelde. In the elections of 1939 the Labour party again gave place to the Catholics as the country's leading party, and during the next year Hubert Pierlot, Catholic, and Spaak, Socialist, alternated as premiers. Following the German invasion of May 1940 many leading Socialists left Belgium and Spaak and other Socialist leaders became affiliated with the Belgian government-in-exile.

On Feb. 11, 1945, following the return of the government, Achille van Acker, a leading member of the Belgian underground, was asked to form a four-party cabinet with Spaak again as foreign minister. The following year, in the parliamentary elections of Feb. 17, 1946, the Catholic party won first place, electing 92 deputies out of 202; the Labourites 69 and the Communists 23.

During the next month or so temporary coalition cabinets were formed under Van Acker and Spaak. On March 31, 1946, Van Acker formed a government of Socialists, Communists and Liberals, with the Catholics as the government's chief opposition. In the following days the question as to whether Belgium should invite King Leopold to return continued to provide a subject for much bitter discussion within and without parliament, the Socialists and other left-wing groups urging the abdication of the king. On July 26 the chamber of deputies, in voting its confidence in the Van Acker government, indirectly voiced its support of the abdication proposal.

Another political crisis, however, soon took place, resulting in the organization on Aug. 2 of another coalition government, this time headed by Camille Huysmans, veteran Socialist, long burgomaster of Antwerp.

Netherlands.—In the Netherlands the mid-'30s found the Social Democratic Labour party the second largest in the field with the Catholic party occupying first place. In the elections of May 1937 the S.D.L.P. secured 23 seats out of a total of 100, the Catholics 31 and the Communists 3. Two years later, in Aug. 1939, on the eve of World War II, the Social Democrats entered the cabinet for the first time in the country's history.

When the Germans invaded the Netherlands in May 1940, the queen and all members of the cabinet left the country and set up a government-in-exile in London. Queen Wilhelmina entrusted Willem Drees, leader of the Social Democratic party, and Willem Schermerhorn, leader

of the Peoples movement, with the formation of the cabinet. A provisional coalition cabinet was set up contain ing Social Democratic, Catholic, Christian Historical and Peoples movement representatives. Schermerhorn, a former professor of geodesy and a resistance leader during the occupation, was elected premier.

Following the formation of the cabinet, members of the Peoples movement merged with the Socialists, with the Liberal Democratic party and with advanced Catholic and Protestant groups, to form a Dutch Labour party. The party, in its inaugural program, expressed itself in favour of the nationalization of mines, the Bank of the Netherlands, the nation's railroads, blast furnaces and business monopolies.

The first postwar elections in May 1946, resulted in giving the Catholic People's party 32 seats, the Labour party 29, the four Protestant parties 23, the Communists 10 and the Liberals 6. As Labour came out second in these elections, Schermerhorn resigned as premier and was succeeded by Louis J. M. Beel, liberal Catholic.

The Catholics, following the elections, asked Labour to form a coalition cabinet with them. Labour replied that it would join only if its conciliatory Indonesian policy were accepted and applied by persons acceptable to it. Following several weeks of negotiation a coalition cabinet of five Catholics, five Labourites and three nonpolitical specialists was formed. Prof. Schermerhorn was appointed commissioner general of the Netherlands Indies. In the July 1946 municipal elections, Labour led the field in Rotterdam and the Hague, and the Communists in Amsterdam.

Spain.—In the Spanish elections of 1936 Socialist, Communist and other groups had banded together under the name "popular front" and in the elections of that year won 256 seats, against 165 captured by the right and 52 by the centre party. The ensuing government, under Pres. Manuel Azaña and Premier Casares Quiroga, threw down a challenge to fascist forces which soon began to mobilize under Gen. Francisco Franco, who declared his goal to be a "broadly totalitarian" government.

Gen. Franco received much aid from the governments of Hitler and Mussolini and soon became the ruler over much of Spain. A serious dissension occurred within the anti-Franco movement when anarcho-syndicalists staged an uprising in Barcelona in May 1937. After this outbreak anarcho-syndicalists were eliminated from the new cabinet headed by Dr. Juan Negrín, who succeeded Largo Caballero. Negrín and his cabinet were in turn ousted by a council of defense, formed on March 5, 1939, of all parties except the Communist. On March 28, 1939, following a week of revolt on the part of the Communists and the former premier's supporters, the loyalist government surrendered. All Socialist and Radical groups were suppressed, and all political groups were merged in one government party under the control of Gen. Franco. Thousands of antifascists were arrested, imprisoned and executed.

On Nov. 22, 1943, many of the republican leaders set up a Spanish Committee of Liberation to prepare a provisional regime to succeed Franco. On Aug. 29, 1945, a Spanish Republican government-in-exile, headed by former Premier José Giral, was formed. During the succeeding months this group conducted a widespread campaign against Franco.

Switzerland.—The middle of the 1930s found the Swiss Social Democratic party the largest in the country, with a total of 50 seats in the lower house's 194. In 1943, for the first time, a Socialist was admitted to the Swiss federal

council of seven, chosen by parliament. In the election of that year the Social Democratic party increased its representation in the national council to 54–28% of the total membership—7 seats more than its nearest rival, the Radical Democratic party. During and following the parliamentary campaign the Social Democrats advocated as a part of their postwar program the nationalization of heavy industries and of private enterprises of a monopolistic nature.

Austria.—In central Europe the end of the decade saw the formerly powerful socialist movements in Austria, Hungary and Germany on the road to revival, following years of suppression. In Austria, from 1931 until the defeat of Germany in 1945, the Socialists existed only as an underground movement. On April 29, 1945, when it was clear that the deleat of Germany was imminent, an Austrian provisional government was set up in Vienna under the leadership of Dr. Karl Renner, Socialist and former chancellor of the Austrian republic.

Elections for the national and provincial assemblies were held on Nov. 25, 1945, resulting in the election of 84 members of the Catholic People's party to the national legislature, 76 Social Democrats and only 5 Communists, in a body of 165 members. In Vienna the Social Democrats elected the largest number of councilmen and the city's mayor. Following the establishment in December of the second Austrian republic, Dr. Renner was elected president, and Leopold Figl of the Catholic party took over the chancellorship. Karl Gruber, Social Democrat, was chosen vice-chancellor.

On the initiative of the Social Democrats the Austrian parliament during 1946 passed a law for the nationalization of a number of branches of industry, including oil, shipping, electric power, metallurgy and banking. The soviet military commander demanded that this law be annulled on the ground that these industries, many of which had been forcibly Germanized under the nazi regime, belonged to the soviet government. The U.S. commander, with the support of the British, rejected this demand, with the result that the law went into effect on Sept. 9, 1946. Soviet authorities, however, arrested a number of Austrians who attempted to carry out the parliamentary decrees.

Germany.—In 1933 the socialists and all parties except the nazi party were outlawed in Germany. Many socialists, communists and other anti-nazis were active in the underground movement, and many were sent to concentration camps and executed.

On the defeat of Germany, the territory remaining in the former reich was temporarily partitioned into soviet, British, French and U.S. zones. On Sept. 13, 1945, the U.S.S.R. announced the establishment of a German government for its entire occupation zone, composed of Communists, left-wing Socialists, Christian Democrats, Liberal Democrats and Independents. The U.S.S.R. occupying forces threw their weight on the side of the Communists. As a result of strong pressure exerted by the soviet occupying authorities, Social Democrats in the zone in April 1946, joined with Communists in a Socialist Unity party. Social Democrats in other zones overwhelmingly defeated the proposal of organic unity with the Communists.

During the year, state elections took place in the British, U.S. and French zones. In the U.S. and French zones, the Christian Social Union (Catholic party) obtained the largest number of votes; the Social Democrats came second and the Communists a poor third. In the soviet zone the Socialist Unity party won first place. In the municipal

elections in the four zones of Berlin on that date, however, the Social Democrats, who refused to join the Communists, received 49% of the nearly 2,000,000 votes; the Christian Democratic party 22%, the Socialist Unity party 20%, and the Liberal Democrats (conservative) 9%.

Hungary.—In Hungary, Socialists under the dictatorship of Adm. Nicholas Horthy had been a negligible political force during the 1930s. However, when the soviets entered Hungary in Dec. 1944, a provisional national assembly was set up, which formed on Dec. 23, 1944, a provisional government.

In the cabinet thus organized a number of Socialists were appointed to ministerial posts, together with Small Landowners and Communists.

A year later, in the parliamentary elections of Nov. 4, 1945, the Communists urged that a single all-party election list be drawn up. This proposal was rejected by the other parties. In the elections the conservative Small Landowners party scored a decisive victory over the Socialist and Communist opponents, the Small Landowners winning 245 seats, 60° of the total, as compared with 69 seats for the Social Democrats, 70 for the Communists and 23 for the Peasant party. In the four-party cabinet formed following the election, under the Small Landowners' leader, Premier Zoltan Tildy, Socialists were appointed to head the ministries of justice, commerce and industry.

The soviets who were occupying the country, however, through the Communist control of the important ministries of communications, interior, public welfare and other positions, and their domination of many industries formerly under nazi control secured a dominating control over the economic and political life of that country.

Italy.—After World War II the Italian Socialists (who had functioned underground during Mussolini's regime) were represented in the six-party government formed in June 1945, under Ferrucio Parri and later under Alcide de Gasperi, by Pietro Nenni, vice-premier, and others. In the general elections of June 2, 1946—the first elections for a democratic parliament in more than 20 years—the socialist party obtained second place, receiving more than one-fifth of the total votes and electing 115 deputies. The Christian Democrats came first with 207 deputies and the Communists third with 104 successful candidates out of a total of 556.

Following the election, Socialists and Communists received four seats in the De Gasperi cabinet, with the Christian Democrats taking eight seats, the Republicans two and the independents one. Pietro Nenni, leader of the Socialist party, became a minister without portfolio and later minister of foreign affairs.

On Oct. 24, 1946, the Italian Socialist party signed an agreement with the Communists in which both parties pledged themselves, while retaining their autonomy and individuality, to co-ordinate their respective activities in liquidating fascist remnants, defending the republic and public freedoms, providing among other things for the nationalization of monopolistic industries, large banks and public services, improvement of living conditions, abolition of large estates and strengthening of co-operatives.

Eastern Europe.—In eastern Europe, not including the soviet union, the strongest socialist movements during the decade 1937–46 were those in Finland and Czechoslovakia. In the Finnish elections of 1939 the Social Democrats won 80 out of the 200 seats in the country's unicameral parliament, the Agrarians trailing with 56 representatives. In 1939 the Social Democrats joined with other parties in

resisting the soviet invasion. In the elections of March 1945 the Social Democrats won 52 seats; the Popular Democrats, composed of Communists and their sympathizers, 51. On March 24. 1946, M. Pekkala, Socialist, became premier in a coalition cabinet. As a result of pressure from the U.S.S.R., a number of Finnish leaders were tried on charges of leading Finland into the war with the soviet union and Väinö Tanner, leader of the prewar Socialists and co-operators, was declared guilty of failing to take advantage of offers to mediate for a settlement of the war with the soviet union.

In Czechoslovakia prewar Socialists were divided into Czech and German Social Democrats. In a coalition government under Pres. Eduard Beneš, Socialists held a number of key positions.

On the return of the government-in-exile to Czechoslovakia early in April 1946, a four-party coalition government was formed with Zdeněk Fierlinger, Social Democrat, as premier. In Oct. 1946, Socialists supported the government in nationalizing all enterprises with more than 400 to 500 employees.

On May 27, 1946, Czech Communists won 93 seats; Slovak Communists 21; Czech Social Democrats 37; other parties 94. On July 3 Klement Gottwald, Communist, was elected premier, and a coalition government was formed with Communists in the majority. The government parties pledged themselves to a foreign policy favourable to the U.S.S.R.

In Poland Socialists exercised but little influence in the semidictatorship prevailing in that country following the 1935 dissolution of parliament. Socialists were active in the government-in-exile in London during World War II and in the Polish underground movement. After World War II the party leadership was split over the question of co-operation with the Lublin government set up by the U.S.S.R. and later recognized, following some changes, by the United States and Great Britain. Edward Osubka-Morawski, left-wing Socialist, became premier of this coalition government.

At the meeting of the deputies to the Polish Provisional National council in Feb. 1946 a motion was passed to nationalize all essential industries employing more than 50 workers, industries which contained 40% of all employees in trade and industry and 10% of all wage earners, agriculture included.

This decision was ratified in a referendum passed by the electorate on June 30, 1946.

Throughout the decade 1937–46 Socialists in Bulgaria, Rumania, Yugoslavia and Greece were in a weak position. In 1946, in all those countries except Greece, the Communist party, backed by military force, was the directing force in the governments. In the Bulgarian elections of Oct. 27, 1946, Communists secured 277 seats out of 465; Social Democrats, 9. In Yugoslavia the opposition parties refused to take part in the Nov. 11, 1945, elections for the constituent assembly, and Premier Marshal Josip Brozovich (Tito) announced that his opponents had cast only 10% of the vote. In Greece Socialists participated in the National Unity government under George Papandreou in late 1944, but were not represented in the cabinet formed after the return of the monarchy in 1946.

Australia.—In the countries of the Pacific during the decade 1937-46, the most stable labour and socialist movements were those in Australia and New Zealand. In the 1930s the Australian Labour party constituted the chief opposition in the country, and it was not until Oct. 1941,

after occupying the opposition benches for a decade, that the party, under the leadership of John Curtin, formed the government.

In constituting the cabinet, Labour invited the opposition to take part in the Advisory War council on a 50-50 basis

In the elections of Aug. 1943 Labour won another sweeping victory, electing 49 out of 75 members of the lower house and all of the 19 seats in the senate for which elections were held. This was the first time that the party had had a majority of seats in both the senate and the lower house of the Australian parliament.

On July 5, 1945, Prime Minister Curtin died and was succeeded by Joseph B. Chifley, treasurer and minister of postwar reconstruction in the Curtin cabinet. During the ensuing year the government nationalized all interstate civil air-line operations and extended the sphere of public banking. In the elections of Sept. 29, 1946, the first since the conclusion of the war, Labour was again victorious, winning 44 seats, with the Liberals trailing with 17, the Country party with 11 and the Independent Labourites with 2.

New Zealand.—The beginning of the decade found the New Zealand Labour party the majority party in parliament as a result of the 1935 elections. Under Labour Prime Minister Michael Joseph Savage, the government during the succeeding years enacted much advanced social and economic legislation, including a comprehensive Social Security law.

On the death of Premier Savage, Peter Fraser became prime minister on April 30, 1940, with Walter Nash as deputy premier. In the Sept. 24, 1943, elections, the Labour party won 45 seats as compared with 34 for the National party. Following the elections the premier continued an all-Labour party cabinet.

Japan.—The Social Democratic party was revived after the defeat of Japan. In Dec. 1945 it demanded that the government of Kijuro Shidehara resign en masse because this government had "demonstrated that it lacks power to meet the current situation." In the April 1946 elections Socialists elected 94 members to the diet out of a total of 466, Liberals 142, Co-operatives 17 and Communists 5.

India.—There was little organized Socialist activity in India during the decade, but great socialistic sentiment, as witnessed by the fact that Pandit Jawaharlal Nehru, prominent Socialist, became India's most important political leader with the possible exception of Gandhi, being chosen to head the Indian Congress party and in 1946 the Indian interim government.

Latin America.—The decade saw a considerable growth of socialist influence in Latin America. The party, however, actually lost ground in Argentina where by 1940 it achieved considerable strength both in popular vote and in representation in congress. It was the victim of the quasi-fascist movement which in 1946, in a legitimate election, confirmed the power of Juan D. Perón, who had won considerable working-class support. The Socialists, part of the coalition against him, won no seats in congress.

In Peru, the socialistic Aprista party—later called the People's party—long suppressed by the Peruvian semidictatorship—was the strongest element in a popular front movement which, on June 10, 1945, in the first free election for decades, put José Bustamento Rivero in the president's chair.

In Venezuela, socialists were active in the Democratic Action party which won a substantial victory in the election of Oct. 27, 1946. The party was committed to a considerable degree of nationalization of industry and the

In Chile, 1946 found the Communists more powerful than the Socialists. During the existence of the nazi-soviet pact, the Socialists had demanded that the Communists be excluded from the popular front which then controlled the government. The Radicals refused, and the Socialists formally withdrew from the popular front, although the Socialist ministers continued in the cabinet. Some sort of co-operation continued in the 1941 elections and in 1942 the Socialists supported Juan Antonio Rios, the successful Radical candidate for the presidency and received three cabinet posts. But in 1946 the Socialist party ran its own candidate, Bernado Ibanez, who obtained but 12,000 votes as against 190,000 for the winning Radical-Communist candidate, Gabriel Gonzalez Videla. The latter also received the support of some of the Socialists.

In general, through all Latin-American countries, including Mexico, Cuba and Brazil, Communist influence at the end of the decade was stronger than Socialist influence in the growing labour movement, and Communist propaganda was better organized and far better financed than Socialist.

Canada.—The principal progress of organized socialism on the North American continent was in Canada. In 1932 the Co-operative Commonwealth federation (C.C.F.) was formed in Calgary, Alta., and in 1933 in Regina, Sask., adopted a Socialist program of action. Originally it was a coalition of various groups, including avowed Socialists. In a comparatively short time it grew into a unified party, which, by June 1944, won an overwhelming victory in the Saskatchewan elections and set up a government headed by Thomas C. Douglas. This government made remarkable progress in such social legislation as lay within the field of a Canadian province.

In the federal elections of 1945 the C.C.F. parliamentary representation increased from 10 to 28 and its vote doubled to 806,000 (% of the total). As a result of provincial elections that year, the party secured 38% of the vote in British Columbia; 34% in Manitoba; 22% in Ontario. M. J. Coldwell, leader of the C.C.F. in parliament, became the party's president following the death of J. S. Woodsworth, one of the chief founders of the party.

United States.-In the United States, by far the richest and most powerful country in the world after World War II, private capitalism retained a degree of vigour and power which everywhere else it had lost. Nevertheless, state intervention in economic life, begun by the first Roosevelt administration under depression conditions, continued. Many welfare measures once regarded as socialist were adopted, and organized labour, especially in the C.I.O. took a more vigorous and better-organized interest in political action than at the beginning of the decade. The agency of such action was principally the Political Action committee, which followed the line of endorsing progressive candidates. At the end of the decade, however, there was considerable discussion of the formation of a new party. In New York state, under favourable election laws, two new statewide parties had been formed; first the American Labor party in 1936, and later the Liberal party, which had split off from the A.L.P. on the ground that the latter was communist-dominated. Both parties had socialistic platforms, but for major offices usually endorsed the Democratic candidates.

In 1946 a National Education committee for a New Party was organized to stimulate the formation of a party analogous to the C.C.F. in Canada. Its program could be described as socialistic, and the Socialist party at its 1946 convention made more definite and emphatic its long-

standing endorsement of the emergence of a new mass party. The Socialist party, the Social Democratic federation, the Michigan Commonwealth federation and various progressive groups sent official or unofficial representatives to the conferences, out of which the new committee was formed. John Dewey was made its honorary president and J. Philip Randolph, president of the Brotherhood of Sleeping Car Porters, its acting president.

The Socialist party itself continued its own electoral activities but, on the whole, lost ground, a process which was first noted in the 1936 election. Part of the reason was the steady tendency in important states to monopolize the ballot by new and more stringent election laws or by more stringent interpretation of old laws. The principal reason, however, for the decline in Socialist votes was the general swing of labour and progressive elements to support of Roosevelt in his various campaigns. In 1936 the Social Democratic federation split off from the party over various issues of policy and in particular because of fear that the party was becoming too friendly and co-operative with Communists.

The S.D.F. supported Roosevelt from the 1936 campaign on. In New York state, where their principal strength lay, they participated in the formation of the American Labor party and later of the Liberal party. Connecticut Socialists under Jasper MacLevy, mayor of Bridgeport, withdrew in 1936 from the Socialist party on the issue of state autonomy but supported the party ticket in national elections. By the end of the decade cordial relations were re-established between the Socialist party and the S.D.F., and there was talk of organic unity.

In 1936, 1940 and 1944 Norman Thomas was Socialist presidential candidate. His running mates for vice-president were George Nelson of Wisconsin in 1936, Maynard Krueger of Illinois in 1940 and Darlington Hoopes of Pennsylvania in 1944. The recorded vote fell to 80,419 in 1944. In the same year the Socialist Labor party, rigid Marxists according to the semisyndicalist interpretation of Daniel DeLeon, received 45,335 votes.

Until the Japanese attack on Pearl Harbor the Socialist party opposed U.S. entry into World War II. Its 1944 platform called for: (1) a political offensive to help win the earliest peace that would last, followed by the forma-

Norman Thomas (left) with Maynard C. Krueger, who was elected national chairman of the U.S. Socialist party at the party's convention in Milwaukee, Wis., June 1, 1942, after Thomas declined to run again

tion of an inclusive international federation and by co operative action to remove the causes of war (2) social ownership and democratic control of 'the commanding heights of' the economic order—natural resources money banking and credit and monopolies, semimonopolies and other exploited industries (3) the establishment of equality of rights and obligations among all races, and (4) "a democratic socialist party with mass support" similar to the Canadian CCF (See also Communism, Labour Party, Great Britain, Liberalism)

Social Security

The US Social Security act of 1935 and its subsequent amendments, provided measures to improve the general welfare through eight programs for which the Social Security administration carried federal responsibilities. Un der organizational changes effective in July 1946, federal responsibilities for social security were vested in the Social Security administration, one of four main units of the Federal Security agency $(q\ v)$ The Social Security administration included all bureaus of the Social Security board, which was abolished in the reorganization, and in addition included the children's bureau, which was transferred with all but its child labour functions from the department of labour

Federal old age and survivois insurance, financed by employer and employee contributions, afforded insured industrial and commercial workers continuing retirement income in old age and monthly income for their dependents and survivors, as well as lump sum death payments

Under federal-state unemployment insurance a federal tax of 3% was levied on industrial and commercial employers of eight or more workers, and these employers credited, against as much as 90% of the federal tax, the amounts they paid—or would have paid but for experience-rating reductions in state contribution rates—to state un employment funds Benefits were financed largely from employer contributions under state laws, which provided weekly payments to persons in approximately the same employments when they were out of work through no fault of their own Administrative costs of these state programs were paid from federal grants to states

Federal-state public assistance provided, under three separate programs (old age assistance, and to dependent children and aid to the blind), for federal grants in aid to states to meet part of the costs of monthly payments to needy aged persons, the needy blind and children deprived

of paiental support or care and part of the costs of administering these programs

Under three federal state programs for maternal and child welfare, federal grants in aid to the states met part of the costs of state programs for maternal and child health services, services for crippled children and child welface services.

Provisions for similar federal grants in aid to states for development and expansion of their programs for voca tional rehabilitation and for public health services first incorporated in the Social Security act were embodied in separate federal laws enacted in 1943 and 1941 respec tively Other provisions for regular insurance payments or related income to persons who had acquired rightsthrough employment or earnings—to retirement disability or unemployment benefits and sometimes benefits to then dependent survivors were established under separate pro grams for railroad workers war veterans federal employees and employees of some state and local governments and under workmen's compensation programs. General assist ance, financed without federal cooperation was made available as a form of public assistance in all states but was often meagre in rural areas

Table I indicates the changes in the amounts paid under public programs to provide continuing income to persons who acquired rights to social insurance and related bene fits and to those who qualified for public aid. The table also includes figures on the number of insurance bene ficiaries and recipients of public aid on the rolls of each program in June of the years 1937–45. Table II (p. 86) shows the aggregate wages and salaries in employments that carried social insurance or related protection under contributory retirement and unemployment insurance programs, it also indicates the amounts contributed to those programs and the assets of the trust funds through which such programs were financed

In 1937, at the opening of the decade, the Social Security act of 1935 still represented a new and virtually untried ex periment in the United States The Social Security board had begun to set up the machinery for a nation wide sys tem of old age insurance for industrial and commercial workers, and millions of persons had applied for and re ceived their 'social security account numbers' States sim ilarly had made preparations for administering their un employment insurance programs. The three federal state programs for old age assistance, aid to dependent children and aid to the blind were in operation in about two thirds of the 51 jurisdictions of the United States Acceptance of federal sharing in financial responsibility for continuing income to needy persons was only slowly gaining ground The public health and maternal and child health provi sions of the act, in contrast were in operation in all juris dictions, those for vocational rehabilitation in all but 2 while 45 jurisdictions received federal aid toward services for crippled children and for child welfare services

Early in 1937, decisions of the supreme court of the United States, by affirming the constitutionality of the in surance programs of the Social Security act, allayed fears that these new ventures in social insurance might be de clared inconsistent with the principles on which the nation was founded The Social Security board—established under that act—had already foreseen that the scope of the act would need expansion Working with an advisory council appointed with the co-operation of the senate committee on finance, the board had begun to study ways to strengthen the social security program

President Franklin D Roosevelt, the Social Security board and many other persons and organizations were

concerned about the limited coverage of the insurance programs, which excluded agricultural labour, domestic service, employment by private nonprofit and governmental agencies, maritime service and self-employment, types of service for which little or no insurance protection was afforded under other public measures. They were concerned also with the low levels of benefits and the lack of adequate protection against the risks of disability and death of the family wage earner, the wide variations among states in adequacy of unemployment insurance provisions, and the meagre provisions which some of the states and localities could afford to make for public assistance to needy persons and for health and welfare services.

Old-age, Survivor, and Disability Insurance.—Significant changes were made in the old-age insurance program by the Social Security act amendments of 1939. Following closely the recommendations of the Advisory council, whose report was issued at the close of 1938, the program was revised to begin monthly benefit payments in 1940, rather than in 1942, to provide supplementary benefits to dependents of retired workers and monthly survivor benefits to survivors of deceased workers, to increase the amount of benefits payable in the early years of the system and to permit workers to acquire wage credits after the age of 65. The amendments also repealed provisions for lump-sum payments to workers at the age of 65, established the old-age and survivors insurance trust fund to take over the assets of the old-age reserve account and provided for automatic appropriation to that fund of all employer and employee contributions toward financing the program.

Recommendations for wide extension of the coverage of the program were not adopted, however, and the employer and employee contribution rates were kept at 1% each until 1943, when rates were to double. This scheduled increase was later postponed, however, each year that it became imminent. In 1944, congress authorized the appropriation of federal funds to the old-age and survivors insurance trust fund of any additional amounts which might be needed to finance future benefits, and the house com-

mittee on ways and means was authorized to make a thorough study of financial and other provisions of the pro-

Relatively little additional change was made in the oldage and survivors insurance program until 1946. Early in that year, the technical staff appointed by the house committee on ways and means published its report, "Issues in Social Security," covering a study of insurance and assistance programs under the Social Security act. Subsequently, the committee held prolonged hearings on these and other proposals for improving the social security system. The Social Security act amendments of 1946, which resulted from these hearings, were, however, relatively limited in scope. The contribution rates for old-age and survivors insurance were held at 1% each for workers and their employers through 1947. Provisions were enacted to give temporary protection under federal old-age and survivors insurance for survivors of certain veterans of World War II dying within three years after discharge from active service. The permanent changes effected by these amendments removed some of the anomalies and administrative complexities of the old-age and survivors insurance program.

During the decade, substantial changes were made in the Railroad Retirement act. Credits for military service were allowed under this program, as under the federal civilservice system, and the railroad act was amended in 1946 to provide higher contribution rates and more effective provisions for benefits to survivors of covered workers. The Federal Civil Service Retirement act was also amended, in 1942, to require higher contribution rates, provide higher and also deferred annuities and prohibit refunds of contributions to workers leaving with five or more contribution years to their credit.

Relatively little legislative action was taken in the decade to furnish protection against the risk of wage loss from disability. Rhode Island and California, in 1942 and 1946 respectively, enacted laws to provide cash sickness benefits to workers covered by their unemployment insurance programs, and in 1946 the Railroad Unemployment Insurance act was amended to include benefits during maternity and

sickness. The Social Security Act amendments of 1946 authorized the nine states that had deposited employee contributions in the unemployment trust fund to use that money to finance disability insurance benefits. More effective provisions for permanent disability were incorporated in the Railroad Retirement act amendments of 1946, and provisions for veterans were liberalized.

At the end of the decade, as at its beginning, public systems for retirement, survivor and disability insurance were lacking for agricultural, domestic, nonprofit and many governmental employees. Under the federal old-age and survivors insurance system, moreover, there was no provision for disability among industrial and commercial workers. Federal and state workmen's compensation laws provided temporary and permanent disability benefits, as well as survivor benefits, for workers suffering from industrial injury, but Mississippi had no such law, and the laws of most states covered industrial accident but not industrial disease.

Unemployment Insurance.—Before the end of 1937, the Social Security act had performed its initial function in unemployment insurance by stimulating all states and territories to enact laws which met the conditions for federal approval, but only one state, Wisconsin, had been collecting contributions long enough to pay benefits. By July 1939, all states were paying benefits, and the Railroad Unemployment Insurance act of 1938 was in full operation. In 1944, similar benefits were also available to unemployed veterans of World War II as federal unemployment allowances administered by states under the provisions of the Servicemen's Readjustment act of 1944. These three programs were an important aid to reconversion after fighting ceased in Europe and the far east; they provided millions of dollars in benefits to workers who were unemployed while the economy was readjusting to peacetime activities -a resource that was wholly lacking in the reconversion process that followed World War I.

A system of unemployment insurance, co-ordinated with employment services, offered the best available method of giving an unemployed worker a chance of re-employment and—if no suitable job was available—a weekly income based on his former wages. Funds were systematically collected through employer (and sometimes employee) contributions to finance these payments.

During the last months of 1937, employment had begun to decline; in Jan. 1938, when 22 states began to pay benefits, they were faced with the difficulties of inaugurating a new program and processing a heavy load of claims. Except for this initial period of recession in late 1937 and early 1938, the trend in employment was upward for several years, and more and more workers acquired wage credits in employments covered by state laws. It was not until Sept. 1945, after the capitulation of Japan, that large numbers of insured workers began to claim their rights to benefits under state laws, and demobilized servicemen availed themselves of their unemployment allowances while they were readjusting to civilian life.

The system of public employment offices, which was under state control through 1941, with federal grants-in-aid under the Wagner-Peyser act of 1933, was turned over to the federal government on Jan. 1, 1942, at the president's request, made to state governors almost immediately after the United States entered World War II.

In July 1939, under a reorganization plan which placed the Social Security board in the newly established Federal Security agency, responsibilities for the U.S. Employment service and for federal grants toward state employment services had been transferred from the department of labour to the Social Security board for integration with its functions in federal-state unemployment insurance. Shortly after the War Manpower commission was established, that office became responsible for all public employment offices, a responsibility carried until the commission was abolished in the autumn of 1945. The employment services were then administered by the labour department, which on Nov. 15, 1946, turned over to the states the facilities and functions they had relinquished during the war emergency. The labour department retained responsibility for the United States Employment service and for federal grants to states.

Additional federal aid to states for their employment services was made available under the Social Security act through federal grants covering costs of the unemployment insurance functions of public employment offices in taking claims for unemployment benefits, finding jobs for insured unemployed workers and certifying their availability for work.

Changes in federal provisions for unemployment insurance under the Social Security act were minor during the decade; in the Social Security act amendments of 1939, higher amounts were authorized for federal grants to states for administering their programs, and establishment and maintenance of merit systems for state employment security personnel were made conditions for receipt of these grants.

In 1939, and with increasing urgency in subsequent years, the Social Security board recommended wider coverage of state unemployment insurance programs, minimum benefit standards as a condition of federal approval, repeal or modification of experience-rating provisions and establishment of special provisions for maritime workers and federal employees. Although many of these proposals were presented in congressional hearings that preceded the Social Security act amendments of 1939 and 1946, relatively little was done to change the federal provisions first effective in 1935.

The decade produced important federal legislation for servicemen and railroad and maritime workers, but there was no federal legislation to enhance the unemployment benefit rights of workers covered by state laws or to lessen the variations among states in adequacy of provisions and interpretation of these provisions. The War Mobilization and Reconversion act of 1944 authorized, until July 1, 1947, advances to state unemployment funds when these funds approached insolvency, but because each state account in the unemployment trust fund had large surpluses of deposits over withdrawals for benefit payments, this provision was inoperative.

States, however, made significant changes in their laws during the decade. At the end of 1937, 29 states, with about half the covered workers in the United States, restricted their coverage to employers with eight or more workers-the coverage of the federal tax against which employer contributions to state unemployment funds were credited-and only 10, with less than one-eighth of the covered population, had no size-of-firm restriction. By the middle of 1945, 16 states, with nearly a third of the covered population, had no size-of-firm restriction, and only 22, with about a third of the covered workers, limited their coverage to firms with eight or more workers. No major changes were made, however, in extending coverage to agriculture, domestic service, nonprofit organizations or other types of employment excluded from the federal tax. The Social Security act amendments of 1946 authorized states to cover maritime workers in intercoastal shipping. The supreme court had declared in May 1943 that there were no constitutional barriers against such state coverage. These amendments also authorized a temporary federal program of reconversion benefits for seamen employed by agents of the War Shipping administration, somewhat like that for veterans, but no funds were appropriated to start operations in 1946.

During the decade, many states also greatly liberalized their benefit provisions. At the end of 1945, one state (Maryland) had abolished its waiting period and 35 required only one week; at the end of 1937, all states required a waiting period of two or more weeks before a worker could receive benefits. In 1937, the maximum weekly benefit amount was \$15 in 49 jurisdictions which accounted for all but 5% of the covered workers; by the end of 1945, the maximum was \$15 in only 10 states, 6 states with about one-tenth of the covered population had maximums of \$24-\$28 and 4 states made provisions for allowances to an unemployed worker's dependents. In view of the high wages and steady employment of the war years, however, these maximums represented less than half of customary weekly wages for the majority of beneficiaries under state laws.

The maximum duration of benefits was also liberalized. In 1937, no matter how long an insured worker was unemployed, his benefits ceased in all but 6 states after he had received benefits for as much as 16 weeks; by the end of 1945, half the covered workers were in the 11 states which paid benefits for as much as 21–26 weeks. In 1937 only one state provided for uniform duration of benefits for all workers; by 1945 the number was 14.

The trend toward increasing severity of disqualifications from benefits ran counter to these liberal tendencies, however. These severe disqualifications meant that more than half the states cancelled a worker's wage credits or reduced his benefit rights if he was disqualified because of quitting his job voluntarily without good cause, discharge for misconduct or refusal of suitable work. Other states postponed his benefits for several weeks, but considered his unemployment involuntary after the specified period had elapsed.

Experience-rating provisions were effective in all but 6

states by the end of 1946. During the war years, 12 states, fearful of postwar drains on their unemployment funds, required special war-risk contributions, which came principally from employers with large-scale war production.

Public Assistance and Other Aid.—The major proposals of the decade for strengthening the provisions for federal aid to states for assistance to needy persons stressed the need for federal sharing in general assistance, for special federal aid to low-income states, for raising or removing the limits set in the Social Security act on federal matching maximums for individual payments and for federal participation in medical assistance. Federal legislative changes in the ten years were relatively slight, however, and in some instances temporary.

The 1939 amendments to the Social Security act made establishment and maintenance of merit systems for state public assistance personnel a condition for receipt of federal grants for each of three assistance programs and provided that, in determining recipients' need, account should be taken of their resources. The federal contribution was increased for all three programs. The 1946 amendments, for a 15-month period beginning Oct. 1946, increased the federal participation in assistance still further.

Significant changes were made in state programs, however. The number of states receiving federal funds increased in the decade to nation-wide dimensions for oldage assistance, to all but one (Nevada) for aid to dependent children, and all but four (Alaska, Missouri, Nevada and Pennsylvania) for aid to the blind. Many states progressively liberalized their eligibility requirements and raised or eliminated their maximums on individual payments. They gave fuller recognition to the requirements of assistance recipients, including medical needs, and to increases in the cost of living, and, within the limitations of available funds, made assistance more nearly commensurate with need and more nearly uniform throughout the state. During the decade, assistance became increasingly a matter of right, and the concept of the unrestricted money payment, to be spent as the recipient deemed best, acquired widespread acceptance.

By July 1943 the federal work programs established in the depression years had all been liquidated, leaving oldage assistance, aid to dependent children, aid to the blind and general assistance as the only forms of public aid. The assistance rolls of each of these programs declined during the war years of full employment and high wages. In the war period, economic security was greatly enhanced by increased resources of relatives, federal allowances to dependents of servicemen and even by earnings of old and disabled persons, housewives and young children.

Upturns in the assistance rolls started in the autumn of 1945 and were accelerated in the reconversion period, with increases in the number of unemployed workers and demobilized servicemen. Social insurance rights, however, were an important resource of many persons who might otherwise have had to apply for assistance.

Health, Welfare and Medical Services.—As compared with the development of nation-wide measures for old-age insurance and assistance, progress in the application of insurance principles and pooling national resources for health was slow. As early as 1938, a National Health conference technical subcommittee on medical care issued a report on a national health program, recommending a system of public medical care for the medically needy and consideration of a program of medical care for the entire population, to be supported by general taxation or insur-

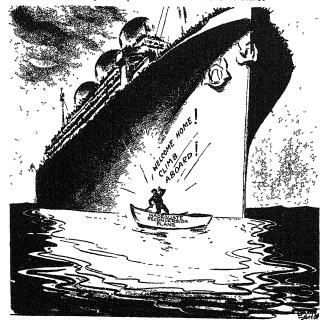

ance payments or a combination of both. In Jan. 1939, President Roosevelt sent congress the report of the Interdepartmental Committee to Co-ordinate Health and Welfare Activities, which urged use of federal grants to expand and strengthen general state services for public health and maternal and child health and to develop needed hospital facilities and state programs for medical care. In the Social Security act amendments of 1939, larger amounts were authorized for federal grants for child health and welfare, and the provisions for these programs were extended to Puerto Rico.

The Social Security act amendments of 1946 authorized increases in federal grants for maternal and child health, services for crippled children and child welfare services, and included the Virgin Islands among the jurisdictions eligible for funds under these programs. Other federal legislation in 1946 made permanent earlier provisions for a school program and authorized federal aid in a nation-wide program for construction of hospitals and medical centres. Insurance against medical costs, however, remained available on a voluntary and limited basis only.

War Emergency Programs.-In Feb. 1942, the Federal Security agency was authorized to establish emergency benefit and assistance programs financed from emergency funds for certain civilians. Under this and subsequent authorizations, the Social Security board initiated a program of civilian war benefits providing disability and survivor benefits and a program of civilian war assistance to provide assistance of short duration to meet emergency need resulting from enemy attack or action to meet such attack or the danger thereof, and the U.S. public health service provided medical service benefits. In addition, the Social Security board established a program of aid to enemy aliens and other persons in need because of the restrictive action of the federal government. The two assistance programs, although financed entirely from federal funds, were administered by state public assistance agen-

On March 18, 1943, federal funds were authorized for a wartime program of maternity and infant care for wives

"G.I. Joe Wants More Than a Rowboat." The need for planned reconversion to insure postwar employment after demobilization, as seen by Bishop of the St. Louis Star-Times

and children of the enlisted personnel of the armed forces, to be administered by states under the supervision of the U.S. children's bureau.

By July 1946, the program for enemy aliens had been terminated. Acceptance of new claims for civilian war benefits was discontinued in July 1945. This program and civilian war assistance were of special significance for U.S. citizens repatriated from Europe and the far east and for civilians who had been interned in enemy prison camps.

Program Developments.—At the start of the decade 1937–46 relatively few persons had any rights to immediate benefits under social insurance, and many had never recovered their earning capacity after the devastating years of the depression. States were struggling to raise the funds which would bring in matching federal dollars for the public assistance programs under the Social Security act and, in the meantime, were carrying heavy loads for general assistance to persons who could not be shifted to the roll of old-age assistance, aid to dependent children or aid to the blind.

As the old-age and survivors insurance program developed, more and more workers reached the age of 65 with rights to continuing monthly benefits as retirement income for themselves, their aged wives and their young children. In June 1946, for example, some 193,240 retired workers whose wives received supplementary benefits had an average family benefit of \$38.80 a month under this program; so similar income protection was available to these industrial and commercial workers before 1940. At the beginning of 1946, about 41,500,000 living workers had acquired insured status under old-age and survivors insurance. The survivorship rights acquired under this program over the decade had built up to the equivalent of more than \$50,000,000,000 in term life insurance. In June 1946, the average monthly amount paid to widows of deceased insured workers with young children in their care was \$51.00 for a family with three or more child beneficiaries. Table III indicates the number of workers with wage credits under the program in successive years, the number of living workers with insured status under the program at the beginning of the year and the amount paid as retirement and survivor benefits, including lump-sum death payments.

Table III.—U.S. Workers with Social Security Wage Credits

	Workers with	Insured living	Payments certified in year to:			
Year	wage credits in year	workers at beginning of year	Living workers and their dependents	Survivors of estates of deceased workers		
1937	32.904.000		\$651,000	\$627,000		
1938	31.822,000		4,706,000	<i>5,77</i> 2,000		
1939	33,751,000		4,575,000	9,321,000		
1940	35,393,000	22,900,000	21,074,000	19,520,000		
1941	40.976.000	24,900,000	55,141,000	38,783,000		
1942	46,363,000	27,500,000	80,305,000	56,740,000		
1943	47,656,000	31,200,000	97,257,000	75,593,000		
1944	46,296,000	34,900,000	119,009,000	99,088,000		
1945	45,696,000	38,400,000	157,391,000	130,366,000		

In June 1946, the total number of beneficiaries of oldage and survivors insurance—retired workers, their aged wives and aged widows and aged parents of deceased workers—comprised nearly one-tenth of the estimated 10,400,000 persons in the population aged 65 and over. Perhaps an additional 6% received old-age benefits under related public programs, while one-fifth received old-age assistance. In June 1940, there were 25 recipients of old-age assistance for every aged beneficiary of old-age and survivors insurance, while 6 years later there were only 2.

For aged persons, public assistance by 1946 constituted a more important source of support than social insurance and related programs. For surviving dependents under age 65, social insurance was probably more important than public assistance.

Among fatherless children, about two were receiving social insurance and related benefits at the end of 1945 for every one receiving public assistance.

Somewhat similar relations appeared between unemployment insurance and public aid. Unemployment benefits paid under state laws, the railroad program and the Servicemen's Readjustment act greatly diminished the need for assistance and federal work programs. Table IV shows the number of workers who acquired wage credits under state unemployment insurance programs, the number of beneficiaries and of weeks compensated and the number of initial claims filed (the number of different workers claiming benefits) for each year for which comparable data were available:

Table IV.—Statistics of State Unemployment Insurance

Year	Workers with wage credits in year	Beneficiaries in year	Weeks of un- employment compensated in year	Initial claims for benefits in year
1938	*	*	38,076,000	9.565,000
1939	30,086,000	*	41,554,000	9,765,000
1940	31,947,000	5,220,000	51,084,000	11,140,000
1941	37,600,000	3,439,000	32,295,000	8,527,000
1942	43,400,000	2,815,000	28,158,000	6,324,000
1943	44,000,000	664,000	6,004,000	1,884,000
1944	43,000,000	533,000	4,124,000	1,503,000
1945	42,500,000	2,830,000	24,038,000	6,030,000

*Not available.

After V-J day, unemployment rose steadily with the stoppage of war production and demobilization of the armed forces. The peak level of unemployment (2,700,000) reached in March 1946, was about three times the extremely low level in Aug. 1945. In the 12-month period, Sept. 1945-Aug. 1946, a total of nearly \$2,455,000,000 was paid as unemployment benefits under state laws and the programs for railroad workers and veterans brought the total paid under social insurance and related programs to \$5,618,000,000, or more than five times the total (\$1,020,-000,000) for the calendar year 1937. Mainly because employment and earnings remained relatively high after the war, and because federal allowances to dependents of serv-icemen and subsistence allowances to veterans under the Servicemen's Readjustment act represented a substantial federal contribution (\$2,046,000,000) to income maintenance, the total spent as public aid in the 12 months following V-J day aggregated only \$1,095,000,000, or less than half the total for federal work program earnings and public assistance payments in 1937. Payments under social insurance and related programs, moreover, played a significant and increasingly important part in reducing the need for public assistance and employment on federal work programs.

The progress of public assistance under the Social Security act is indicated in Table V.

Table V.—Number of States and Territories Participating in Federal Funds
Under the Social Security Act

Year	All three assist- ance programs	Old-age assistance	Aid to depend- ent children	Aid to the blind
1937	36	50	39	37
1938	38	51	42	42
1939	39	51	42	43
1940	40	51	43	43
1941	43	51	47	44
1942	43	51	47	45
1943	45	51	48	46
1944	46	51	49	46
1945	47	51	50	47

General assistance, the residual program which provided for needy persons failing to meet qualifications for the special types of assistance, was still financed by states and localities without federal aid. (A. J. A.)

Great Britain

During 1937, large-scale unemployment continued to be the most formidable problem of its kind ever experienced in Great Britain. As many of the 1,700,000 unemployed had been without work for periods of years, the problem of their welfare and adequate maintenance was one of progressively increasing difficulty. Responsibility for this rested largely on the unemployment assistance board, which provided allowances from state funds to those who had either exhausted their title to unemployment insurance benefit or who had not acquired a title to such benefit. During the year the number of applications for allowances to the unemployment assistance board was about 1,250,-000, and in Dec. 1937 there were nearly 600,000 applicants for assistance, representing the needs of about 2,000,000 persons. The annual expenditure on unemployment assistance allowances was £36,740,000 and on unemployment insurance benefits £33,160,000, a combined total of £69,800,ooo devoted entirely to the maintenance of those out of work.

National Administration.—In the more restricted sphere of improved security measures for the long-term unemployed, the most important development was the assumption in 1937 of full powers by the unemployment assistance board. This board had been created by the Unemployment act of 1934 to take over, in one department of the central government, a responsibility which had previously been placed on local government. This transfer from local to central administration had been arranged in two stages; the first stage, which was carried out early in 1935, was confined to those who were insurable under the unemployment insurance scheme, and had involved the newly created board in the considerable first task of taking over from about 200 local authorities responsibility for the needs of about 800,000 unemployed, who with their dependents represented about 2,500,000 persons. The second stage was delayed until April 1937, when the unemployment assistance board assumed responsibility for the remaining unemployed whose occupations were not embraced by the unemployment insurance scheme, but who had normal occupations insurable under the wider scope of the Contributory Pensions acts, such as domestic service and similar private employment. This second stage involved the transfer of approximately 90,000 persons, and so completed the change-over to direct national responsibility. With this began a great and significant change in the history of British social administration, and a further stage in the break up of the old locally-administered Poor law which had survived in much the same form since Elizabethan times. The general structure of the Poor law remained, but the responsibilities of the local authorities were now restricted to the care of the needy aged, the sick and destitute and those normally self-employed.

The year 1938 was marked by many difficulties and uncertainties arising from the threat of war; the upward trend in employment was not maintained and the number of unemployed increased until at the end of December the total was more than 1,830,000. Applications to the unemployment assistance board were again in the region of 1,250,000, of which about 445,000 were from persons who had not previously applied for such assistance. The total expenditure on unemployment allowances was £39,297,000, an increase of £2,557,000 more than the previous year, and on unemployment insurance benefit £51,622,000, an increase of £18,462,000. The increased expenditure on

unemployment insurance benefit was largely the result of the Unemployment Insurance act of 1938, which extended the range of insurance to those in domestic service and similar employment, and also made certain increases in the rates of benefit for dependents and for the younger claimants under the agricultural part of the insurance scheme

The unemployment assistance board became increasingly concerned with the problem of prolonged unemployment among the younger applicants for assistance, which showed evidence of being more a problem of the individual than a problem of industry. Exceptional methods were devised to ensure that as many as possible in the younger age groups were specially interviewed and individually advised on their prospects of employment or suitable training

Rearmament and War .- The expanding rearmament program which was soon to be followed by the outbreak of World War II had early and appreciable effects on the unemployment problem. The general change-over from a peace to a war economy was necessarily slow and caused dislocations of industry and employment which at first offset gains in other directions. Under the pressure of wartime demands for labour of every kind, however, the longstanding problem of mass unemployment rapidly diminished, and by the end of 1940 had ceased to be a social problem of any consequence. Some new social complications emerged in the changed conditions of war, such as the influx of refugees from abroad, the large-scale evacuation of sections of the civil population from vulnerable areas, the loss of employment or incomes caused by the cessation of certain industries and the flow of private funds from other countries. This situation had been anticipated to a large extent and was met by the provisions of the Unemployment Assistance (Emergency Powers) act of 1939, which was administered by the unemployment assistance board and came into operation soon after war was declared.

By this act the unemployment assistance scheme was extended to provide for the needs of certain classes of persons, including refugees from abroad, who were in distress as a result of the war. Fortunately the extent of such distress never assumed the proportions which had been anticipated; the largest number of such allowances in payment at any one time was 48,000. The scheme continued in operation and in 1946 seemed likely to do so as long as distress attributable to the war remained, or until a comprehensive scheme of state assistance should be evolved.

The more general and most pressing social consequence of the war was a rapid increase in the cost of living, the government index figure of which rose from 55 in Sept. 1939 to 87 in Sept. 1940. This increase was largely offset by a general rise in wage levels, but soon began to cause hardship among a large number of old-age pensioners who were in the main dependent on the small fixed pensions paid under the state insurance schemes. Those who found such pensions insufficient for their needs had normally no alternative but recourse to the locally administered Poor law, funded mainly from local taxation, and the steadily increasing numbers who were forced to seek such relief greatly increased the financial burdens of many local authorities at a time when they were least able to sustain them.

The government consequently decided to relieve the local authorities of such additional charges and also at the same time to improve the condition of the aged by transferring the whole responsibility for the additional needs of old age-pensioners to the exchequer. This decision was implemented by the Old-Age and Widows' Pensions act of 1940, which, in addition to lowering from 65 to 60 the age at which contributory old-age pensions were payable to

Poster in the bombed centre of Bristol, Eng., before the parliamentary by-election of Feb. 1943, in which Jenny Lee was a candidate. The Beveridge plan for social security was a key issue throughout the campaign

women, made the unemployment assistance board, under the changed name of the assistance board, responsible for the new scheme of supplementary pensions introduced by the act. The scheme provided that, subject to a test of need, the income of the pensioner and his or her dependents should be brought up to standards approved by parliament.

Prior to the operation of this act, some 275,000 old-age pensioners had been receiving assistance under the Poor law, at a total annual cost to the local authorities of about £5,000,000. Within three months of the introduction of the state scheme the number of supplementary pensioners had reached nearly 1,000,000, at a total annual cost to the exchequer in 1941—the first full year of operation—of more than £25,000,000. By the end of 1945 the number of supplementary pensioners had risen to more than 1,600,000, at a total annual cost of about £59,000,000.

The assistance board had thus become responsible for the needs and welfare of a much larger section of the community than it had been brought into being to deal with under the unemployment assistance scheme and had become the largest single welfare service in British history. In 1943 the board's responsibilities were further extended by the Determination of Needs act, by which the scheme of supplementary pensions was widened to include widow pensioners of less than 60 years of age who had an allowance for dependent children included in their pension.

Beveridge Report.—The Unemployment act of 1940 provided for certain increases in the rates of contributions and benefit for those more than 15 years of age and extended unemployment insurance to nonmanual workers earning up to £420 a year, but there still remained many inequalities both in the methods of payment and in the amounts which were provided either directly or indirectly from state

funos to provide against economic insecurity. Despite the preoccupations and perplexities of war, the government had under consideration the necessity for a comprehensive survey of all of the state insurance and allied services, which had long been felt to be overdue. In June 1941 an interdepartmental committee was formed under the chairmanship of Sir William Beveridge (later Lord Beveridge) to undertake this task, but for reasons of policy the findings of this committee were published in 1942 as a personal report by Sir William Beveridge and were universally referred to as the Beveridge report. This recommended the amalgamation of all the state insurance schemes into a single unified system under the control of a minister of social insurance.

The main features of the plan were universal social insurance against the interruption or destruction of earning power, and for special expenditure arising at birth, marriage or death, embodying six fundamental principles: flat rate of subsistence benefit, flat rate of contribution, unification of administrative responsibility, adequacy of benefit, comprehensiveness, and classification. These, in combination with national assistance and voluntary insurance as subsidiary methods, would ensure freedom from want in any circumstances and remove for all time one of the fundamental defects of the social system. As a corollary of the insurance arrangements the report recommended the organization of a complete national health service which would be free and available to all.

The government accepted the general principles of the plan and in 1944 presented legislative proposals to parliament in three White Papers, one on a national health service, one on the general provisions for social insurance and one on the special provisions for workmen's compensation. The health proposals envisaged a complete state system of health and medical services controlled by the minister of health, assisted by a central medical board, and health centres established throughout the country by the

local government authorities according to population requirements, the centres to be based on a system of grouped medical practice closely linked with improved and extended specialist, nursing, hospital, sanatoria and rehabilitation services. With some slight modifications, the social insurance proposals closely followed those of the Beveridge report, including sickness and unemployment benefit, retirement pensions, maternity benefit, widow's benefit and pensions, family allowances and national assistance, but proposed to deal with workmen's compensation as a separate fund with a separate range of benefits apart from the general scheme of social insurance.

National Insurance Legislation.-The first step towards giving effect to these proposals was the Ministry of National Insurance act of Nov. 1944, which established a minister of national insurance (parliament preferred this title to that of minister of social insurance which had been suggested in the Beveridge report) and transferred to the new minister responsibility for all matters relating to national health insurance, old-age pensions, widows', orphans' and old-age contributory pensions, supplementary pensions, unemployment insurance and unemployment assistance, and workmen's compensation. The first instalment of the comprehensive social security scheme was contained in the Family Allowance act of 1945, which became operative in Aug. 1946. This provided for payment to every family which included two or more children, and for the benefit of the family as a whole, an allowance of five shillings a week for each child after the first, to continue generally until the eligible children were 16 years of age. The allowances were inalienable and of universal application; there were no exceptions.

It was estimated that in the first full year of operation some 2,000,000 families would receive allowances at a cost to the exchequer of about £57,000,000. The National Insurance bill and the National Insurance (Industrial Injuries) bill were introduced in 1945 and passed by parliament in Aug. 1946, but their main provisions were not to become operative until dates to be fixed by the minister of national insurance. Both acts embodied the main principles set out in the White Papers which preceded them. The main clauses of the National Insurance bill provided for the division of the population into three insurance classes: persons employed under contract, self-employed persons and nonemployed persons, with separate contribution rates for each class, contributions by employers and additions by the exchequer.

The main points were: title to benefits to be dependent on a prescribed number of contributions; employed persons to qualify for sickness and unemployed benefit, selfemployed for sickness benefit only; indefinite sickness benefit, unemployment benefit normally to be limited to 180 days, but the period might in individual cases be extended; maternity grant to be made for each child born, maternity allowances for employed women to be paid for 13 weeks before and after confinement, attendance allowances for four weeks to other women; widows' allowances with additions for children of school age to be made for 13 weeks, followed by widowed mother's allowance and subsequent widow's pension, conditional on age and ten years of marriage or physical infirmity, with retirement pension if husband was so entitled; guardians' allowances for orphan children to be made; retirement pensions for life at age of 65 (women 60), increased pensions for postponed retirement at more than 70 (women 65) to be paid without retirement condition; death grants to be made in respect of

an insured person, his wife, child or dependent.

Although the scheme would probably not come into operation until 1948, the government decided as an exceptional measure that the section of the act which related to retirement and old-age pensions should come into effect from Oct. 1946. The general effect of this decision was that such pensioners received payment at the higher rates provided for in the act; for example, the joint pension of a man and wife insured in the husband's right was increased from 20s. to 42s., single persons' pensions were increased from 10s. to 26s. and such increased pensions could, il necessary, be supplemented under the existing scheme of supplementary pensions administered by the assistance board. The main provisions of the National Insurance (Industrial Injuries) act established this as a separate insurance fund with separate rates of contributions and separate benefits. Broadly the scheme would apply to all persons working under a contract of service without income limit or provisions for contracting out. Contributions were to be paid jointly by the insured persons and their employers, with an additional contribution from the exchequer equal to one-fifth of the joint contributions. The principal benefits would be as follows: injury allowances for first 26 weeks of incapacity, followed by disablement pensions if incapable of work or if permanent disability was suffered, amount of pension being assessed according to degree of disability; dependent's allowance for wife, child or adult dependent; rates of benefit the same for men or women; pensions in fatal cases for widows or adult dependents with allowances for children; the scheme was to be extended to certain industrial diseases to be prescribed by the minister.

The National Health Services act, passed in Oct. 1946, did not differ in any important particular in its general principles from the proposals in the government's White Paper of 1944, except that it was proposed that all hospitals should be brought under national ownership. There was, however, general recognition that effective planning and co-ordination of the hospital services was inseparable from ownership, with the exception of the teaching hospitals attached to the universities. A similar service was to be provided in Scotland under the terms of the National Health Services (Scotland) bill.

When these measures were in operation all of the various state social services would be transformed into one universal and comprehensive system of social security without precedent elsewhere, firmly establishing the social policy envisaged by Beveridge of a national minimum income adequate to the subsistence needs of every family and designed with the twofold purpose of providing social security for everybody and an equivalent increase in national productive efficiency. (See also LAW; Relief.)

BIBLIOGRAPHY.—Reports of the Ministry of Labour (Cmd. 5,717, 1937), (Cmd. 6,016, 1938); Reports of the Unemployment Assistance Board (Cmd. 5,752, 1937), (Cmd. 6,021, 1938), and Reports of the Assistance Board (Cmd. 6,700, 1944), (Cmd. 6,883, 1945); Sir William Beveridge, Report on Social Insurance and Allied Services (Cmd. 6,404, 1942), and Memoranda from Organizations (Cmd. 6,405, 1942); Government White Papers on A National Health Service (Cmd. 6,502, 1944); Social Insurance, Part 1 (Cmd. 6,550, 1944), Part 2 Workmen's Compensation (Cmd. 6,551, 1944); Summary of Main Provisions of the National Insurance Scheme (Cmd. 6,729, 1946); National Insurance Infusional Insurance (Industrial Injuries) Bill, Explanatory Memorandum (Cmd. 6,651 1945); National Insurance Act, 1946; National Insurance (Industrial Injuries) Act, 1946.

Social Service

Societies and Associations

Following is a listing of prominent societies associations, foundations and other organizations in the United States, Great Britain and Canada

American Academy of Arts and Letters.-The American Academy of Arts and Letters was founded in 1904 by the National Institute of Arts and Letters for the furtherance of literature and fine arts. Membership of the academy was limited to 50, chosen only from members of the institute The following persons were elected to the academy during the 1937-46 decade 1937, Charles McLean Andrews, Van Wyck Brooks, Bernard Berenson, Frederick Converse William Adams Delano, Sinclair Lewis Jonas Lie Herbeit Putnam, Albert Spalding Chauncey Brewster Tinker Charles Warren; 1938, Stephen Vincent Benet, Willi Cather, Ellen Glasgow, Thornton Wilder, 1939 no elec tions, 1940, Ralph Adams Cram, Edna St Vincent Mil lay, Carl Sandburg, Henry O Taylor, 1941, Paul P Cret Charles Hopkinson, Agnes Repplier, 1942, John Alden Carpenter, Barry Faulkner, Henry R Shepley, John Sloan Eugene Speicher, 1943, Gifford Beal, Ernest Bloch John Marin, Frederick L. Olmsted, Edward W Redfield 1944, Edward McCartan, 1945, Douglas Southall Freeman, Robinson Jeffers, Lee Lawrie, 1946, Charles Austin Beard, Gilmore D Clarke, Archibald MacLeish

The academy made the following awards during the 1937-46 decade Gold Medal of the Academy conferred in recognition of special distinction in literature art or music was awarded to Ernest Bloch in 1942 Howells Medal of the Academy, given every fifth year in recogni tion of the most distinguished work of US fiction pub lished during that period, was awarded to Ellen Glasgow in 1940 and to Booth Tarkington in 1945 Diction Medal of the Academy, to be conferred at any time to any man or woman for good diction on the US stage, was given to Paul Robeson in 1944 and to Eva La Gallienne in 1945, Award of Ment Medal, accompanied by a cash prize and given to a highly outstanding person in the US representing painting, sculpture, novel, poetry and drama, was conferred upon Charles Burchfield (1942) Carl Milles (1943), Theodore Dreiser (1944) and Wystan Hugh Auden (1945) Between 1942 and 1946, the Ameri can Academy of Arts and Letters and the National Institute of Arts and Letters gave a number of \$1,000 grants to persons for work in art, literature and music

Officers of the academy (1946) were Walter Damrosch president, James Truslow Adams, chancellor and treas urer, Van Wyck Brooks, secretary Offices of the academy 633 W 155th St., New York 32, N Y

American Academy of Arts and Sciences.—Founded in Massachusetts in 1780, the American Academy of Arts and Sciences devoted itself primarly to "the cultivation and diffusion of the arts and sciences for the wealth, peace, independence and happiness of the people"

The academy, whose membership of 800 fellows and 130 foreign honourary members in 1946 represented the various sciences, the arts and humanities, continued to meet 8 times annually and on special occasions to receive and discuss communications from members or guests.

For the encouragement of research, particularly in the sciences, the academy continued to award grants in aid in various fields. From the Rumford fund it awarded from time to time, the gold and silver Rumford medals and the Rumford premium for high achievement in the fields of heat and light. In the decade 1937–46 these awards were conferred on William W. Coblentz, George R. Harrison Vladimir K. Zworykin and Charles E. K. Mees

In recognition of high achievement in certain fields of medicine, it continued to award septennially the Frances Amory prize In 1941 this award of \$17,000 was conferred jointly upon Dr. Hugh H Young, Dr. Joseph F McCarthy, Dr. Carl R. Moore and Dr. Ernest Laqueur.

Publications the *Proceedings*, scholarly and scientific papers, memoirs and special volumes Noteworthy among these were the *Monumenta Paleographica Vetera Series I*, dated Greek minuscule manuscripts to the year 1200 edited by Kirsopp Lake and Silva Lake in 10 fasciculi

The officers (1946-47) were president, Howard Mum lord Jones, vice presidents, R G D Richardson, J W. M Bunker, E N Griswold and Donald Scott, corresponding secretary, J W. M Bunker, recording secretary, I. Amdur, treasurer, H S Ford, librarian, F H Pratt, and editor, Taylor Starck. Headquarters 28 Newbury St, Boston, Mass

American Academy of Political and Social Science .-Founded in 1889 to provide a forum for discussion of political, social and economic problems, the academy had a membership of slightly more than 12 000 in 1946 Pub lications included the Annals, a bimonthly magazine, and occasional monographs and pamphlets Among some of its better known pamphlets were Democracy Versus the Totalitarian State in Latin America by Samuel Guy In man (1938), European Plans for a World Order by Wil liam P Maddox (1940) and The Core of a Continent Problems of Central and Eastern Europe by Henryk Strasburger (1943) Officers (1946) president Ernest Minor Patterson, vice presidents Herbert Hoover C A Dykstra and Carl Kelsey secretary J P Lichtenberger und treasurer, Charles J Rhoads Headquarters 3457 Walnut St Philadelphia 4 Pa

American Association for the Advancement of Science. -A scientific organization whose membership increased from 11,547 in 1920 to more than 30 000 in 1946, the American Association for the Advancement of Science was organized in 1848 and had 200 affiliated and associated societies in 1946 The association continued to publish three journals, the AAAS Bulletin (monthly), Science (weekly journal) and the Scientific Monthly, in addition to technical and nontechnical symposia. The association's technical symposium began in 1938 with a volume en titled Tuberculosis and Leprosy and by 1946 contained 20 vol Two other volumes, Human Malana and Re lapsing Fever, were widely used during World War II by the US army and navy medical corps in the tropics Officers (1946) James B Conant, president, Forest Ray Moulton, administrative secretary, and William E Wrather, treasurer Headquarters 1515 Massachusetts Ave, Washington 5 DC

American Association of Law Libraries.—The association was founded in 1906 and incorporated in 1935 under the laws of the District of Columbia as a nonprofit organization designed to promote librarianship, develop and increase the usefulness of law libraries, and foster a spirit of cooperation among law libraries Publications Law Library Journal, a quarterly, and Index to Legal Periodicals, published monthly (except August) Officers for the 1946–47 period Laurie H Riggs, president Arie Poldervaart, president elect for 1947–48 Executive secretary and treas uner Mrs. Helen M S Helmle, Equitable Life Assurance Society of the US, 393 Seventh Ave, New York 1, NY

American Bankers Association.—A national organization to promote the general welfare of US banks, the ABA was founded in 1875, its 1946 membership embraced 96% of all US banks

In 1938 the ABA carried on a campaign against government subsidized credit where the latter allegedly was in unfair competition with chartered banks Educational activities continued to rank high among the ABA.'s activities, its projects along this line included the Ameri can Institute of Banking, offering study courses to banking employees, and graduate school of banking, offering annually two weeks of graduate studies at Rutgers university, New Brunswick, NJ, for bank officers During World War II, the ABA actively encouraged its membership to promote war bond drives. The association also engaged in protecting the interests of member banks with regard to federal legislation and continued to maintain a Washington office to represent the entire membership in matters pertaining to national legislation, rulings and regulations affecting banking operations.

Officers (1946-47) president, C W. Bailey vice president, Joseph M Dodge, treasurer, S Albert Phillips, secretary, Merle E. Selecman Headquarters 12 E 36th St, New York 16, NY

American Bar Association.—Organized in 1878 as a voluntary association of lawyers and jurists, the ABA defined its objectives to include the advancement of the science of jurisprudence and promotion of the administration of justice. Its membership as of Sept 1, 1946, was 37,303. During the 1937–46 decade, the association voiced vigorous opposition to President Roosevelt's plan to re organize the supreme court (1937) and voted for support of the Vandenberg amendment to the Child Labor act. The following year, the association devoted its attention to safeguarding civil liberties.

After the start of World War II, the ABA sponsored free legal aid to men in service and their families. The ABA, continued to grant an annual association medal for conspicuous service to US jurisprudence, the Ross prize of \$3,000 for an essay and the award of merit given to US, bar associations. Publications the American Bar Association Journal, a monthly, and an annual volume of reports and proceedings and various papers. Officers (1946) Carl B Rix, president, Joseph D Stecher, secretary, Walter M Bastian, treasurer. Headquarters. 1140 N. Dearborn St, Chicago, Ill

American Bible Society.-Founded in 1816 for the purpose of encouraging wider distribution of the Holy Scriptures, the American Bible society aided in translation, publication, distribution and use of the Bible, free of notes and comments The American Bible society continued to distribute annually about 7 000,000 volumes of the Holy Scriptures in the United States and about 3,000,000 in other lands. In co operation with bible societies in other lands and missionary organizations, the American Bible society aided in translation of the Scriptures into more than 1,000 languages After World War II, the society through its postwar emergency fund, devoted its efforts to furnishing free of cost about 2 500,000 new testaments and 100,000 bibles (all in the Japanese language) to Japan, and to supplying about 2,000,000 German bibles and new testaments to Germany It also continued to publish the Bible Society Record, an illustrated magazine issued 10 times yearly President of the society (1946) Daniel Burke Headquarters 450 Park Ave, New York 22, NY

American Chemical Society.—The American Chemical society was founded in 1876 to encourage the advancement of chemistry, improve the qualifications and usefulness of chemists, increase the diffusion of chemical knowledge and

promote scientific interests and inquiry. In the 1937-46 decade membership more than doubled In 1946 mem bers totalled 48 000, while in 1938 its membership was slightly more than 22,000

The organization continued to award predoctoral and postdoctoral fellowships as well as specific annual awards to individual chemists for outstanding work in their fields Among the more prominent recipients during the 1937–46 decade were G. N. Lewis, who received the Richards medal in 1938, and James B. Conant, who was awarded the Priestley medal in 1944

Publications: Chemical Abstracts, Journal of the American Chemical Society, Chemical and Engineering News, Industrial and Engineering Chemistry (industrial edition) and Analytical Chemistry During World War II many of the pages of these journals were devoted largely to presenting information needed by chemists

Officers (1946) Bradley Dewey, president, W. Albert Noyes, Jr, president elect Roger Adams, chairman of the board of directors, Alden H Emery, secretary, and Robert Baldwin, treasurer Headquarters 1155 16th St NW, Washington 6, DC

American College of Life Underwriters.-This college grew out of the needs for efficient life underwriting and was incorporated in 1927 with the object of training students and establishing standards for the profession. It also co operated with universities and colleges promoted research and preparation of textbooks. The college be came associated with the American Society of Chartered Life Underwriters, with chapters in 58 cities and associa tions with 19 insurance firms in 1946. At the end of 1946 there were 2,599 persons who had received the Chartered Life Underwriter designation To receive the CLU award, candidates had to pass 5 written examinations which in 1946 were held at 115 universities and colleges and then complete 3 years of satisfactory business experi ence The college continued to publish an annual report containing information on its activities and trends of life underwriting Officers (1946) chairman of the board Julian S Myrick, vice-chairman, William M Duff president, Dr S S Huebner, dean, Dr David McCahan secretary, John A. Stevenson, and treasurer, Sewell W Hodge Headquarters N L corner of 36th and Walnut streets, Philadelphia 4, Pa

American College of Surgeons.—Founded in 1913 by 500 surgeons of the US and Canada, the American Col lege of Surgeons was dedicated to elevating the standards of surgery and to promoting high professional and ethical ideals. Membership in the association increased from 12,620 in 1939 to about 15,000 in 1946 Its endowment in 1946 totalled \$1,000,000 In 1918, 89 hospitals met the criteria of its hospital standardization rules This figure increased to 3,118 in 1946

During World War II the college held war sessions in a number of U.S. cities, attendance at the 1942 sessions in cluded nearly 40,000 physicians and medical students. Travel restrictions imposed for the duration reduced the number of sessions and attendance in the succeeding years. In 1946 the college resumed its annual clinical congress, which was suspended during the war years.

Publications Surgery, Gynecology and Obstetrics, the official monthly journal, Bulletin of the American College of Surgeons, a quarterly, Manual of Hospital Stand ardization (revised edition 1946), Medical Service in Industry and Workman's Compensation Laws (new edition published in 1946).

Officers for 1946 Dr. Irvin Abell, president and chair man of the board of regents, Dr. Paul B. Magnuson, secre

tary, and Dr. Dallas B. Phemister, treasurer. Headquarters: 40 E. Erie St., Chicago, Ill.

American Dental Association.—Founded in 1859, the American Dental association in 1946 was composed of 58 state and territorial societies and about 440 component or local societies. The association's objectives were set forth as the improvement of dental health services to the public by promoting the art and science of dentistry; the direction and encouragement of dental research; improvement of dental education; the dissemination of knowledge of dentistry; enlightenment of public opinion on prevention of oral diseases and the maintenance of high professional standards.

The association's membership grew from 37,919 in 1937 to 63,786 in 1946, the latter figure representing seveneighths of the total number of practising dentists in the United States.

During the 1937–46 decade, the association devoted much time and attention to dental socio-economic problems. It established the Council on Dental Health, whose principal duties were to develop programs for the provision of more adequate dental care for the public. The association also developed a set of principles deemed essential in the establishment of programs to improve dental health.

In 1938 the A.D.A. established the Council on Dental Education, which, among other things, organized and administered criteria for accreditation of institutions for the study of dentistry in the United States. As a result of the council's activities, all but 3 of the 40 dental schools in the country were approved or provisionally approved.

Through its Council on Dental Therapeutics and its research commission, the association greatly improved the quality and standards of dental medicines and dental materials. It also sponsored two bills in congress: one to provide federal funds for dental research and one to provide grants-in-aid to states for dental education of the public and dental services, particularly for children.

During World War II the association and its members actively engaged in the war effort. Approximately 22,000 dentists served in the army and navy. After the war, the association co-operated with the Veterans' administration in caring for the dental needs of veterans.

Publications: the Journal of the American Dental Association (issued 24 times yearly) and the Journal of Oral Surgery, issued quarterly. Officers (1947) were: Dr. Sterling V. Mead, president; Dr. E. B. Penn, first vice-president; Dr. B. B. McCollum, second vice-president; Dr. M. D. Huff, third vice-president; Dr. Harold Hillenbrand, secretary, and Dr. Roscoe Volland, treasurer. Headquarters: 222 E. Superior St., Chicago 11, Ill.

American Economic Association.—A professional association of economists, the A.E.A. was founded in 1885 to encourage economic research and to stimulate discussion of economic problems. During the 1937—46 decade the organization nearly doubled its membership and subscribers. In 1937 members totalled 2,713 and subscribers 1,219. In 1946 membership was 4,662 and subscribers were 2,161. The 58th annual meeting held at Cleveland, O. (Jan. 24–27, 1946), was the first of national scope since 1941. Publications: American Economic Review (quarterly) and Papers and Proceedings of the annual meetings. Officers (1946): president, E. A. Goldenweiser; vice-presidents, Carter Goodrich and Simon S. Kuznets; secretary-treasurer, James Washington Bell. Headquarters: Northwestern university, Evanston. Ill.

American Federation of Labor.—Founded in 1881 as an association of labour unions, the American Federation of

Labor adopted three objectives—to organize unorganized workers, to promote the interests of its members through legislative activity and publicity and to settle disputes among its members. Final authority was vested in the federation's autumn convention. Between conventions, the federation was to be governed by an executive council made up of the president, vice-presidents and the secretary-treasurer.

Total membership of the A.F. of L. in 1936 was reported to be 3,422,398; but the defection that year of the 10 unions that later formed the Congress of Industrial Organizations sharply reduced the federation's membership, which in 1937 was reported at 2,860,933. However, a vigorous organizing campaign during the 1937–46 decade brought the federation's rolls up to 7,151,808 as of Aug. 31, 1946. Claimed membership at the end of 1946 was put at 7,500,000.

In 1938 the A.F. of L. intensified its organizing activities, particularly among white-collar workers and unorganized employees in many industries. The following year the A.F. of L.-C.I.O. schism widened after the federation's leadership made frequent complaints that the National Labor Relations board was showing favouritism toward the C.I.O. in its rulings. The Roosevelt administration made an attempt that year to patch up the quarrel between the two organizations but achieved no tangible results.

The federation pledged its full and unqualified support of the government in its war program and subscribed to a no-strike policy on all defense projects. All unions were urged to forego strikes during the war emergency, although A.F. of L. officials insisted that workers be free from legislative restrictions on their economic rights. The A.F. of L. was critical of government activities on the home front during the conflict and in 1943 it assailed the Office of Price Administration's failure to check rising living costs and demanded repeal of the Smith-Connally act.

After the close of the war, the A.F. of L. announced a postwar program that included provision for return of prewar rights and privileges voluntarily relinquished during the conflict, such as free collective bargaining, abolition of wartime controls over labour and industry, increased wages, etc. In the legislative field, the federation called for enactment of the Kilgore bill providing for broader unemployment compensation, enactment of the Murray-Wagner Full Employment bill, a postwar housing bill, a law lifting minimum wage levels and the Wagner-Murray-Dingell Social Security bill.

Internationally, the federation gave its full support to the International Labour organization and refused participation in the newly created World Federation of Trade Unions on grounds that the participating soviet trade unions were not "representative" of wage earners.

One of the key labour events of early 1946 was the return of the United Mine Workers, with its 600,000 members, to the A.F. of L., after an absence of 10 years. In that year the A.F. of L. chartered three new unions, the Maritime Trades department, the National Association of Postal Supervisors and the National Farm Labor union. The latter organization sought to organize farm workers on large plantations and commercial farms in the southern states.

Officers of the A.F. of L. elected at its convention in Oct. 1946 in Chicago were: William Green, president; George Meany, secretary-treasurer. Headquarters: the American Federation of Labor building, Washington, D.C.

American Geographical Society.-Founded in 1852 primarily as a research institution to advance geographical knowledge, the American Geographical Society of New York carried on original investigations, issued publications, sponsored exploration and gave awards, honours and medals for outstanding achievement in exploration and geographical research. The society continued to publish the Geographical Review (a quarterly journal) and Curnent Geographical Publications, a monthly list (initiated in 1938) of selected books, pamphlets, articles, maps and photographs, which was added to the society's special research catalog. An outstanding event in the record of the society was the completion in 1945 of the 107-sheet Map of Hispanic America on the scale of 1:1,000,000, on which an average of 7 compilers, draftsmen and editors had been engaged for the preceding 25 years. Work on other long-range undertakings was largely suspended during World War II in order to carry out research and cartographic projects for government agencies.

Membership in the society increased from 3,500 at the end of 1935 to 4,648 at the end of 1946. During the 10-year period, the library collection was increased from 100,400 books and volumes of periodicals, 17,100 pamphlets and 9,100 photographs to 117,756 books and periodicals, 23,523 pamphlets and 26,563 photographs. The map collection of 89,300 maps and 1,710 atlases at the end of 1935 reached a total of 144,194 maps and 2,365 atlases at the end of 1946. Fourteen volumes covering a wide range of geographical subjects were added to the society's monograph series, which totalled 70 vol. at the close of 1946.

Officers of the society (1946): Roland L. Redmond, president; Dr. John K. Wright, director. Headquarters: Broadway at 156th St., New York 32, N.Y.

American Historical Association.—Founded in 1884, the American Historical association was incorporated by an act of congress five years later "for the promotion of historical studies.. and for kindred purposes in the interests of American history." Its members, recruited chiefly from teachers and writers of history in United States and Canadian schools and colleges, numbered about 3,300 in 1937 and 3,812 in 1946.

Activities of the association during the 1937–46 decade were many, and their scope was wide. It published an important series of U.S. legal records, another important series of material relating to the history of the U.S. and a third series of historical monographs covering the whole field of history. The association co-operated with the National Council for the Social Studies in the publication of Social Education, dealing with the problem of teaching history in the schools. During World War II the association was engaged in preparation of discussion pamphlets for use in the armed forces.

Publications: the American Historical Review, a quarterly, and an annual report in three volumes. Officers (1946) were: Prof. Sidney Bradshaw Fay, president, and Dr. Guy Stanton Ford, executive secretary. Headquarters: Study Room 274, Library of Congress annex, Washington 25, D.C.

American Institute for Property and Liability Underwriters.—The institute was created in 1942 under sponsorship of seven national insurance organizations, maintaining, however, its independence in management. Its objectives were defined as the establishment of an educational standard for property and casualty insurance underwriters.

To obtain the award of Chartered Property Casualty Underwriter (C.P.C.U.), candidates were required to pass examinations in insurance principles and practices, general education, general commercial and insurance law and accounting and finance. In 1946, 89 persons held the C.P.C.U. designation.

Officers (1946) were: Dr. S. S. Huebner, chairman of the board of trustees; H. P. Stellwagen, president; Harry J. Loman, dean; Arthur C. Goerlich, secretary, and Otho E. Lane, treasurer. Headquarters: Hamilton Court, 39th and Chestnut streets, Philadelphia 4, Pa.

American Institute of Accountants.—Founded in 1887, the American Institute of Accountants adopted as its objectives the maintenance of high standards of education and practice for the profession and development of the technique of accounting to serve the public interest. Governed by a council consisting of 48 elected members, 4 elected officers and past presidents, the institute continued to prepare the official C.P.A. examinations for 44 states, the District of Columbia and 4 territories. The 40 committees of the institute continued to work toward improvement of the federal income tax system, conduct special studies in accounting and auditing problems and strive to promote better accounting and auditing for government agencies.

Membership of the organization as of Scpt. 30, 1946, was 10,149. Publications: the Journal of Accountancy. national professional monthly magazine, and the Certified Public Accountant, a monthly news bulletin. Officers (1946) were: Edward B. Wilcox, president; Parry Barnes and Percival F. Brundage, vice-presidents; Maurice E. Peloubet, treasurer, and John L. Carey, secretary. Headquarters: 13 E. 41st St., New York, N.Y.

American Institute of Architects.—Founded in 1857 as the national organization of the architectural profession in the United States, the American Institute of Architects included 76 local chapters and 20 state associations in 1946. The institute continued to publish its monthly magazine, Journal of the American Institute of Architects. Officers (1946): president of the board of directors, James R. Edmunds, Jr.; vice-president, Samuel E. Lunden; secretary, Alexander C. Robinson, III; treasurer, Charles F. Cellarius. Headquarters: 1741 New York Ave., N.W., Washington 6, D.C.

American Institute of Chemical Engineers.—This organization was founded in 1908 for the advancement of chemical engineering in theory and practice. During World War II many of its regular activities were curtailed because of wartime restrictions. The institute's official publication: Transactions of the American Institute of Chemical Engineers, a bimonthly. Membership in 1946 was 6,403. Officers (1946): president, James G. Vail; vice-president, Charles M. A. Stine; secretary and executive secretary, Stephen L. Tyler; treasurer, C. R. DeLong. Headquarters: 50 E. 41st St., New York, N.Y.

American Institute of Electrical Engineers.—The institute was established in 1884 as a membership society of individual electrical engineers, devoting its efforts primarily to advancing the theory and practice of electrical engineering and allied fields and maintaining a high professional level among its members. During the 1937–46 decade its membership increased from approximately 15,000 to 27,000. Sections activities were greatly expanded as were the activities of all other divisions of the institute. Publications: Electrical Engineering, a monthly; Transactions and Yearbook, both annuals, and other publications appearing irregularly. Officers (1946): J. Elmer Housley, president; H. H. Henline, secretary. Headquarters: 33

American Institute of Mining and Metallurgical Engineers.—The American Institute of Mining and Metallurgical Engineers was founded in 1871 to promote the arts and sciences connected with the economic and scientific research for production and use of metallic and non-metallic minerals.

Membership of the institute in 1946 was 15,000. Publications: Mining and Metallurgy, a monthly magazine, as well as periodicals dealing with various phases of mining and metallurgical technology. The institute's funds had a principal value of about \$650,000 in 1946.

Officers (1946): Louis S. Cates, president; A. B. Parsons, secretary. Headquarters: 29 W. 39th St., New York 18, N.Y.

American Iron and Steel Institute.—The American Iron and Steel institute's predecessor organization, the American Iron association, was formed in 1855. The institute defined its purposes as the promotion of the interest of the iron and steel industry, the encouragement of the use of iron and steel and the collection of statistics and other information concerning the industry.

Within the institute 43 committees were set up, dealing with technical aspects of operations in the industry alone. Its publications included Steel Facts and Steelways, as well as occasional technical bulletins, books and pamphlets. In the critical years prior to the outbreak of World War II, defense activities were the institute's major preoccupation. After U.S. entry into World War II, the major part of the institute's activities were devoted to furthering the war effort.

Through its committees, it served as liaison between war agencies and steel producers. Officers (1946) were: Walter S. Tower, president; B. F. Fairless and Frank Purnell, vice-presidents; Harold L. Hughes, treasurer; George S. Rose, secretary. Headquarters: 350 Fifth Ave., New York 1, N.Y.

American Judicature Society.—An organization designed to promote the efficient administration of justice, the American Judicature society was founded in 1913 by Herbert Harley. It was reorganized in 1928 with a membership of 600. The organization had a period of slow but steady growth during the 1937–46 decade; its membership in 1937 was 1,272 and by Oct. 1946 it had increased to 6,012.

The A.J.C. made many notable contributions to judicial reforms and reorganization and continued to publish the *Journal*, a bimonthly magazine with a claimed circulation of 48,000 readers. Officers (1946): president, George E. Brand; chairman of the board, Albert J. Harno; secretary-treasurer, Glenn R. Winters. Headquarters: Hutchins Hall, Ann Arbor, Mich.

American Law Institute.—Founded in 1923, the American Law institute defined as its objectives the pursuit of constructive scientific work for improvement of the law. Its chief task was work on *Restatement of the Law*, a work covering a large part of the common or judgemade law of the United States.

During the 10 years beginning Jan. 1, 1936, the first Restatement of the Law, as planned, was completed: Property, vol. I (Introduction and Freehold Interests) and vol. II (Future Interests, parts 1 and 2) (1936); Restitutions (1936); Torts, vol. III (Absolute Liability, Deceit, Libel, Wrongful Litigation, Domestic Relations, Business, part 1) (1938); Torts, vol. IV (Miscellaneous Torts, Defenses and Remedies) (1939); Property, vol. III (Future Interests, parts 3 and 4) (1940); Security (1941); Judgments (1942); Property, vol. IV (Perpetuities and Other Social Restrictions) (1944) and vol. V (Servitudes) (1944).

Besides the Restatement, the most notable task completed in the 1937-46 decade was the institute's Model Code of Evidence published in 1942. Toward the close of the decade, the institute and the National Conference of Commissioners on Uniform State Laws were co-operating on development of the code of commercial law.

Aside from the official members there were 860 life members in 1945. Officers (1946): George Wharton Pepper, president; Learned Hand, vice-president; William Dean Embree, treasurer, and William Draper Lewis, director. Headquarters: 3400 Chestnut St., Philadelphia 4, Pa.

American Legion.—The American Legion was chartered by congress in 1919 as an organization of U.S. veterans of World War I. On Oct. 29, 1942, Pres. Roosevelt signed an act making honourably discharged veterans of World War II eligible for membership. Since its inception, the Legion's basic program had been to strengthen national defense and to safeguard the rights of veterans.

Legion membership in 1937 stood at 973,841 in 11,393 posts. The influx of returning veterans of World War II increased membership in Dec. 1946 to more than 3,322,000 in nearly 16,000 posts. Legion statistics then disclosed that more than 68% of the membership was composed of World War II veterans.

At the beginning of the 1937–46 decade, the Legion endorsed policies stressing world peace and neutrality and urged further strengthening of U.S. national defenses. In 1941 the Legion embraced an all-out war program and registered the larger part of its membership for national defense service. It also sent a mission to Britain to study civilian defense and participated in the training of many citizens in the U.S. in civil defense duties.

Between 1937 and 1941, the Legion also conducted campaigns for government protection of World War I widows and orphans and veterans' preference in civil service employment, and urged an intensive Americanism campaign. It also advocated further restrictions on immigration and opposed communism.

During the first phase of U.S. participation in World War II, the Legion was active in selling war bonds, manning aircraft warning systems, aiding the nationwide scrap metal and rubber collections and conducting a variegated number of similar services of assistance to the war effort.

On the national political front, the Legion campaigned for expediting claims of World War II veterans, for government compensation and enactment of the G.I. Bill of Rights and the measure providing financial assistance for needy dependents of deceased veterans of World War II. It also distributed Christmas gifts to wounded and sick servicemen in domestic hospitals.

In 1945 the Legion recommended a program for national security buttressed on universal training; the program included scientific research, a world-wide military intelligence system and a strong navy and urged retention of atomic bomb secrets and merger of the armed services.

Credit for five major legislative actions of benefit to war veterans in 1945-46 was claimed by the Legion. These were: (1) the bill providing for terminal leave pay for enlisted men and women: (2) amendments liberalizing the G.I. Bill of Rights; (3) a 20% cost-of-living increase in compensation and pension rates for disabled veterans; (4) amendments liberalizing the surplus property act and (5) amendments liberalizing the National Service Life Insurance act.

The Legion's national publications: the American Legion Magazine, a monthly, and the National Legion-

American Library Association.—Founded in 1876, the ALA became the official organization of librarians in the United States and Canada Consisting of librarians, library trustees and others interested in libraries, the ALA in 1946 was the oldest association of its kind, affiliated with more than 60 other library associations in the United States and other countries.

During the decade, the ALA. continued to promote one of its principal objectives complete and adequate library coverage for the United States and Canada, particularly in the rural areas which were without access to a public library. Its activities and services continued to be carried by a large headquarters staff, about 80 committees and boards of volunteer workers. Its program included informational and advisory services, personnel service, field work and monprofit publication of numerous professional books and pamphlets. Among its publications are the following periodicals. ALA Bulletin, Booklist, College and Research Libraries, Hospital Book Guide and Subscription Books Bulletin.

The ALA's activities during the 1937–46 period were broad and varied. In 1938 the ALA worked for inclusion of grants for rural library service as well as other projects in the public interest. During the decade, the ALA handled funds, chiefly from the Rockefeller foundation and the department of state, totalling more than \$1,500,000 in making gifts of books to libraries in war countries and in arranging exchange of personnel between foreign and US libraries

After US entry into World War II, the ALA. encouraged the US public libiaries to act as war information centres, sources of research material and as disseminators of authentic ideas and facts about war and postwar prob lems to civilians. The association also engaged in inter national activities which were coordinated under the Board on International Relations Acting on ALA rec ommendations, the Office of War Information and the Co ordinator of Inter American Affairs established US infor mation libraries in the major cities throughout the world these were later taken over by the department of state ALA also co sponsored with the American Red Cross and United Service organizations the Victory Book cam paign In 1944 it published its "Bill of Rights," which rec ommended that books believed to be factually correct should not be banned or censored because of disapproval by some persons

After the close of World War II, the ALA. opened a Library National Relations office in Washington, D.C.

Membership in the ALA increased from 14 000 in 1936 to more than 16,000 in 1946 Executive secretary Carl H Milam Executive offices 50 E Huron St, Chicago, Ill

American Medical Association.—Founded in 1847, the American Medical association established its aim as the

promotion of the art and science of medicine and the betterment of public health Strictly a nonprofit organization, it devoted all of its income toward realization of these objectives. The association's capital in 1946, valued at about \$7,100,000, consisted of securities in the amount of \$5,600,000 and assets and property totalling \$1,500,000. Its net income in 1945 was more than \$1,000,000.

The administrative structure of the association became pyramidal in form. At the base were the numerous county medical societies, these bodies elected members to the state associations, each governed by a house of delegates. At the apex was the national house of delegates, with members elected by the state bodies. Authority to establish policies was vested in the national house of delegates, convening in official session once annually, although it could be convoked for special emergency sessions. The affairs of the association continued to be run by a board of nine trustees representing various sections of the United States—two elected each year to serve five year terms.

The great majority of the physicians in the United States belonged to the American Medical association at the end of 1946. At the beginning of the 1937–46 decade, 105,400 physicians were listed as members of the AMA, this figure increased to 128,000 by the end of the decade

The association's list of publications continued to be headed by the Journal of the American Medical Association, a weekly journal with a circulation of more than 130 000. Other publications Hygeia, a monthly, nine medical journals for various medical specialties, a directory of the medical profession, schools, libraries and hospitals, the Quarterly Cumulative Index Medicus, The Standard Nomenclature of Diseases and Operations

During the 1937–46 decade, the association was especially active in prompt testing of some medicinal products which proved subsequently to be merely nostrums In 1937 its laboratory was able to prove that the solvent in the so called "elixir of sulfanilamide" was the toxic agent that caused the deaths of 73 persons.

Activities of the council on industry (which set standards and promoted improvement in care of industrial workers) and the council on medical service (which encouraged the growth of voluntary sickness insurance plans) gained importance during the decade because of the AMA's consistent opposition to administration plans for instituting a government sponsored health insurance program. The association's objections stemmed from its concern lest "socialized medicine" result in lowered fees for physicians and the introduction of "politics" in the profession.

In World War II the American Medical association was actively engaged in helping the government war effort, and many of its operations were handled through its committee on war participation. A suboffice of the War Manpower commission, set up in its headquarters, engaged in procuring and assigning physicians for the armed forces and for civilian areas in need of medical personnel.

Officers (1946) were Harrison H Shoulders, president, Olin West, president elect, George F. Lull, secretary and general manager, J J Moore, treasurer, Morris Fishbein, editor of publications, and Thomas R Gardiner, business manager Headquarters 535 N Dearborn St., Chicago.

American Society of Civil Engineers.—Founded in 1852, the American Society of Civil Engineers adopted as its objectives the advancement of the sciences of engineering and architecture, and the fostering of professional improvement of its members General funds of the society totalled about \$850,000 in 1946, its interest in the Engineering and Societies building accounted for another

The society continued to conduct its activities through its professional committees on employment conditions, engineering education, registration of engineers, salaries, professional conduct, etc. Its technical divisions covered the practice of engineering in 13 categories, and its work in various communities of the country was carried on under its 65 local sections. Its student chapters worked in 123 engineering colleges.

Membership in Aug. 1946 was about 21,500. Publications: Proceedings, a monthly technical journal; Transactions, an annual, and Givil Engineering, an illustrated magazine. Officers: Wesley W. Horner, president; Col. William Carey, executive secretary; Charles E. Trout, treasurer. Headquarters: 33 W. 39th St., New York 18, N.Y.

American Society of Mechanical Engineers.-Organized in 1880, the American Society of Mechanical Engineers set forth as its objectives the fostering of mechanical engineering and related arts and sciences, the advancement of engineering standards and the broadening of usefulness of the engineering profession. The society grew from a membership of 189 at the time of its first annual meeting in 1880 to more than 19,000 members in 1946, grouped into 18 divisions and 70 local sections, including one in Canada. Student branches were also maintained in 120 schools. The society continued to award its A.S.M.E. medal, the Holley medal, the Worcester Reed Warner medal, the Melville medal, the Spirit of St. Louis medal and others. Publications: 'Mechanical Engineering, a monthly journal, and Journal of Applied Mechanics, a quarterly. Other books and material relevant to mechanical engineering continued to be published on occasion. Officers (1947); president, Eugene W. O'Brien; treasurer, K. W. Jappe, and secretary, C. E. Davies. Headquarters: 29 W. 39th St., New York 18, N.Y.

American Veterans Committee.—An organization of veterans of World War II, A.V.C. was founded on Jan. 31, 1943, and assumed its name in Oct. 1944. A.V.C.'s goal was defined as the achievement of "a more prosperous and democratic America and a more stable world." In late 1946 A.V.C. had between 80,000 and 85,000 members. It was active in support of terminal leave pay, the G.I. Bill of Rights, housing for veterans and continuation of price control. A.V.C. denounced the sentence accorded to Col. James A. Kilian at the Lichfield trials in 1946 and demanded investigation of the army's court-martial system. Official publication: the A.V.C. Bulletin, a semimonthly newspaper. Officers (1946): Charles G. Bolté, chairman; Gilbert A. Harrison, vice-chairman. Headquarters: 1860 Broadway, New York 23, N.Y.

American Veterans of World War II (Amvets).— Founded at Kansas City, Mo., on Dec. 10, 1944, Amvets is a veterans' organization composed exclusively of former soldiers, sailors and marines of World War II.

Eligible for Amvet membership are any honourably discharged persons who served in the U.S. armed forces, or U.S. citizens who fought in the armed forces of any U.S. ally, between Sept. 16, 1940, and the date of the close of hostilities. Membership lists are also open to any soldiers, sailors or marines on active duty who meet other specified qualifications.

By the close of 1946 there were more than 1,050 Amvet posts in all the 48 states and in Hawaii. Membership was put at about 100,000.

At its second national convention, held in St. Louis, Mo., Nov. 21–24, 1946. Amvets adopted a broad national program that stressed special privileges for veterans in the domestic field.

Ray Sawyer was elected national commander of Amvets at the Nov. 1946 convention. National headquarters are at 724 Ninth St. N.W., Washington, D.C.

Anti-Saloon League of America.—Founded in 1895, the Anti-Saloon League of America stated its objective as "extermination of the traffic in alcoholic beverages and the prevention of alcoholism and attendant evils." The league was active in securing local option, state prohibition and ratification of the 18th amendment. After the latter law was repealed by the 21st amendment in 1933, the Anti-Saloon league shifted the emphasis of its activities toward creation of greater temperance sentiment in the states and local communities.

Official organ of the league: the American Issue. A nonmembership organization, the Anti-Saloon league continued to be supported by voluntary contributions. Officers elected at the 1946 convention were Bishop Ralph S. Cushman, president; Bishop G. D. Batdorf, vice-president; Samuel Reid, treasurer, and Frederick W. Smith, recording secretary. National headquarters: 131 B St. S.E., Washington 3, D.C.

Authors' League of America.—A national organization of U.S. authors, dramatists, radio writers and screen writers, the Authors' League of America was founded in 1912 to procure adequate national and international copyright laws. In 1920 the organization was divided into guilds, such as the Authors' guild, Dramatists' guild and Screen Writers' guild. Most of the established writers in the United States are members of the organization.

The executive secretary of the organization is Louise M. Silcox. Headquarters are at 6 E. 39th St., New York 16, N.Y.

Boys' Clubs of America.—A federation of local groups, nonsectarian, Boys' Clubs of America was founded in May 1906, in Boston, Mass., to provide leisure-time activities under trained leadership for boys of 7 to 18, chiefly in congested urban districts. As of 1946, the organization represented 260 Boys' clubs with more than 250,000 members. Among the many services provided by the national organization were a field service to inform, advise and assist Boys' clubs, as well as services for personnel and training, building, supply and publicity. Publications: the Boys' Club Bulletin, the Boys' Club Courier and the Boys' Club Service. Officers (1946): chairman of the board, Herbert Hoover; president, William Edwin Hall; treasurer, Albert H. Wiggin; secretary, William Ziegler, Jr.; executive director, David W. Armstrong. Headquarters: 381 Fourth Ave., New York 16, N.Y.

Boy Scouts.—The Boy Scout movement was founded in the British Isles in 1908 and later spread to every civilized country in the world. The movement was free to boys of all races, creed or colour, and the organization's leaders continued to emphasize its nonmilitary, nonpolitical, nonclass and nonsectarian nature.

Boy Scouts of America.—Between 1937 and 1941, Boy Scouts of America (the U.S. section of the movement) engaged in its usual peacetime activities. In 1940 the scouts adopted an extensive program to be of assistance in the national emergency and after the U.S. entry into World War II placed their entire resources at the service of the government. During the conflict scouts rendered outstanding service in the salvage campaigns, in encouraging sales of war bonds, in victory gardening, etc.

At the request of the government, scouts in 1946 helped put over many postwar projects, including collection of clothing and materials to be sent abroad and cultivation

of victory gardens to alleviate critical food shortages

The total number of boys in the organization in 1946 was 1499 184 while scout leaders numbered 493 186 The number of scout units was 64 080 Officers (1946) were Amory Houghton president Elbert K Fietwell chief scout executive Headquarters 2 Park Ave, New York 16 NY

Great Britain —During the battle of Britain scouts served as wardens foot cycle and motorcycle messengers and telephone operators. They formed decontamination squads helped police air raid shelters trenches and sand bag emplacements gave first aid assistance to people injured during the bombin, s and formed stretcher units to speed the seriously injured to hospitals. The number of emergency war jobs performed by the scouts totalled nearly 200 and scores of individual scouts and scout units were decorated by a grateful government for their yeoman service.

Lord Baden Powell founder of the Boy Scout movement died in early 1941 and Lord Rowallen was elected chief scout of the British Boy Scout association in 1945 John Skinner Wilson was appointed director of the International Scout bureau located in London

Brookings Institution—A nonprofit corporation the Brookings institution was founded in 1916 for scientific and educational work in the US public interest. Its principal efforts were made in research and training in the fields of economics and government. The institution's grants of research fellowships to a limited number of advanced graduate students were temporarily discontinued during World Wat II

During the decade 1937-46 the Brookings institution published 46 books and 11 pamphlets in the field of eco nomics and government. Among some of its publications were The Recove & Problem in the United States (1937) The Income Structure of the United States by Maurice Leven (1938) Reon-anization of the National Government by Lewis Meriam and Ι Γ Schmeckebier (1939) Labor Relations in the Iutomobile Industry by William H Mc Pherson (1940) The Presidents and Civil Disorder by Bennett Milton Rich (1941) Peace Plans and American Choices, by Arthur C Millspaugh (1942) World Miner als and World Peace by C K Leith J W Furness and Cleona Lewis (1913) The Control of Germany and Japan by Harold G Moulton and Louis Marlio (1944) Inter national Tribunals Past and Tuture by Manley O Hud son (1945) and Relief and Social Security by Lewis Meriam (1946)

Officers Harold G Moulton president Lewis Meijam vice president and Elizabeth H Wilson secretary Head quarters 722 Jackson place NW Washington 6 DC

Camp Fire Girls—Camp Fire Girls Inc. an organization in the United States serving girls between the ages of 7 and 18 was founded in 1910 and incorporated 2 years later with the objective of supplementing the training of girls in home school and church by directing their recreational activities into the proper channels. Membership in the organization increased from 234 664 in 1936 to more than 360 000 (in more than 1300 communities) in 1946.

Camp Fire Girl units were divided into 3 age groups (1) the Bluebirds ranging from 7 through 9 years of age (2) Camp Fire Girls from 10 through 14 and (3) Horizon Clubbers ranging from 15 through 18

During World War II the Camp Fire Girls carried out a 'Service for Victory' program which included such activities as selling war bonds salvaging needed materials aid

ing the Red Cross, child tending victory gardening and helping to offset delinquency by organizing parties, out ings and games for younger children

Official magazine the Camp Fire Girl, a monthly Officers in 1946 Martha F Allen, national director Mrs James C Parker president, Dr Bernice Baxter, vice president Larle W Brailey, chairman of the board, Glenn O Hoff hines, treasurer, Mrs Frank C Love, secretary Head quarters 88 Lexington Ave New York 16 N Y

Carnegie Trusts—The Cainegie Trusts in 1946 comprised the second largest group of charitable foundations in the world. A brief resume of the activities of the principal U.S. trusts during the 1937–46 decade follows

Carnegie Corporation of New York—Largest of all the foundations this corporation was founded in 1911 by Andiew Carnegie for the express purpose of "the advance ment and diffusion of knowledge and understanding among the peoples of the United States" Its scope was extended in 1917 to include the British dominions and colonics

The corporation had a basic endowment of more than \$135,000,000 Book value of the total assets of the main endowment fund as of Sept 30, 1946, was \$152,937,620 Book value of the assets of the British Dominions and Colonies fund as of the same date was \$14,305,061

The program of this foundation included advancement of education through complete or partial support of specific undertakings in institutions of higher learning in organizations and agencies devoted to general education in national and international affairs. It also included projects giving promise of new knowledge

Between 1937 and 1946 the Carnegie Corporation of New York appropriated about \$38 000 000 for achieve ment of the above mentioned goals. The total amount appropriated since the corporation's inception in 1911 was about \$200 000 000

President of Curregie Corporation of New York (1946) Develope C Josephs Secretary Robert M Lester, and tensurer and investment officer C Herbert Lee

Cuncilled also founded and endowed separately five other ischies in the United States as follows

Carnegie Institute of Pittsburgh —Founded in 1896 the Carnegie Institute of Pittsburgh in 1946 consisted of a museum of fine arts a music hall a museum of natural history a public library and an associated institute of technology with a library school It had a capital of \$36 000 000 in 1946

Carnegie Institution of Washington —Founded in 1902 to encourage scientific research this institution had spent about \$50,000,000 by the end of 1946 in investigation, research and discovery and application of knowledge for improvement of the lot of mankind. The institution with a capital of \$35,000,000 consisted of a combination of research departments which conducted important research and work in astronomy terrestrial magnetism, geophysics animal and plant biology and in historical research. During World War II most of its staff and research facilities were largely devoted to the war effort. After the war the regular staff members returned to their posts and the institution's normal functions in basic research were resumed.

Carnegie Hero Fund Commission—Founded in 1904 to give merited recognition to heroic acts performed in the United States Canada and Newfoundland and the waters of these areas by persons who normally would not perform such acts in their regular vocations the commission made 477 awards of medals or funds totalling more than \$1,837-000 during 1937–46 From its inception, the total awards

made by the commission were 3 442 and pecuniary awards totalled \$6,837,051

Carnegie I oundation for Advancement of Teachins — This foundation was established in 1905 to provide free pensions for college professors and to advance higher education Through its Division of Educational Inquiry (and dowed by Carnegie corporation) the foundation substituted many sweeping inquiries in the field of education The foundation also was concerned with such activities as a teacher testing program, graduate examination study and a comparative examination study During the 1937–46 decade it paid more than \$17,000,000 in allowances to retired college professors or their widows making a total of \$50,077,418 paid for such purposes since its establish ment

Carnegie Endowment for International Peace—This organization, founded in 1910 for promoting 'the speedy abolition of international war between the so called civil ized nations' was divided into three sections (1) Intercourse and Education, (2) Economics and History and (3) International Law The endowment with a capital of \$10,000,000, was free to work in any way to encourage peace and good will between nations The Economics and History section was responsible for a 152 vol work on the economic and social history of World War I prepared under the direction of Dr James T Shotwell and divisional editors in 16 countries, through funds made available by the endowment This monumental task was completed in 1937 A 44 vol study of the history of Canadian US relations was completed in 1941

During and after World War II the endowment continued its efforts to further international understanding through research, publication conferences student centres in colleges and universities, distribution of books and p imphlets to strategic centres, study of international law and studies of causes of misunderstanding and means of promoting the general cause of peace

Catholic Community Service, National.-Founded in Nov 1940, the National Catholic Community service was the agency designated by the Roman Catholic Church in the United States to serve men and women in the aimed forces and war workers in overburdened industrial communities A member of the United Service organizations, it was financed by public donations. The NCCS was organized to serve men and women of every creed, but differed from other war agencies in that it held special services for Catholics During World War II, N C C S paiticipated in several hundred operations and also sponsored independent operations in the US and in areas abroad where US armed forces were stationed Its publications included NCCS, a monthly, as well as numerous books and pamphlets Officers (1946) were James S Mitchell execu tive director, and Anne Sarachon Hooley, assistant executive director NCCS headquarters 1312 Massachu setts Ave NW, Washington, DC

Catholic Library Association.—The Catholic Library association was founded in 1921 as the library division of the National Catholic Education association, in 1931 the library association became independent of the parent organization.

Activities were defined to include dissemination of data on library service to member organizations, compilation of bibliographical research to promote Catholic scholarship and encouragement of formations of new units to the association. The association also was organized to function as the standardizing agent of Catholic library schools and to collaborate with other organizations

Publications Catholic Library World, the official organ,

Catholic Periodical Index, Catholic Booklist, a weekly, and the Catholic Supplement to Standard Catalog for High School Libraries Officers (1946) Richard James Hurley president Brother I homas, I S C, vice president, Laurence A Leavey executive secretary Headquarters the Cardinal Hayes library Manhattan college New York, N Y

Commonwealth Fund—The Commonwealth fund was established by Mis Stephen V Harkness in 1918 "to do something for the well ne of mankind. Increased by gifts from the founder and from Edward S Harkness former president of the fund (1918—40) the fund's endowment by 1946 totalled \$50.2,7489. A large portion of its annual appropriations was devoted to the promotion or maintenance of physical and mental health and medical research. In addition fellowships were provided for British gradulate students at U.S universities and aid was given to public health accurates aimed at raising standards of rural hospitals and medical centres.

I rily in the 1937–46 decade the fund aided child guid ince enterprises in England maintained an advisory service for community mental hygiene clinics in the US and made grants for the study of administrative law and legal history

After the start of World Wai II the fund set aside more than \$1,250,000 for war relief and related services, including the rchabilitation of men rejected under Selective Service of discharged from the aimed forces for psychiatric distibilities. The fund continued to publish annually a number of books and pumphlets of educational significance in its fields of operation.

Officers (1946) Malcolm P Aldrich president, Barry C Smith general director Headquarters 41 E 57th St, New York 22 NY

Congress of Industrial Organizations.—An organization of labour unions in the US and Canada the CIO. was founded on Nov 9 1935, as the Committee for Industrial Organization At its first constitutional convention in Pittsburgh Pa, Nov. 14–18, 1936 the committee changed its name, adopted a constitution and named John L Lewis (chief of the United Mine Workers of America) as president Vice presidents were Philip Murray and Sidney Hill man, and James B Carev was elected secretary Additional vice presidents were named at sub equent conventions

The new labour organization was formed by represent atives of eight international unions who broke off their affiliations with the American Federation of Labor in 1935 after the latter organization voted down demands of the eight groups for industrial unionization. The seceding unions then had a membership of about 912 000. In 1946 its membership was reported to be between 6 000 000 and 6 500 000 and the organization comprised about 40 international unions affiliated with it. The CIO had state councils in 36 states and almost 300 city councils throughout the nation.

The CIO's first objective was to organize the employees in the mass production industries such as steel automobiles and textiles into industrial unions. Its early member ship drives were spectacular and were marked by tremen dous gains. Its first major success occurred in 1936 when it compelled the Goodyear firm in Akron, O, to agree to union recognition. It lost subsequent strikes against four of the "Little Steel" companies, but made new gains the following year (1937) in signing up U.S. Steel and General Motors. In 1940 the CIO extended its efforts to organization of craft as well as industrial unions.

John L Lewis, who had given vigorous backing to Pres-

ident Roosevelt in the early phase of the New Deal fell out with the president in 1940 and switched his support to Wendell Willkie, the Republican nominee Lewis an nounced that he would resign if Roosevelt were re elected and made good his promise, the UMW later seceded from the CIO Philip Murray was elected as president after Lewis' resignation

In 1941 the CIOs most noteworthy gains were the organization of employees of the Ford Motor company, the Little Steel companies and other large corporations which previously had refused to sign CIO contracts. It also made rapid strides in organizing US defense industries During World War II the CIOs most noteworthy record was the activity of its then 5000000 members in the war effort and the success of its leaders in keeping strikes at a minimum. In 1943 CIO established the Political Action Committee (q,v) which helped get out the vote for prolabour candidates and for President Roosevelt during the 1944 elections

After the war the CIO backed the Full Employment bill and other pending federal legislation designed to improve living standards among workers. Two major strikes marked the CIO's postwar program for higher wages to combat increasing living costs. The United Automobile Workers staged a walkout at General Motors plants for a 30% wage increase but settled the dispute in March 1946 for a smaller increase and other benefits after a 113 day strike. The month long strike called by the United Steel workers in the "Big' and 'Little' steel corporations was settled in Feb. 1946 on conditions deemed favourable to the CIO.

In 1946 the CIO spurred its organizing drive in the south, opposed abolition of price controls and actively campaigned against what it termed the efforts of anti labour elements to emasculate the Wagner act and other labour measures

Principal CIO publications CIO News, a weekly and Economic Outlook, monthly Officers (1946–47) Philip Murray, president (re elected at 1946 convention in Atlan tic City, NJ), James B Carey, secretary treasurer Head quarters 718 Jackson place NW, Washington 6, DC

Daughters of the American Revolution—Founded in 1890 to perpetuate the memory and spirit of the men and women who achieved US independence, the society devoted itself over the years to the acquisition and protection of historical spots and erection of monuments and to the preservation of relics, documents and records of the revolutionary era

During the 1937–46 decade membership increased from 140,000 to 153,000, and about 100 new chapters were added during that period. The society continued to publish foreign language manuals for citizenship for distribution to aliens through government agencies, it also maintained and operated two schools at Grant, Ala, and Tamassee, S.C., and contributed to 18 other approved schools. The DAR was active in civil defense, relief and charitable activities during. World War II. Principal publications. Daughters of the American Revolution Magazine and National Defense News. Officers (1946). Mrs. Julius Y. Tal madge, president general, Mrs. Stanley Thorpe Manlove, recording secretary general, and Mrs. Charles Carroll Haig, treasurer general. National headquarters. 1720 D. St. N.W., Washington 6, D.C.

DeMolay, The Order of.—Founded in 1919, the Order of DeMolay became a fraternal organization for youth between the ages of 14 and 21 DeMolay's purpose was to

further the seven cardinal virtues of the Masonic order love of parents, reverence, courtesy, comradeship, fidelity, cleanliness and patriotism Admission to the order had two requirements a belief in God and a good character record No Masonic relationship was required or implied

During World War II the order lost virtually all physically fit boys of 17 and over to the armed forces and several hundred chapters necessarily suspended their activities for the duration. In early 1945 many of the dormant chapters asked for reinstatement

Officers (1946) included Frank S Land, founder of the order, who is secretary general and chief administration officer, Stratton D Brooks director, and Chailes A Boycc comptroller Headquarters 201 L Armour Blvd, Kansas City 2, Mo

Elks, Benevolent and Protective Order of.—A fracernal order, the BPOE was organized in New York city in 1868 for the purposes of practising 'charity, justice, broth crly love and fidelity to promote the welfare and enhance the happiness of its members to quicken the spirit of American patriotism to cultivate good fellowship." Membership in the Elks was limited to white male citizens 21 years of age and over In 1946 there were lodges in 1,450 towns and cities in the US and territorial possessions Membership during 1937–46 doubled, increasing from 450 000 to 850 000 During that period expenditures for charitable and welfare purposes amounted to more than \$2500 000 annually During World War II the order's work was directed by the Elks National War commission, which urged local lodges to give full support to the war effort

Official organ of the order the *Elks Magazine* Officers of the Grand Lodge, BPOE Charles E Broughton grand evalted ruler, J E Masters grand secretary, and John F Burke, grand treasurer Headquarters Elks Na tional Memorial Headquarters Bldg, 2750 Lake View Ave Chicago 14 Ill

Falk Foundation, The Maurice and Laura.-The Talk foundation was established Dec 14, 1929, by a capital fund gift from Maurice Falk, who specified that the fund was to be used within a period of 35 years for the "betterment of mankind" Specific uses to be made of the money were left to the foundation's board of managers Mainly the Falk fund concentrated on supporting economic research (by grants to outside organizations) From 1937 to 1946 inclusive, the foundation made research grants to such organizations as the Brookings institution, Washington, DC, the National Bureau of Economic Research, New York, the American Law institute, the National Conference of Commissioners on Uniform State Laws, Philadelphia and Chicago, the Committee on Postwar Tax Policy, New York, and the Committee on Public Debt Policy, New York Many publications were issued under the foundation's grants Throughout World War II, the foundation's principal interest was in studies designed to promote orderly economic postwar demobilization. Following the war, the foundation resumed its interests in encouraging peacetime economic stability and progress

Grants during the 1937-46 decade totalled more than \$2,500,000 Capital assets of the foundation on Dec 31, 1946, were \$6,967,025 87 Officers of the board of managers Leon Falk, Jr, chairman, J Steele Gow, executive director Headquarters Farmers Bank building, Pittsburgh, Pa

Four-H Clubs.—Four H clubs, organizations of rural boys and girls with activities guided by local and volunteer leaders, continued to operate under the direction of county extension agents co operatively employed by the US de-

partment of agriculture, state colleges of agriculture and county extension organizations. The name Four H derived from the four phases of training emphasized in the work of the members—' head heart hands and health.'

Generally the clubs were organized on the community basis, although in some states they were restricted to spe cific agricultural interests as dairying canning etc. Mem bers usually were between the ages of 10 and 20 Each club elected its own officers and mapped out its own program for the year. No national organization of Four H clubs was established

The skills and experience acquired by the Four H mem bers enabled them to make considerable contributions to the nation's war effort, and it was estimated that during World War II Four H members produced and conserved enough food to feed 3 000 000 soldiers for an entire year In addition to their work in gardening raising crops and livestock and in conserving surplus, they also assisted in collection of scrap and in the sale of war bonds

Membership in Four H clubs in 1938 totalled more than 1,192 000 boys and girls, and the number of local volunteer leaders in that year was more than 125 000 By 1945 enrol ments of youth in the clubs was about 1 700 000 while the local volunteer leaders totalled 175 000

Girl Guides —The object of the World Association of Girl Guides formed in 1928 was stated as the promotion of unity of purpose and common understanding in the fundamental principles of Guiding and Girl Scouting throughout the world and to encourage friendship be tween the girls of all nations. In 1936 there were 27 full members and 4 tenderfoot members (countries where the organization was not yet fully developed). In 1946 the membeiship was as follows full members—Australia Belgium, Brazil, Canada Czechoslovakia, Denmark Egypt, Finland, France, Great Britain Hungary India Ireland Luxembourg, the Netherlands, New Zealand Norway Poland South Africa Sweden Switzerland and the United States of America tenderfoot members—Costa Rica Greece Guatemala, Haiti Italy and the Philippines

The first postwar biennial conference—the 11th—was held in France in Sept 1946

Girl Scouts — The Girl Scouts were formed in 1912 for the purpose of promoting good citizenship. During the 1937-46 decade membership in the organization increased from 435 142 to 1213 913 Each year the Girl Scouts pro gram has emphasized different projects for practical appli cation of its better citizenship objective During World War II the Girl Scouts launched the Senior Service Scouts to aid in the US civilian defense program a campaign for promoting the sale of war bonds and stamps and the Wing Scouts a preflight aviation program for Senior Girls Senior Scouts volunteered as farm aides, engaged in home gardening and canning helped at blood donor centres and inaugurated an international friendship program to pro vide milk, clothing and school equipment to children of war torn countries A "share the food plan" was originated whereby profits from "starvation' luncheons were turned over to relief organizations

The Girl Scouts of the United States and members of similar groups in 32 other countries became members of the World Association of Girl Guides and Girl Scouts which before the war had a membership of more than 5,000,000

A number of books were published by the Girl Scouts, including Girl Scout Handbook (Intermediate) Periodicals included the American Girl (monthly) and the Girl Scout Leader (10 times annually) a variety of pamphlets and an Annual Report

Officers (1946) Mrs Harry S Truman honorary president Mrs C Vaughn Ferguson, national president Mrs Paul T Kammerer, Jr chairman national executive committee, and Mrs Paul Rittenhouse national director Headquarters 155 E 44th St New York 17 NY

Grand Army of the Republic –On April 6 1866 a handful of Civil War veterans meeting at Decatur, Ill, founded the first post of the Grand Army of the Republic, an organization of Union soldiers sailors and marines. The idea grew in popularity among Union veterans and by 1890 the Grand Army of the Republic had a peak membership of 409 489. Thereafter old age took an in creasing toll of the veterans and by 1937 the GAR enrol ment had shrunk to 2443. At the close of the 1937–46 decade the surviving members totalled about 75 many of whom were centenarians. The rules and regulations provided that the organization could carry on until the death of the last surviving member.

Affiliates of the GAR included the Woman's Relief corps Ladies of the GAR Daughters of Union Veterans of the Civil War Sons of Union Veterans of the Civil War and the Auxiliary to the Sons of Union Veterans of the Civil War

Officers for the 1946–47 period were commander in chief, John H Grate senior vice commander in chief Theodore A Penland junior vice commander in chief Orlando Le Valley chaplain in chief Robert M Rownd and secretary, Co1a E Gillis Correspondence with the or ganization could be addressed to GAR in care of Daugh ters of Union Veterans of the Civil War 1326 18th St NW Washington DC

Guggenheim Memorial Foundation—The John Simon Guggenheim Memorial foundation was created in 1925 with the basic objectives of improving the quality of education and the practice of arts and professions in the United States of fostering research and of promoting better understanding between nations. In order to achieve these aims the foundation offered a limited number of fellowships to scholars and artists for research in any field of knowledge and for creative work in any field of fine arts including music

During World War II the foundation's trustees exclusively earmarked an additional \$400,000 for postservice fellowships. The funds were put aside for use by young scholars artists and writers serving in the nation's armed forces and other government services to be made available to them upon their discharge from service. In all 157 postservice fellowships were awarded.

Funds of the foundation as of Jan 1 1946 totalled \$20 268 324 22 Officers (1946) Mrs Simon Guggenheim president Francis H Brownell vice president Otto L Myers treasurer and Henry Allen Moe secretary Head quarters 551 Fifth Ave New York NY

Hayden Foundation, Charles—The Hayden foundation was incorporated in New York in 1937 and had funds totalling more than \$50,000,000 in 1946. Its purposes and objectives as specified in Hayden's will were to improve the training and education of the youth of the United States in order to rear a nobler race of men who will make better and more enlightened citizens to the ultimate benefit of mankind. To carry out these objectives pief erence was given to youth living in Boston Mass and New York, NY, although the foundation's charter in cluded provisions for extension of benefits to other localities. J. Willard Hayden became the organization's first president.

Institute of Pacific Relations.—An international research and educational organization, the Institute of Pacific Relations was founded in 1925 for the study of the peoples of the Pacific area and their mutual relations.

Member councils included: the American council, the U.S.S.R. council, Australian Institute of International Affairs, Canadian Institute of International Affairs, China Institute of Pacific Relations, Comité d'Etudes des Problèmes du Pacifique (France), Netherlands-Netherlands Indies council, New Zealand Institute of International Alfairs, Philippine Institute of Pacific Relations and Royal Institute of International Affairs (Great Britain). Publications included the Far Eastern Survey, a semimonthly journal, and Pacific Affairs, a quarterly magazine. In addition the institute by 1946 had published more than 700 books and pamphlets prepared by scholars from various countries. Chairman (1946) of the Pacific council: Percy E. Corbett. Chairman of the American council (1946): Robert G. Sproul. Headquarters of the American council: 1 E. 54th St., New York 22, N.Y.

Kiwanis International.—An organization founded at Detroit, Mich., in 1915, the Kiwanis International was devoted principally to development of closer relationships between business, industrial, professional and agricultural leaders and to fostering of civic, social and welfare service in its respective communities. Membership was limited to two men from each of the above categories in any one community. Each local club was given autonomy, but a district and international organization was established to further co-operation for achievement of Kiwanis objectives.

After U.S. entry in World War II, Kiwanis gave full support to all activities which contributed to the conduct of the war and war-work was added to its program. Membership of Kiwanis in 1937 was about 97,000, distributed in 1,936 clubs. Membership in 1946 was about 170,000, distributed in 2,550 clubs in the U.S., Canada and Alaska. Publications: the Kiwanis Magazine, the Monthly Club Bulletin and the Weekly Bulletin. Officers in 1946 were: J. N. Emerson, president; O. E. Peterson, secretary. Headquarters: 520 N. Michigan Ave., Chicago 11, Ill.

Knights of Columbus.—The Knights of Columbus, a fraternal benefit society of Catholic men chartered at New Haven, Conn., on March 29, 1882, had a membership of 638,435 on Dec. 31, 1946. There were 2.561 councils of the society located in the United States, Canada, Newfoundland, Cuba, Mexico, Puerto Rico and the Philippine Islands. The society continued to operate its own insurance system for its members and, at the end of 1946, had total insurance in force amounting to \$294.673,237.

At the annual meeting of the supreme council in 1944, an educational trust fund of \$1,000,000 was established for the purpose of providing a complete Catholic college education for sons and daughters of veterans killed or totally disabled in military service in World War II. The Knights of Columbus blood donors program, inaugurated in 1938, was effectively carried on in more than 1,000 of the society's councils in 1946. Members co-operating in the plan had contributed almost 40,000 pints of blood for emergency cases in which "live" transfusions were required.

Publication: Columbia (monthly), official organ of the society. Officers (1946) were: supreme knight, Judge John E. Swift; deputy supreme knight, Timothy P. Galvin; supreme secretary, Joseph F. Lamb, and supreme treasurer, Francis J. Heazel. National headquarters: P.O. Drawer 1670, New Haven 7, Conn.

Lions Clubs, International Association of.-Founded in

Chicago on June 7, 1917, the International Association of Lions Clubs became a union of businessmen's clubs with a primary objective "to create and foster a spirit of 'generous consideration' among the peoples of the world through a study of the problems of international relationships."

The idea of Lionism soon spread to other countries and in 1920, Lions clubs were established in Canada. Clubs were also formed in many Latin American countries and in China.

During the decade 1937–46 the growth of Lions International was substantial. As of June 30, 1936 (the close of the fiscal year), there were 2,725 Lions clubs in 8 countries with 85,539 members. As of Feb. 28, 1947, there were 5,828 Lions clubs in 18 nations and 314,308 members.

Lions clubs remained nonpolitical, nonsectarian civic units whose members had demonstrated leadership in business or the professions and interest in the welfare and development of their communities. During World War II Lions clubs in the U.S. and Canada co-operated with the Red Cross, civilian delense organizations and the United Service organizations. They also participated actively in war bond campaigns.

Publications: the Lion; El León (Spanish-language edition) and Lions International Monthly Letter. International president: Clifford D. Pierce; secretary general: Melvin Jones. Headquarters: 332 S. Michigan Ave., Chicago 4, Ill.

Masonic Fraternity.—Freemasonry was exported from England to the colonies in the early 18th century. Among the fundamental principles adhered to by U.S. masonic lodges were presence of the Holy Bible on the altar, belief in God, forbidding of political activity or discussion and nonsectarianism in religion. In 1936 the Masonic order was 1epresented by 50 grand lodges (one in each of the 48 states and one each for the District of Columbia and Puerto Rico). The total number of masonic lodges was 15,981 and the membership in that year was 2,709,105. On Jan. 1, 1946, while the number of lodges had been reduced to 15,210, membership had increased to 2,874,588.

The early part of the decade 1937–46 found the grand and local bodies of the Masonic order giving vigorous support to educational work. In 1938 the attacks on free-masonry by the German and Italian governments prompted leaders of English-speaking freemasonry to reiterate that one of the cardinal principles of freemasonry was abstention from political and religious controversies.

During World War II the U.S. Masons established close ties with members in the services through the agency of the Masonic Service association of the United States, with headquarters in Washington, D.C. The close of the war and the fact that many prospective members would be veterans who were crippled or maimed in action aroused intense debate in many grand and local lodges over the bars on physical qualifications for initiation. Although the controversy heightened in 1946, the trend seemed to be toward lowering the physical qualifications.

Music Library Association.—The principal aim of the Music Library association, organized in 1931, was to promote the establishment, growth and use of music libraries and collections of music throughout the country.

M.L.A.'s activities continued to be carried on by its executive board (consisting of its officers and two members-at-large), regional chapter chairmen and various committees; the latter conducted their work in the fields of relations between libraries in the U.S. and the Americas, photoduplication, personnel and employment and periodical indexing. The Music Library association became affili-

ated with the American Library association and was also a member of the National Music council and the Council of National Library associations. Membership in 1946 included about 400 individual and 150 institutional members.

Publications: Notes, a quarterly journal; Music and Libraries, a volume of selected papers presented at the 1942 meetings; Code for Cataloging Music and a supplementary chapter on cataloguing photograph records. Officers in 1946: H. Dorothy Tilly, president; Lowell P. Beveridge, vice-president; Mary R. Rogers, secretary-treasurer. Headquarters: the Library of Congress, Washington 25, D.C.

National Academy of Sciences.—The National Academy of Sciences was incorporated in 1863 by an act of congress approved by President Lincoln. The act of incorporation provided that "it shall, whenever called upon by any department of the government, investigate, examine, experiment and report upon any subject of science or art." The charter specified that the academy should not receive compensation for its services to the government, but it could be paid for expenses involved in making such investigations and reports.

Originally membership was limited to 50, although amendments in the succeeding years eventually extended it to a total of 450 and 50 foreign associates. On July 1, 1946, the Academy had 390 members, 6 members emeriti and 44 foreign associates.

The academy was divided into 11 sections: astronomy, physics, chemistry, engineering, mathematics, geology and palaeontology, botany, zoology and anatomy, physiology and pathology, anthropology and psychology. It continued to meet twice yearly, award medals for meritorious research and discoveries and issue grants for scientific service. The academy's endowment totalled \$3,550,000 in 1946.

During World War II the academy was engaged largely in government problems concerned with scientific matters related to the war. Its reports were confidential and its doors were closed to the public for the duration.

The academy continued to publish an annual report, scientific memoirs, biographical memoirs of deceased members and monthly proceedings devoted to condensed reports of scientific discoveries. Officers (1946) were: Frank B. Jewett, president; L. P. Eisenhart, vice-president; F. E. Wright, home secretary; Detlev W. Bronk, foreign secretary, and J. C. Hunsaker, treasurer. Headquarters: 2101 Constitution Ave. N.W., Washington 25, D.C.

National Association of Manufacturers.—Founded in 1895, the N.A.M. was organized for the promotion of industrial interests of the U.S., the fostering of domestic and foreign trade and dissemination of information to the public respecting furtherance of legislation supporting the principles of private enterprise. In 1932 N.A.M.'s membership was about 2,000; it increased to 16,000 in 1946. The association established six departments—taxation, industrial relations, economic security, public relations, research and law—and various committees. It issued a number of publications, including an annual report, NAM News, a weekly bulletin, and a weekly digest of labour rulings and decisions as well as books and pamphlets on economic, social, industrial and labour subjects.

During the 1937-46 decade the N.A.M. expanded its informational activities and urged, among other things, amendments of the Wagner act and the Wage Hour act. During World War II it was committed to a policy of stimulating management to maximum efforts in production for victory. After the close of the conflict, it waged an active campaign against continuance of the government program for price controls. At its convention in New

York city (Dec. 5, 1946), N.A.M. recommended legislation to minimize labour "abuses" without taking away the legitimate rights of labour to organize and bargain collectively. It also urged a 20% reduction in personal income taxes as of Jan. 1, 1947, and called on the federal government to reduce government expenditures with the eventual goal's being a budget of not more than \$20,000,000,000 annually.

N.A.M.'s president for 1947: Earl Bunting, head of the O'Sullivan Rubber company; Noel Sargent was secretary. Headquarters: 14 W. 49th St., New York, N.Y.

National Association of State Libraries.—One of the oldest organizations of its kind in the United States, the National Association of State Libraries was founded in 1889 to provide the information, data and recommendations required for improved organization and functioning of state libraries. In 1946 it had 43 institutional, 4 associate and 7 individual members as well as 1 honorary life member.

To assist in the cataloguing of state publications, the association continued to publish a series of check lists of session laws, statutes and state journals. A member of the Council of National Libraries, the association participated during World War II in the collection of large numbers of scientific and research publications scheduled for postwar distribution in devastated libraries in Europe and Africa.

Officers (1946): Dennis A. Dooley, president; Harold F. Brigham, first vice-president; Mrs. Mildred P. McKay, second vice-president. Secretary-treasurer: Alfred D. Keator, Pennsylvania State Library and Museum, Harrisburg, Pa.

National Education Association.—The N.E.A., founded in 1857, was "dedicated to the upbuilding of democratic civilization and supported by the loyal co-operation of the teachers of the United States to advance the interests of the teaching profession, promote the welfare of children and foster the education of all the people." The representative assembly of the association was composed of delegates from 52 affiliated state and territorial associations with 759.980 members and more than 1,550 local associations (1946 figures). Direct membership in the 1937–46 decade grew from about 200,000 in 1937 to 340,973 in 1946. Special branches of education were served by 29 departments, such as school administrators, classroom teachers and social studies.

During World War II N.E.A. co-operated with the U.S. Office of Education and other agencies in the war effort. It also played an important part in securing a place for education in the United Nations charter and later discussed measures for improving education and co-operation with the United Nations Educational, Scientific and Cultural organization. N.E.A., in addition, continued its active campaigning on behalf of increased salaries and improved working conditions for teachers and for correction of abuses in school systems.

Its official organ, the Journal of the National Education Association, continued to be issued to all members monthly except in June, July and August. Other publications included the annual volume of Proceedings, the Research Bulletin, The Public and Education (for laymen), NEA Handbook and NEA Handbook for Locals, a number of bulletins and yearbooks of departments and numerous special bulletins and reports.

President for 1946–47: Mrs. Pearl A. Wanamaker; Willard E. Givens, executive secretary. Headquarters: 1201 16th St. N.W., Washington 6, D.C.

National Geographic Society.—The National Geographic society, with headquarters in Washington D.C., was founded in 1888 "for the increase and diffusion of geographic knowledge," with only a few hundred members. The society's official publication, the illustrated monthly National Geographic Magazine, was sent to every member By 1937 the membership had grown to approximately 1000,000.

In the decade 1937–46 the membership expanded to 1500 000 During that period the society continued its notable series of scientific expeditions. In 1937 coloper ating with the U.S. navy, it sent an expedition to the mid Pacific Canton Island to photograph and study a total solar eclipse. The same year, joined by the Smithsonian institution, the society collected more than 1,000 wild animals and birds in the Netherlands Indies and southeast Asia, presenting them to the National Zoological park in Washington. The society also sent an expedition into Kwangsi province, south China, to study aboriginal tribes and to obtain specimens of flora and fauna.

In 1938 the society in co-operation with Cornell univer sity, Ithaca, NY, began a comprehensive investigation of auroras. In 1939 the society and the Smithsonian institution sent to the isthmus of Tehuantepec the first of eight annual expeditions to study the archaeology of the region.

In 1940 the society and the National Bureau of Standards sent a party of scientists to Patos in northeastern Brazil to observe a total eclipse of the sun A series of expeditions to study and photograph North American birds was begun in 1944 in nesting areas on the shores of Hudson bay The researches were continued in 1945 along the north shore of the Gulf of St Lawrence, and in 1946 in bird refuges along the coast of North and South Carolina and in Georgia Florida, Texas, northern Mexico and the Rocky mountains of the United States

The National Geographic society, the US army air forces and the Bartol Research foundation co-operated in the summer of 1946 in investigations of cosmic rays made from an instrument equipped B 29 bomber flying between the Canadian border and the equator at altitudes up to 35 000 ft.

During the 1937–46 decade the society published the following technical papers on the scientific results of expeditions The Stratosphere Flight of 1935 in the Balloon Explorer II (a joint expedition of the National Geo graphic society and the US army air forces), An Initial Series from Tres Zapotes, Veracruz, Mexico, The Solar Eclipse Expedition of 1940 to Brazil In this period there was a significant expansion of the society's production of maps More than 56 500 000 wall maps in colour of continents, oceans and other major regions of the earth were issued as supplements to the National Geographic Magazine and were distributed to the society's membership

During the war years the society made its fund of in formation and its facilities available to the armed forces to aid in solving military problems in various parts of the world. Intelligence officers from the U.S. army, navy and air forces and Allied armies were given access to more than 300 000 unpublished photographs of shore lines and of mountain, desert and jungle terrain. In addition, several million copies of the society's maps were requisitioned by the armed forces for use on land, sea and in the air

During the 10 year period, awards for achievement in the fields of geography and exploration included a special gold medal to Thomas C Poulter, second in command of the second Byrd Antarctic expedition, the Hubbard medal to Gen Henry H Arnold, USAAF, and Franklin L Burr prizes to Dr and Mrs William M. Mann, Bradford Washburn, Dr and Mrs Matthew W Stirling, Dr. Alexander Wetmore, Dr Lyman J Briggs and Dr Thomas A Jaggar

Officers Dr Gilbert Grosvenor, president since 1920 and editor of the National Geographic Magazine since 1903, John Oliver La Gorce, vice president and associate editor, Thomas W McKnew, secretary, and Robert V Fleming treasurer Headquarters 1146 16th St. NW, Washington 6 DC.

National Lawyers Guild.—The National Lawyers guild was founded in 1936 to unite the US lawyers into an organization which would function as an effective social force to the end "that human rights shall be regarded as more sacred than property rights" and to protect "our civil rights and liberties and our democratic institutions"

During World War II the guild gave free and voluntary legal assistance to members of the armed forces and their dependents, its plan for utilizing voluntary services of US attorneys in enforcement of rent and price ceilings was accepted by the Office of Price Administra tion The guild urged abolition of the poll tax, opposed the activities of the Dies committee and advocated punishment of war criminals. In 1945 the guild supported the veto power of the U N Security council and advocated establishment of a new world court. In 1946 it sought to unite democratic lawyers of the world to further development of international law as an instrumentality for maintaining world peace Officers in 1946 Robert W. Kenny, president, Robert J Silberstein, treasurer, and Martin Popper, executive secretary. Headquarters 902 20th St. NW, Washington, DC

National League of Women Voters.—Founded in 1920, the National League of Women Voters strove to inform and educate the citizenry on major political issues, promote the general welfare and urge the citizen to broaden participation in government

The league's program, nonpartisan, refrained from supporting or opposing any political candidate or party per se It continued to support only those measures or policies which it deemed in the public interest, irrespective of party labels

The organization in 1946 was composed of 525 affiliated leagues throughout the country. The local leagues conducted thousands of discussion groups on program items, ran campaigns to encourage a large and informed vote, did work in local government and engaged in numerous other activities. Toward the close of World War II the league advocated U.S. participation in the United Nations. On the domestic scene, it supported measures for curbing inflation, establishing a sound tax structure and developing a sickness insurance program.

Its membership in 1946 was put at 62,000 and its publications were *Trends in Government*, a biweekly news sheet, and *Action*, a bimonthly magazine

Officers in 1946 Anna Lord Strauss, president, Mrs. Harold A Stone, first vice-president, Mrs. Marc A. Law, second vice president, Mrs. James G. Scarborough, secretary, and Mrs. Leonard Haas, treasurer. Headquarters: 726 Jackson place, Washington 6, D.C.

Parents and Teachers, National Congress of.—The National Congress of Parents and Teachers, often known as the PTA, was founded on Feb. 17, 1897, as the National Congress of Mothers

Later broadened to include both parents and teachers,

the organization by 1936 had attracted to its ranks about 2,000,000 adults. By 1946 that membership was nearly doubled, and on April 15 of that year there were 3,910,106 members in 27,000 parent-teacher associations in the 48 states, the District of Columbia and Hawaii. Of this number, 1,130,800 were men and 402,000 were teachers.

The program of the congress was dedicated to the protection of children and youth. Its activities continued to be developed through 30 national standing committees and their counterparts at state and local levels. Parent education, health, juvenile protection, music, art, safety, mental hygiene and recreation were but a few of the many fields of endeavour carried on by the congress. As one means of improving the public schools, P.T.A. members worked consistently toward enactment of a measure providing federal aid for education. During the 1937–46 decade they made a united effort to alleviate the growing shortage of teachers and succeeded in awakening the nation to the critical situation.

A major P.T.A. project in many communities was the sponsoring of school lunches. The federal school lunch bill was passed in 1946 largely because parent-teacher members worked so diligently for its enactment.

Parent education, long a part of the parent-teacher work, was greatly broadened in the 1937–46 period; and thousands of local associations, both urban and rural, fostered the development of an enlightened U.S. parent-hood.

Publications: National Parent-Teacher, official P.T.A. magazine; the National Congress Bulletin, a monthly newssheet, and numerous books, pamphlets and other informational material.

In 1945 the P.T.A. was one of four educational organizations invited by the state department to send a consultant to the San Francisco conference. In 1946 parent-teacher units made every effort to acquaint their members with the structure and purpose of the United Nations Educational, Scientific and Cultural organization, the Commission on Human Rights and other groups operating within the framework of the United Nations.

Officers (1946): Mrs. L. W. Hughes, president; Mrs. John E. Hayes, first vice-president; Charles W. Phillips, second vice-president; Mrs. Gertrude E. Flyte, secretary; G. L. Maxwell, treasurer, and Mrs. A. H. Reeve, honorary president. National headquarters: 600 S. Michigan blvd., Chicago 5, Ill.

Performing Right Societies.—Performing Right Societies throughout the world became affiliated with a central body, the International Confederation of Performing Right Societies, which in turn consisted of four international federations having to do with: (1) dramatic performing rights; (2) musical performing rights; (3) recording rights and (4) rights in general of literary persons (gens des lettres). The Second federation, which united with the parent body in 1927, comprised in 1946 about 25 national societies administering music-performing rights of their members. The American Society of Composers, Authors and Publishers (A.S.C.A.P.) was the only U.S. affiliate of the Second federation and also the sole U.S. unit within the framework of the confederation.

Annual congresses of the confederation were held in 1937 at Paris and in 1938 at Stockholm, Sweden. World War II interrupted these congresses, and no further meeting was held until March 1946, when a session took place in Paris, at which steps were taken for postwar reorganization and resumption of formal annual congresses. An interim meeting took place at Washington, D.C., Oct. 21–26, 1946, the first meeting of the confederation in the U.S.,

at which an agenda for the formal congress scheduled for London in 1947 was prepared.

While the war disrupted the international co-operation of the performing right societies, they continued to function within their respective countries. In the western hemisphere, such organizations progressed steadily and during the 10-year period the American Society of Composers, Authors and Publishers expanded to become the chief such society, with a membership of more than 2,000 and with more than 30,000 licencees. There was a drop of 10% in licences during the war, but with the resumption of normal activities, the number of licences quickly returned to the former figures. The income from commercial performance of music in radio surpassed that from any other source.

Gene Buck served as president of A.S.C.A.P. from 1924 to 1941, when he was made president emeritus, to be succeeded by Deems Taylor. After 1943, A.S.C.A.P. was increasingly active in the standard music field. Prior to that time it had administered performing rights chiefly in the popular and production fields. General offices of A.S.C.A.P.: 30 Rockefeller plaza, New York 20, N.Y.

Research Libraries, Association of.—The Association of Research Libraries was founded in Jan. 1933 by delegates of 43 research libraries of the United States and Canada. Membership was eventually expanded to 47, but in 1946 the existing members voted to reduce the participating libraries to the 45 most important research institutions.

The association continued to hold two meetings annually for discussion of topics of interest to research librarians. In 1946 publication was completed on the Catalog of Library of Congress Cards, in 164 vol., compiled under the association's auspices; and plans were made for publishing a photo-offset reprint of the British Museum catalog in 40 vol. Also published under the association's auspices was the annual volume of Doctoral Dissertations Accepted by American Universities. Executive secretary: Paul North Rice. Headquarters: New York Public library, New York 18, N.Y.

Rockefeller Foundation.—Founded in 1913 as a permanent institution, the Rockefeller foundation was consecrated to "promoting the well-being of mankind throughout the world." Specifically, it gave active assistance to the extension and application of knowledge in certain fields of the medical, natural and social sciences, the humanities and public health. Save for its limited activities in public health, the Rockefeller foundation was not an operational agency and its work was generally limited to support of other agencies and to training, through postdoctoral fellowships, of skilled personnel in the various fields of knowledge.

Funds and assets of the foundation as of Dec. 31, 1945, totalled \$147,064,222 and appropriations for its work during the period between 1937 and 1945 inclusive totalled \$90,947,600.

Publications: the *President's Review*, a brief illustrated account of the year's work, and the *Annual Report*. The officers in 1946 were: Walter W. Stewart, chairman of the board of trustees; Raymond B. Fosdick, president, and Norma S. Thompson, secretary.

General Education Board.—The second largest of the benevolent organizations set up by John D. Rockefeller, the General Education board had an original endowment of \$129,000,000. The board, which was incorporated by an act of congress in 1903, aimed at promotion of education within the United States without distinction of race, sex

or creed.

Its resources were being concentrated mostly in connection with three types of activities: the continuance of the existing program in the southern states, support of research and experimentation with regard to problems in general education and a program of child growth and development.

Between 1937 and 1945, the General Education board appropriated about \$33,821,000 for work in its various fields.

Officers (1946) were: Walter W. Stewart, chairman of the board of trustees; Raymond B. Fosdick, president, and Norma S. Thompson, secretary. Headquarters: 49 W. 49th St., New York 20, N.Y.

Rosenwald Fund.—The Julius Rosenwald fund was established in 1917; under its provisions trustees were permitted to spend capital as well as income and were required to expend all the funds within 25 years of the death of its founder, that is, before Jan. 6, 1957. In 1946 total payment of funds on its several programs since inception of the organization totalled \$20,120,382. Funds spent in the years 1936–46 totalled \$6,883,786. At the close of the fiscal year, June 30, 1946, the value of capital assets was about \$2,500,000.

During its early years, the chief function of the fund was aid in building rural public schools for Negroes. Later, its programs were extended to include improvement of the content of education for both whites and Negroes in the south; aid in building up four important centres of higher education for Negroes: Howard university, Washington, D.C.; Atlanta university, Atlanta, Ga.; Fisk university, Nashville, Tenn., and Dillard university, New Orleans, La.

Other projects undertaken by the fund were efforts in behalf of Negro health and establishment of a series of fellowships for Negroes and white southerners and efforts to improve race relations, especially relations between U.S. white and Negro citizens. Officers at the end of 1946 were: Lessing J. Rosenwald, chairman of the board of trustees; Edwin R. Embree, president, and Dorothy A. Elvidge, secretary and comptroller. Headquarters: 4901 Ellis Ave., Chicago 15, Ill.

Rotary International.—A world-wide organization of Rotary clubs, founded in 1905, was made up of groups of representative men for the purpose of furthering co-operation and goodwill in business and community life. On July 29, 1946, there were 5,842 Rotary clubs with about 280,000 members in about 70 different countries.

During World War II Rotary clubs emphasized development of plans for the economic and social readjustment of returning servicemen and clubs in the U.S. and Canada. Rotary International continued its welfare activities on a national level, and its programs included community improvement undertakings, work for crippled and underprivileged children and promotion of high ethical standards in business and professional life.

Rotary clubs also actively co-operated with their governments in rationing, salvaging and fund-raising campaigns and engaged in activities to alleviate war suffering. The organization's activities in 1945 included a program to promote an understanding of the United Nations charter. Publications: the Rotarian and its Spanish-language edition Revista Rotaria. Officers (1946–47): president, Richard C. Hedke, U.S.A.; first vice-president, Charles Jourdan-Gassin, France; second vice-president, B. T. Thakur, India; third vice-president, Carl E. Bolte, U.S.A.; secre-

tary, Philip Lovejoy, U.S.A.; treasurer, Richard E. Vernor, U.S.A. Rotary International headquarters: 35 E. Wacker drive, Chicago 1, Ill.; with additional offices in Zurich, Switzerland, London, England, and Bombay, India.

Russell Sage Foundation.—Established in 1907, the Russell Sage foundation had an endowment of \$15,000,000 at the end of 1946. General objectives of the foundation were to study causes of adverse social and living conditions in the United States and to make public information to correct or prevent these maladjustments. Divided into various departments to carry on its work, the foundation employed about 70% of its income to this purpose; and the remaining 30% was generally given as grants to organizations with similar aims.

In the years 1937–46, the Russell Sage foundation gave increasing aid to such activities as adult education, city or regional planning, housing improvement, family welfare, education and training for social work, child welfare and prevention of delinquency, social welfare publications, improvement of race relations, control of consumer credit, methods of relief, work relations in industry, social statistics and increasing public understanding of social work.

It continued to issue the Social Work Year Book, an annual edited by Russell Harold Kurtz. Officers (1946): president, Morris Hadley; vice-president, Joseph P. Chamberlain; secretary, John M. Glenn; treasurer, Arthur H. Ham. Headquarters: 130 E. 22d St., New York 10, N.Y.

Society of the Cincinnati.—Founded in 1783 by officers of the Continental army, with George Washington as first president general, the Society of the Cincinnati became the oldest military association of the United States. Its objectives were to care for the needy and to encourage patriotism. Membership was made hereditary, with the eldest son succeeding to membership upon the death of his father. Total membership in 1946 was about 1,500.

General officers (1946): Col. Bryce Metcall, president general; Col. Edgar Erskine Hume, vice-president general; Francis A. Foster, secretary general; William Marbury Beall, assistant secretary general; Horace Morrison, treasurer general, and Lawrence Monck Pinckney, assistant treasurer general. Headquarters: Anderson House, 2118 Massachusetts Ave. N.W., Washington, D.C.

Sodality of Our Lady.—Founded in Rome in 1563, the Sodality of Our Lady's purposes, embodied in the first rule of the sodality, were stated as the "fostering in its members an ardent devotion, reverence and filial love towards the Blessed Virgin Mary. . . . It seeks to make the faithful . . . good Catholics, sincerely bent on sanctifying themselves." The Sodality of Our Lady was first established in the United States in 1810 at Georgetown college, Washington, D.C.

During the 1937–46 decade, the affiliated sodalities in the U.S. grew in number from 10,351 to 13,956. The U.S. active membership in 1946 was estimated at between 1,000,000 and 1,500,000. The sodality continued to disseminate its teachings through its Queen's Work press and the Institute of Social Order, the latter operated through 6,000 Jesuits in the U.S. Courses in more than 50 Summer Schools of Catholic Action (started in 1931) were conducted by staff members in all parts of North America to teach "the what, how and why of Catholic living."

Among the Sodality publications: the Queen's Work (monthly); Directors' Bulletin; Sodality Union News; Faculty Adviser; the Semester Outline and during the war the Chaplain's Service. The central secretariat was manned by 8 Jesuits and about 75 of the laity.

Special Libraries Association.—The Special Libraries association was founded in 1909 as an international body

of librarians and information expens in libraries of specialized knowledge pertaining to business, industrial and related organizations. Membership totalled about 4,500 at the end of 1946. The association had 21 chapters in the United States and 2 in Canada. Publications: Special Libraries, published monthly from September to April and bimonthly from May to August, and the Technical Book Review Index, published 10 times annually. Vol. I of Special Library Resources was published in 1941 and vol. II in 1946.

After the close of World War II, the association's International Relations committee established contact with libraries and librarians overseas to exchange information and materials of mutual benefit. Officers (1946) were: president, Betty Joy Cole; treasurer, Paul Gay; directors, Dr. Mary Duncan Carter, Melvin J. Voigt and Elma Evans. Executive office: 31 E. 10th St., New York 3, N.Y.

Spelman Fund of New York.—Incorporated in 1928, the Spelman fund was formed for "exclusively charitable, scientific and educational purposes." These included the advancement and diffusion of knowledge concerning child life, the improvement of inter-racial relations and co-operation with public agencies.

The fund's program during the 1937–46 decade was directed toward co-operation with public agencies for advancing public administration. Its interest in this field was expressed through its support of activities of public and quasipublic agencies engaged in making public significant results of administrative experience, in developing improved methods and putting them to practical use and in experimenting with new devices and procedures under actual operating conditions.

Theatre Library Association.—An organization of persons in libraries and museums as well as private collectors and members of the theatrical profession, the Theatre Library association was founded in New York city in 1937 to preserve and make accessible to the public the records of the drama and kindred fields of entertainment. Membership, which was 47 at the time of its founding, grew by 1946 to 163. In 1940 the association published *Broadside*, a news sheet appearing at irregular intervals; in 1942 Theatre Annual, a yearly publication, was first issued. Officers: president, George Freedley, Theatre Collection, New York Public Library, 476 Fifth Ave., New York 18, N.Y.; treasurer, Elizabeth P. Barrett, and secretary, Sarah Chokla Gross.

Twentieth Century Fund.—Founded in 1919 by Edward A. Filene, the foundation served as a disbursing agency during its early years. After 1929 the fund experimented with surveys on important economic problems. During the 1937-38 fiscal year the organization's trustees voted to end grants to outside agencies and to devote the fund's entire income to its own work on economic research and publication. Up to the start of World War II studies of U.S. domestic economic problems of a controversial nature were stressed. Internal defense problems dominated the publications issued between 1939 and 1941. Outstanding among publications issued during World War II were the Stuart Chase reports which stressed the difficulties and opportunities that would crop up in the U.S. in the postwar era. In addition, the Twentieth Century fund published a number of public affairs pamphlets and collaborated with Encyclopædia Britannica Films Inc., in distributing adult educational films.

The fund also carried on, during the war, intensive research and an educational program on basic problems of postwar reconstruction in the U.S. In progress during 1945 and 1946 were surveys of foreign economic relations

of the U.S., cartel arrangements in world trade and monopoly problems in domestic business. Officers (1946): president, John H. Fahey; chairman of executive committee, Henry S. Dennison; treasurer, Morris E. Leeds; executive director, Evans Clark. Headquarters: 300 W. 42d St., New York 18, N.Y.

Veterans of Foreign Wars.—The Veterans of Foreign Wars was founded in 1899 by a group of 13 Spanish-American War veterans at Columbus, O. In succeeding years, veterans who fought in the Boxer rebellion, the Philippine insurrection, World War I, the Nicaraguan and other armed expeditions and World War II joined the organization. Membership in 1936 was 250,000; its claimed membership 10 years later was more than 2,000,000.

Objectives of the V.F.W. were defined as follows: to strengthen comradeship between war veterans, to assist worthy comrades and their widows, to maintain allegiance to the United States and to its constitution and laws, to extend institutions of U.S. freedom and to preserve and defend the United States in case of attack.

The association was organized into three principal divisions with the central administrative authority lodged in the national headquarters in Washington, D.C. Next in the administrative hierarchy were the departments—one for each state as well as departments for the District of Columbia, the Canal Zone and Hawaii. The smallest administrative unit was the local post.

The V.F.W. consistently urged the federal government to accept the responsibility for all disabled veterans and their dependents as well as the dependents of deceased veterans. It actively sought congressional and public recognition of its contention that service in the armed forces overseas merited special legislative treatment and consideration.

In 1945-46 membership in the V.F.W. increased substantially, with the majority of members being veterans of World War II. After the war the V.F.W. endorsed peacetime compulsory military training, government control of atomic research and U.S. participation in the United Nations. On domestic affairs, the organization urged congress to seek a high level of full employment through use of free enterprise. On veterans' affairs, V.F.W. recommended adjusted service pay for all World War II veterans and liberalizing the G.I. Bill of Rights. Publications: Foreign Service, a monthly magazine, and the V.F.W. National News, a monthly newspaper. Officers (1946-47): Louis E. Starr, commander in chief; Ray H. Brannaman, senior vice-commander in chief, and Lyall T. Beggs, junior vice-commander in chief. National headquarters: 406 W. 34th St., Kansas City 2, Mo.

Woman's Christian Temperance Union .- Organized in 1874, the National Woman's Christian Temperance union actively campaigned to advance education on the evils of addiction to alcoholic beverages and raised for this purpose a national temperance education fund totalling nearly \$1,000,000. Membership in the organization in 1946 was put at about 400,000 in 8,000 local unions in the United States, Alaska, Puerto Rico, Hawaii and the Virgin Islands. W.C.T.U. continued to hold annual organization workshops in Evanston, Ill., for training of officers, department heads and organizers. Summer seminars on narcotic education were given at Evanston and at Chautauqua, N.Y. Publications: the Union Signal, weekly; the Young Crusader, a monthly magazine for children; an annual report; a yearly handbook, and numerous educational pamphlets.

It added more than 131,300 new members to its rolls between 1938 and 1941. After the outbreak of World War II, W.C.T.U. augmented its department of work for soldiers and sailors.

Officers of the National W.C.T.U. (1946) were: Mrs. D. Leigh Colvin, president; Mary B. Ervin, vice-president; Violet T. Black, treasurer, and Lily Grace Matheson, corresponding secretary. Headquarters: 1730 Chicago Ave., Evanston. III.

Women's Clubs, General Federation of.—Founded in 1890, the General Federation of Women's Clubs in 1946 comprised a membership of about 3,000,000 women in 16,500 clubs located throughout the United States and its territories and in 31 foreign countries. There were 50 state federations (including the District of Columbia and Alaska) and 20 affiliated organizations. Objectives of the federation were defined as follows: to unite women's clubs and similar organizations throughout the world for promotion of education, philanthropy, public welfare, moral values, civics and fine arts.

After U.S. entry into World War II, member clubs of the general federation participated in innumerable activities of assistance to the war effort.

Publication: the General Federation Clubwoman, published monthly (except in June, July and August). Officers (1946): Mrs. LaFell Dickinson, president; Mrs. J. L. Blair Buck, first vice-president; Mrs. Hiram C. Houghton, second vice-president; Mrs. Oscar A. Ahlgren, recording secretary, and Mrs. Volney W. Taylor, treasurer. National headquarters: 1734 N. St. N.W., Washington, D.C.

World League Against Alcoholism.—The World League Against Alcoholism was founded in Washington, D.C., in June 1919. Its objective was set forth in its constitution as follows: "to attain, by the means of education, the total suppression throughout the world of alcoholism, which is the poisoning of body, germ-plasm, mind, conduct and society produced by the consumption of alcoholic beverages." The league carried on its work by distribution of periodicals, books, pamphlets, tracts and other material dealing with the problem of alcoholism and by lectures and leadership in young people's camps and institutes. To aid its program, the league established a reference library and information bureau. During World War II more than 500,000 copies of the special army series of leaflets were distributed among servicemen. Publications: the American Issue, Scientific Temperance Journal and the International Student.

Officers (1946): Ernest H. Cherrington, general secretary, and Harry B. Sowers, treasurer. Headquarters: Westerville, O.

Zonta International.—An organization of executive business and professional women selected on a classified basis, Zonta International was founded in 1919. In 1946 it comprised about 160 clubs in the United States, Canada, Hawaii, Denmark, Iceland and Sweden with about 5.500 members.

Principal objectives were defined as: community service; fostering of high ethical standards in business and the professions; improvement of the status of women and advancement of international understanding.

In 1939 Zonta established the Amelia Earhart scholarship, an award given exclusively to a qualified young woman in any country where Zonta clubs had been established, for graduate work in aeronautics. Official publication: the Zontian, a monthly. Officers (1946): Louise C. Grace, president; Ruth H. Gates, treasurer; Harriet C.

Richards, executive secretary. International headquarters: 59 E. Van Buren St., Chicago, Ill.

Great Britain

Associated Learned Societies of Liverpool and District.—The triennial exhibition was held in Oct. 1938 at the City of Liverpool Technical college. During World War II activities were restricted, but in 1943 a small exhibition was held in the botanical laboratory of the university. By 1946 there were 15 associated societies.

British Association for the Advancement of Science.-In 1937 the annual meeting was held at Nottingham, and a delegation of 100 members left for Calcutta, India, to attend the silver jubilee of the Indian Science Congress association. The 1938 annual meeting was held at Cambridge, England, and the 1939 meeting, cut short by the imminence of war, at Dundee, Scotland. During the following years the annual meetings were discontinued, but the division for the social and international relations of science (founded in Aug. 1938) continued to carry out much of the association's work. A conference was held in London and at the Rothamsted experimental station in Sept. 1941, and further conferences took place in London in 1942 and 1943. One result of the 1941 conference was the establishment of a committee on postwar university education, which presented its report in 1944. In Dec. 1944 the division, in conjunction with the Indian group of the Royal Institute of International Affairs, held a conference for the Indian Scientific delegation. A conference on the place of science in industry was held in Jan. 1945. another on the dissemination of scientific information to the public in July 1946, in collaboration with the Royal society. On July 20, 1946, the first postwar annual meeting was held, presided over by Sir Richard Gregory, who had remained in office throughout the war.

British Medical Association.—In 1938 the association reissued its 1931 publication, General Medical Service for the Nation, and in 1941 appointed a medical planning commission to consider postwar reconstruction of medical services, the draft interim report of which was issued in 1943. A representative committee was appointed in 1944 to consider the government's White Paper on a national health service, and in 1945 a negotiating committee was established which discussed with the coalition government the form of a National Health Service bill. With regard to international medical relations, the association held an exploratory conference of individual medical practitioners in June 1945 to arrange a closer liaison for the medical profession in different countries; in Sept. 1946 an international medical conference was organized in London composed of delegates and observers sent by medical associations throughout the world. Thirty-one nations were represented, and the conference established a World Medical association to meet in Paris in 1947. The British Medical association set aside the sum of $f_{10,000}$ for the provision of B.M.A. lectures in other countries, to be given by distinguished British practitioners. Among the association's publications during the years 1937-46 were: Industrial Health in Factories (1941), Report of Committee on Mental Health (1941), The Returning Doctor (1945), Report on Rehabilitation (1946) and A Charter for Health (1946). At the request of the government, the association undertook the recruitment of all medical practitioners to the forces, appointing a central medical war committee and establishing an emergency register of all practitioners in the country.

Chemical Society.—At the outbreak of World War II the society assisted the government in compiling the list

of chemists on the central register for national service and later gave advice on chemical problems through the Advisory Research council. The centenary of the society fell in 1941, and postponed celebrations were to take place in 1947.

Faraday Society.—Bombed out of its old premises in 1941, the society moved to Grays Inn Square, London. During World War II its publications continued and its membership increased. Two meetings a year were held for general discussion. The meeting in Sept. 1946 took place in London under the presidency of Prof. W. E. Garner, the subject being "Shrinking and Swelling." A legacy left to the society by Lieut. Col. E. A. Bourke made possible the establishment of a fund for the entertainment of foreign visitors.

Institute of Physics.-Conferences on industrial physics were held at Birmingham in 1937 and at Leeds in 1939. In 1938 a summer school took place at Reading university informing members and others on advances in pure and applied physics. On the outbreak of World War II the institute moved to Reading university, returning in July 1946 to new premises in London. In Nov. 1941 the board appointed a planning committee, which gave immediate attention to the training of wartime physicists and their conditions of employment; and in Oct. 1942 a conference was held in London to consider problems of postwar training and education. Among activities of the institute during 1946 were the summer meeting of the London and Home Counties branch at the Dunstable station of the meteorological office and a summer school on "Applications of Theoretical Physics in Industry," held in co-operation with the University of Bristol.

Library Association.—The 60th annual meeting of the association was held at Scarborough in 1937 under the presidency of the archbishop of York (Dr. William Temple). The meeting for 1938 took place at Portsmouth and Southsea and for 1939 at Liverpool. Additional responsibilities were assumed in World War II. Steps were taken to link up the information services of public libraries with the ministry of information. The council set up a sub-committee to examine the possibilities of providing libraries for the armed forces, and in collaboration with the Lord Mayor of London's committee distributed millions of books and periodicals to the troops. The association was also represented on the Central Council (and some regional committees) for Adult Education in H. M. Forces. Sound foundations for postwar librarianship were planned. Many libraries were severely damaged in air raids, but efforts made through the National Book Recovery campaign resulted in the salvaging of nearly 2,000,000 books. An important postwar project was the establishment of schools of librarianship at technical institutions. The annual meeting for 1946 was held at Blackpool under the presidency of Dr. Arundell Esdaile, who later retired after holding office for seven years.

Linnean Society.—The 150th anniversary of the society was celebrated in May 1938, the meeting being held under the presidency of J. Ramsbottom. Queen Mary graciously consented to accept honorary membership. During World War II part of the society's library was removed to Oxford, and the collections were housed for safety at Woburn Abbey, home of the duke of Bedford. There they were photographed, and complete sets of the Collections of Linnaeus were sent to Sweden.

London Scientific Film Society.—The society was founded in 1937 to provide programs of general scientific and technical films for its members and to encourage the wider use of the film in science and education. Membership was

restricted during World War II but was later reopened; scientific films were exhibited by the society at the Scala theatre, London.

National Farmers' Union.—In 1938 a delegation from the union attended the first empire producers' conference at Sydney, Australia. At home the union was closely concerned with the government's marketing schemes for milk, bacon pigs, potatoes and hops. During World War II the union collaborated with the war agricultural emergency committees in the effort to produce more food and later had to face the problems of world shortage. A farm accounts scheme was developed under which qualified accountants collected facts for use when farm prices were discussed with the government. Close relations were maintained with foreign agricultural bodies, and in May 1946 the union organized an international conference of primary producers, which resulted in the formation of the International Federation of Agricultural Producers.

National Institute of Economic and Social Research.—The institute was founded in 1938, and special committees were set up to deal with special research for two-year periods. Publication of the first completed studies was planned for 1939 and 1940, but the course of events made this impossible; after a temporary suspension it was decided in Dec. 1939 that the institute should continue its activities. The research staff was increased and the scope of work expanded, arrangements being made with the Cambridge University press for publication of the institute's findings. The acting secretary of the institute became secretary of the National Service Committee for Social, Economic and Statistical Research set up by the ministry of labour.

National Institute of Industrial Psychology.—With the outbreak of World War II, the institute's work was considerably changed. The majority of the firms for whom investigations had been carried out were engaged in war production, and the introduction of training schemes for new workers took first place. The institute co-operated with the air ministry in the training of gunners in the royal air force. Nevertheless, consultations continued to be given annually by the Vocational Guidance department, and as far as possible industrial investigations were also carried out.

Royal Academy of Arts.—Attendances at the summer exhibitions fell off during the early years of World War II but in 1945, when the exhibition contained the state portraits of the king and queen by Sir Gerald Kelly, rose to 200,287, as against 96,276 in 1939. The attendance for 1946 was 197,457. Subjects of the winter exhibitions were: British architecture 1937; 17th-century art in Europe 1938; Scottish art 1939. In 1940, 25 art societies collaborated in an exhibition in aid of the Red Cross society and the Artists' General Benevolent institution, repeated in 1942 and 1943. No winter exhibition was held in 1941 because of bomb damage to the galleries. Other exhibitions included those of paintings by firemen artists, (1942-43-44), of war photographs (1942), Yugoslav art (1944), soviet graphic art (1945); and in Oct. and Nov. 1945 the galleries were given over to an exhibition of national war pictures. Selections from the summer exhibitions were sent on tour annually from 1942 to 1945 by the Council for the Encouragement of Music and the Arts; and organizations which held their own exhibitions in the galleries included the Royal Institute of Oil Painters, the Royal Society of Painters in Water Colours, the Royal Society of Portrait Painters, the London group and the New English

Art club. The painting and drawing schools and the sculpture school were re-opened in 1946. In 1938 Sir Edwin Lutyens was elected president and on his death on Jan. 1, 1944, was succeeded by A. J. Munnings.

Royal Empire Society.—Weekly meetings were held throughout World War II. Although badly damaged by air attack in 1941, the library, containing more than 500,000 books and pamphlets, remained open to all accredited students and was used by several government departments. More than 100 daily papers from various parts of the empire were available; and political, industrial and economic study groups were organized, their conclusions being published in pamphlet form. In 1942 the society celebrated its 75th anniversary.

Royal Geographical Society. - In 1937 the British Graham Land expedition returned after two-and-a-half years in the antarctic, and the following year its work was recognized by the award of the Founder's medal to the leader, John Rymill. Ronald Kaulback, accompanied by N. J. F. Hanbury-Tracy, completed explorations of the Salween valley and surrounding areas in southeast Tibet. In 1938 the Mount Everest expedition, led by H. W. Tilman, was sent out by the society and the Alpine club, but was forced by adverse weather to abandon its efforts. A delegation attended the International Geographical congress at Amsterdam, the Netherlands, in the same year. Successive presidents of the society were: Field-Marshal Sir Philip Chetwode, elected on the death of Prof. Henry Balfour in 1939; the Rt. Hon. Sir George Clerk, elected 1941, and the Rt. Hon. Lord Rennell of Rodd, elected 1945. World War II put an end to expeditions, but the expedition fund was maintained. Much of the experience gained by fellows was turned to good use, as in work done by desert travellers in the Libyan campaign. On behalf of the British council the society undertook the making of a map of the middle east, with English and Arabic editions.

Royal Institute of Chemistry.—In March 1944 the name of the institute was changed by royal charter from "Institute of Chemistry" to Royal Institute of Chemistry, and all fellows and associates were authorized to use the initials F.R.I.C. and A.R.I.C. respectively. Assistance was given to the government in World War II. Later, the institute collaborated with the Institute of Physics and the Joint Council of Professional Scientists in preparing a statement on "Principles of a Suggested Code of Practice in Respect of Consulting Work Carried Out by Academic Scientists."

Royal Institution.—During World War II the institution continued its Friday evening discourses and public afternoon lectures. The juvenile Christmas lectures were discontinued from 1939 to the winter of 1943–44. In 1941 Sir William Bragg gave three lectures to cadets of the Air Training corps on "The Story of Electro-Magnetism," and on his death the following year was succeeded as Fullerton professor of chemistry and director of the Faraday research laboratory by Sir Henry Dale. In 1944 Lord Eustace Percy was succeeded as president by Lord Rayleigh; and in 1945 Sir Henry Spencer Jones, the astronomer royal, was appointed professor of astronomy in succession to Sir James Jeans.

The Royal Society.—In 1938 it was decided to admit 20 new fellows annually instead of 17. The Pilgrim trust offered 250 guineas annually for 6 years to allow lectures to be given alternately in London and Washington in conjunction with the National Academy of Science. The council, through the development committee, granted capital expenditure of £5,100 and £3.500 per annum to cover

intensive study of the Gull stream and Atlantic drift and their effect upon fisheries in British waters. In 1940 Sir Henry Dale became president on the retirement of Sir William Bragg; a scientific advisory committee to the war cabinet was set up under Lord Hankey. In Oct. 1941 the society held a conference with United States and empire representatives, resulting in the establishment of the British Commonwealth Science committee; and in 1942 the secretary of state for air invited the society to co-operate in the newly established Meteorological Research committee. The advisory committees on air-bonne research facilities and naval research facilities gave their assistance to the government. At the instigation of Sir R. Fowler and Professor Patrick M. Blackett, the Committee on the Needs of Research in Fundamental Sciences was established. In 1945 women were admitted to the fellowship of the society for the first time.

Royal Society of Arts.—In 1936 the council of the society, feeling that industrial art had not received due recognition, instituted the distinction of Designer for Industry of the Royal Society of Arts, designated by the letters R.D.I. This honour could not be held by more than 40 designers at the same time. In Sept. 1944 the War Memorials Advisory council was set up. In Aug. 1944 Viscount Bennett, former prime minister of Canada, who was later elected president of the society, instituted the R. B. Bennett Empire prize of £1,500 for the promotion of arts, industry and commerce. The Albert medal was awarded annually; among the distinguished persons honoured were Queen Mary (1938), President Roosevelt (1941) and Winston Churchill (1945).

Royal Society of Edinburgh.—Full sessions of meetings were held throughout World War II. The library was extensively used by fellows, research workers and a number of government departments; the admiralty in particular received assistance from it.

Canada

Canadian Historical Association.—A resolution passed at the annual meeting for 1940 concerning the preservation of wartime material of historical value was sent to the secretary of state and the prime ministers of the dominion and its provinces. It was also embodied in a statement on "Historical Records and the Canadian War Effort," published in the Canadian Historical Review. A series of broadcasts on historical subjects was arranged by the association's radio committee and the Canadian Broadcasting corporation.

National Research Council.-In 1938 the division of biology and agriculture undertook research in the curing of bacon for the British market and in refrigeration of meat. Other subjects of research were tests of water skis for aircraft, methods of fighting forest fires and experiments in cathode ray direction finding. A fund to further the council's war efforts was opened in commemoration of Sir Frederick Banting, and a sum of more than \$1,000,-000 was raised by public subscription. In 1941 the council was officially designated a station of the royal Canadian navy, army and air force, and shown as a civil establishment in the records of the department of national defense. Three service committees were set up in 1942 to deal with aviation medical research, navy medical research and army medical research. In 1943-44 an extension of the scholarship system under war appropriations enabled the council to carry out work in many fields.

Royal Canadian Institute.—Lectures were given by members of government departments, the navy, army and air force and other organizations. In 1943 a committee was

formed to draw up plans for the institute's centenary celebrations, scheduled to be held in 1949.

Royal Society of Canada.—Although the cultural and scientific activities of the society continued during World War II, additional work was undertaken along lines similar to that of the National Research council, with which close collaboration was maintained.

The society's research fellowships were suspended for the duration of the war, with effect from Oct. 1942.

Sociology

The course of sociology during the decade 1937–46 was one of consolidation and expansion rather than of innovation. No strikingly new variants in sociological theory, methodology or technique appeared, but extremes were either eliminated or crystallized into forms of lessening adaptability and influence, and modes of analysis and interpretation not marked by single-factor fallacies slowly gained the upper hand. It was in part because of this drift toward what in political analogy might be termed the "centre" that one of the most striking manifestations was due; namely, the fusing of selected aspects of sociology, social psychology, social and cultural anthropology and social psychiatry into a reasonably well-integrated whole which could with warrant bear the name of the science of social relations.

Value-System Approach.-One of the most interesting developments was the full realization of the significance of values in social life. Indeed, the analysis of value-systems became a favourite approach. Implied in the far earlier work of Ferdinand Tönnies, Emile Durkheim, Vilfred Pareto, C. H. Cooley, Florian Znaniecki, G. H. Mead, Sigmund Freud and literally dozens of other students of social life, it was made explicit by Robert Redfield, Talcott Parsons, Pitirim Sorokin, R. C. Angell, Howard Becker, Morris Opler, Ralph Linton, Ruth Benedict, Karen Horney, Erich Fromm and many other contemporary researchers. This was the more surprising in view of the extreme behaviourism which threatened to dominate the sociological scene in the '20s and the larger part of the '30s, and according to which the more complex value-systems were mere "speech-reactions" of utterly insignificant or even epiphenomenal character. The impact of those valuesystems popularly called ideologies and "isms" during the decade 1937-46 doubtless did much to show the utter insufficiency of the sociological brand of white-rat behaviourism, but the actual scientific demonstration of its shortcomings was at least equally important. George Lundberg, S. C. Dodd and their followers no longer commanded the respectful attention once accorded them. In fact, sociology had perhaps arrived at the point where it was necessary to insist that studies of total value-systems, particularly those delivered by social anthropologists of psychoanalytic bent, be carried on with more stringency of method and technique; there was definite danger of reliance on casual impressions and the mistaking of the merely plausible for the demonstrably probable. The kind of analysis offered by Znaniecki, Opler, and George Homans, with its careful dissection of value-systems into "themes," "life-policies," "sentiments" and the like, could do much to counteract the suggestive but untrustworthy essays of Sorokin, Margaret Mead, Gregory Bateson and Benedict.

Closely related to the increased attention given to valuesystem analysis was the changed emphasis in the study of sociation. Where once it was thought sufficient merely to classify and rank in order of intensity the various associative and dissociative relations, it became increasingly evi-

dent that social interaction of every variety had so large a value-component that very little predictive utility could be attached to researches that ignored it or treated it as secondary. Studies of sociation could no longer run exclusively in the channels cut by Georg Simmel and his avowed or unavowed followers such as J. L. Moreno, W. L. Warner, E. D. Chapple and others focusing chiefly on the obvious externals of conduct. Pairs, "sets" and like groupings, for example, could not be adequately analyzed without direct heed to the value-systems in which they were incorporated. This was particularly obvious in the published work of the sociometrists clustering about Moreno, but fortunately practice seemed to be better than publication. If one were to take the articles appearing in Sociometry as they stood, instead of continually reading between the lines, one would have to conclude that the gyrations of so-called social atoms had as little reference to value-systems or fragments thereof as do the attractions or repulsions of uranium or lead. The elaborate pretense involved in using the terminology of physics and chemistry, while actually dealing with conduct not susceptible of reduction to physical and chemical interactions alone, robbed the researches of many students of sociation of their full effectiveness. Further, the perpetual intermingling of two differing analytic standpoints, viz., the situation as defined by the participant and the situation as defined by the observer, vitiated the great potential usefulness of many such studies of sociation. Among the most fruitful work in this field during the decade was that on the sociation of workers carried on at Harvard, but the criticisms just noted applied to these as well. When in F. A. Roethlisberger and W. J. Dickson's most elaborate study of pairs, triads and similar sociative groupings among employees there was no single word of reference to union or non-union ideologies, the disregard of value-system orientation was glaring indeed. If one were attempting to predict typical group responses in strike situations, of what utility would these studies of "workers' morale" actually be? Nevertheless, there could be no doubt that sociative analyses greatly advanced in relevance and precision during the ten years, and that Leopold von Wiese's conception of a sociology of economics was well on its way toward realization through the work of investigators who knew little if anything of Wiese and had only a few general ideas about Simmel. (This was not true, of course, of the sociometrists, for Moreno owed as heavy a debt to Simmel and Wiese as he did to Freud; the "psychodrama" as a process of "group therapy" is genuinely sociative in theory and practice.)

As a matter of fact, it seemed probable that the most definite theoretical influences on the Harvard analysts of workers' sociation derived from Durkheim and Pareto, particularly the latter. In general, it could be said that the stress on the non-rational aspects of conduct smacked of Pareto's "residues," and the ignoring of ideologies had more than a little flavour of "mere derivations." Pareto's vogue declined enormously during the decade, but some of its most doubtful benefits remained. Incidentally, it should be noted that Homans' magnificent treatise on the English villager likewise leaned heavily on Pareto, but that the use made of his ideas was soundly discriminating and genuinely advantageous. "Derivations" need not be treated as epiphenomenal unless the researcher is as fanatical a "positivist" as the inconsistent Pareto sometimes was.

A worthwhile phase of Pareto's analysis—by implication, at least—was the inseparability of social psychology and

sociology. The development of social structures was closely bound up, all through Pareto's work, with on-going changes in social processes and the concomitant shifts in dominant personality configurations. Talcott Parsons was perhaps too charitable an interpreter of the great Italian, but there could be little doubt that Parsons' zeal for the merging of sociology and social psychology stemmed as largely from Pareto as it did from Max Weber and Durkheim. A clearer case for the merger, however, was afforded by the writings of G. H. Mead and the neo-Freudians such as Horney, for here it was made abundantly clear that man becomes human, in the social-psychological sense, only in society. Only in and through interaction with his fellows who themselves as personalities have been woven from threads forming part of societal patterns does Homo sapiens take on the attributes of man defined as man in any society of which there is knowledge. Differently put: physiological psychology is a branch of biology; social psychology is inextricably linked with sociology; and socalled individual psychology incessantly fluctuates between these equally necessary poles. Still otherwise: man's experience as man is essentially dramatic; he learns to play roles in a cast of societal characters, takes parts in a dramatis personae, responds to his own actions as others respond to them and develops an array of mirrored selves which are eventually integrated in some socially acceptable

The contribution of the neo-Freudians to this essentially Meadian analysis was the reinterpretation of Freud's conceptions of id, ego and super-ego. The id became the more crudely biological phase of G. H. Mead's "I"-actions; the ego represented those social roles of the "me" with which the person could feel himself identified (plus those "I"actions of necessarily unique and less directly biological character consonant with such social roles) and the superego was taken to signify "me"-actions and assigned roles with which no genuine identification took place and which therefore remained somewhat external-even though this externality might become manifest only in schizoid states or extreme demoralization. Unfortunately, many neo-Freudians sometimes failed to analyze their vague referents. "society" and "culture," in terms of specific roles and their accompanying rights and duties; the result was the belligerent championing of the "environment" pole of the false "heredity versus environment" dilemma. Further, where Mead and his followers were wisely reluctant to catalogue "basic needs," the neo-Freudians ordinarily substituted an instinct for security for the orthodox Freudian instinct of sexuality; the derived arguments were just as circular in the one case as in the other. A sounder use of the neo-Freudian approach was evidenced by Abram Kardiner, who made a very sophisticated use of the conception of basic personality structure. If Kardiner's followers, notably Linton and Benedict, had been as circumspect as Kardiner himself, high hopes might have been entertained for the neo-Freudians. As it was, it seemed evident that they would have to become more thoroughly acquainted with the vast amount of work done on the socialization of the child and the adolescent by the ordinary "academic" psychologist, social psychologist and sociologist. At the same time, it must be granted that they rendered signal service by destroying orthodox Freudian dogmas; it was now possible to unite psychiatry of "functional" emphasis with other analytic social studies.

The importance of the value-system approach was also evident in the renewed attention to social stratification.

Fifteen or 20 years prior to the decade 1937-46, sociological interest in class struggles was well-marked; Albion W. Small's most famous course dealt with precisely this topic. The waning of ideological analysis during the '20s and the early '30s, perhaps because of behaviouristic prepossessions or intimidations, was counteracted from the later '30s onward by several factors. Among these was the assimilation of numerous emigré sociologists whose experiences with naziism and fascism had rendered them keenly aware of the crucial role of class mentalities. Moreover, the depression and its aftermath made even the most obtusc and optimistic of U.S. social scientists realize how sharply class lines had come to be defined in even so relatively open-class a country as the United States. The result was a flood of articles and books on stratification topics-a flood which showed little sign of abating even during World War II and which in the immediate postwar period had not noticeably receded. Along with careful analytic distinctions such as those made by Émile Benoît-Smullyan, for example, there were of course loose but popular presentations such as W. Lloyd Warner's nine-class scheme and the bandying about of the category of caste—a category, by the way, used in its limited and proper Hindu meaning by Oliver C. Cox. Further, the "Spissies" (members of the Society for the Psychological Study of Social Issues) generated a good deal more heat than light about U.S. class discrimination, but here and there valuable insights were achieved. As matters stood at the end of the decade, sociologists insufficiently aware of social stratification and its ideological accompaniments were hard to find.

Another trend of the decade, the inaptly christened "sociology of knowledge," was closely bound up, as ordinarily presented, with stratification ideologies and their analysis. Although he had many forerunners of much greater intrinsic importance than himself, Karl Mannheim was largely responsible for the burst of interest in the field because of the strong appeal his books made to those of left-wing political allegiance or imbued with the ideology of social planning. His severest critic, Alexander von Schelting, pointed out the untenability of any theory in which all knowledge is class-bound except the variety possessed by the promulgator of the theory-Mannheim made the "free-floating intelligentsia" the court of last resort. It must not be imagined, however, that "sociology of knowledge" was necessarily embroiled in epistemological quarrels, for it was quite possible to show the functional relations of idea-systems, on the one hand, and social processes and structures, on the other, without assuming one-way "causal" flow in either direction. Some of Mannheim's own substantive work was consequently above the epistemological battle, as was likewise that of Logan Wilson, R. H. Merton, Oscar Cargill, Margaret Smith Stahl and several other writers. Znaniecki, in his Social Role of the Man of Knowledge, pointed the way to effective research and showed how to avoid the many pitfalls awaiting the unwary.

Even greater "skill at running cannily among the spears" was needed in another field which greatly expanded during the ten years 1937–46—sociology of religion. Nevertheless, such skill was frequently in evidence; Joachim Wach, Paul Honigsheim, Milton Yinger and J. M. Mecklin, among others, provided excellent treatises and monographs. The basic reason for the success of these studies was close adherence to the practice of taking the religious belief in question as given and proceeding to the analysis of its functional interdependences with the social world per se. Questions of the validity or invalidity of the belief itself were not raised. Incidentally, it may be noted

that one of the most penetrating discussions of nazism to be offered in this period, Stuart P. Herman, Jr.'s It's Your Souls We Want, dealt with the economic and political realms involved from a standpoint akin to that of sociology of religion. A value-system for which men sacrificially live and gladly die is essentially religious even though no explicit supernaturalism is involved, and Herman made the most of this fact. Becker's German Youth: Bond or Free, a study of the perverting of the youth movement, was oriented in much the same direction.

War Work.-During World War II, and especially after the entry of the United States, much of the earlier work in social psychology and sociology having to do with minority groups, leadership, public opinion, population and related matters found a new focus in the "area" courses sponsored by the U.S. armed forces. Along with human geography, descriptive economics and a host of other social studies, the various aspects of the science of social relations were brought to bear on the problems of defeating the axis and on the eventual task of occupation. Here the emigré social scientists mentioned above performed yeoman service. They knew not only the component parts of the great social structures against which the Allies were contending, but in addition were able to chart the more subtle currents of axis mentality in ways which persons who had never participated in the value-systems concerned could never have envisaged. Working with them, naturally enough, were many social scientists from the Allied nations who possessed special competence in the "area" endeavour. As later events demonstrated, all too few of the men trained in the Foreign Area and Language Study Curriculum and Civil Affairs Training Program were actually placed in the military government niches for which they had been moulded, and those who were assigned to appropriate tasks were sometimes demobilized with undue haste in order to make room for ex-combat officers who did not relish the prospect of return to former peacetime rank. Military government posts looked attractive, and competitors were speedily ousted whenever possible. Yet it could be said that the effort that went into "area" training was not wasted, for the social scientists who carried out the job were brought to a vivid realization of the artificiality of most of the traditional boundary lines between many of their respective disciplines and of the consequent necessity for a regrouping of the social studies. True, there had been much effort long before the war to stimulate "interdepartmental projects" on the part of the foundations aiding research, but the projects were usually quite poorly conceived and the results frequently superficial. There was no merit in the crossing of departmental boundaries as such, but when there was a genuinely common problem or a close grouping of definitely related social sciences, the usual lines of academic jurisdiction could and should be ignored.

"Area" studies were not the only zone of operation for social scientists during the war, for they were on the staffs of a great number of the government bureaus and branches of the armed services. The information and education division of the war department used many, as did likewise the War Labor board, Board of Economic Warfare, the state department, United States Strategic Bombing survey, Office of Strategic Services, Office of War Information and scores of other agencies. After the V-days most of them returned to their peacetime posts, but U.N.R.R.A. and the United Nations absorbed a number, and the restaffing of the occupation groups with civilian personnel at the "expert" levels accounted for a few more.

A substantial part of the social-psychological and so-

ciological work done for the armed forces was of "poll" character. There were studies of food preferences among the troops, ratings of uniforms, conceptions of fairness in redeployment and demobilization, attitudes of civilians in liberated areas toward Allied forces and so on almost ad infinitum. By far the greater part of the work done along these lines was essentially trivial by any scientific standard, but it was often essential to the war effort and was conscientiously performed. Other studies of less need-of-themoment character were made, true enough, but except for the documentary value they had for peacetime research, their usefulness was exhausted when their immediate purpose was fulfilled. Documentary value, however, should not be underestimated, for although the ideal method for gathering data is to collect them with a highly specific research problem in view, the great mounds of material still held under security restrictions contained thousands upon thousands of recorded observations utilizable by all but the most hypercritical. World War II could be of some benefit to social scientists in general and to sociologists in particular if there was sufficient effort to extract that benefit.

American Sociological Society.-The American Sociological society underwent many changes, most important of which were: (1) the displacement of the American Journal of Sociology as the official journal in favour of the newlyfounded American Sociological Review; (2) the splitting off of the rural sociologists from the parent body; (3) the establishment of mail voting for officers of the society and the adoption of a new constitution of considerably more flexible character than the old regional sociological societies, some of them in almost open competition with the national body, continued to spring up and grow. The tendency toward a science of social relations co-ordinating social psychology, social psychiatry, social and cultural anthropology and sociology was made most clearly manifest by the establishment in 1946 of a department of social relations at Harvard, but Chicago had the substance of such co-ordination without the name, as did Wisconsin and several other universities. The breakdown of the last stronghold of resistance to sociology on the west coast occurred in 1946; Berkeley finally installed a department of sociology and social institutions.

Latin America.—The former supremacy of Argentina in Latin American sociology gave place to a triangular situation in which Brazil and Mexico figured as the other peers. Numerous books and periodicals were published during the decade, and university instruction grew. The activities of the Pan American Union and of the state department of the United States, as well as of the Carnegie and Rockefeller foundations, facilitated exchange of personnel, and prospects for further development were bright.

Great Britain.—In Britain the movement known as "Mass Observation" gave much promise of developing into a base outside the universities for a science of social relations, but in the later war years enthusiasm seemed to wane. Only the provincial universities and London had any persons on their staffs calling themselves sociologists; Oxford and Cambridge were still recalcitrant. Herbert Spencer rejected honorary degrees from both institutions. Morris Ginsberg continued to be the only professor holding an exclusively sociological chair, for Karl Mannheim's, likewise at the University of London, was in education. Nevertheless, Mannheim became editor of the International Library of Sociology and Social Reconstruction, established early in the war. Much of the interest in sociology

in Great Britain probably stemmed from two sources (1) the influx of refugee scholars who brought with them the continental familiarity with sociology, and (2) the drastic alterations in social structure resulting among other things, in the new Labour government and making most persons acutely aware of social relations they had formerly taken for granted

Continental Europe.—France underwent an almost complete elimination of sociology during the war, for it had come to be identified, in the popular mind, with the ideology of the Third Republic Its representatives either quietly submerged as did Marcel Mauss fled as did George Gurvitch or were killed as was Maurice Halbwachs After liberation, however, there was a genuine rebirth, a Centre of Sociological Studies was established in the buildings formerly occupied by the Institute of Intellectual Co operation of the League of Nations, and a new journal Cahiers Sociologiques, began publication under the editor ship of Gurvitch

The nazis hated no intellectual enterprise more deeply than the sociological, consequently the German Sociologi cal society was among the first of the learned societies to be liquidated Most sociologists lapsed into silence, fled or were imprisoned and exterminated, a few, however seized the opportunity to rise to power and one of them, Willy Gierlichs, eventually became Himmler's aide, committing suicide with him at Flensburg. As noted above, some of the sociologists fled, reached the United States and Britain and in many instances gave valuable assistance to govern ments and armed forces others who remained in Germany and survived took over important functions in the new regime-e g, Hanna Meuter became chief councillor for public welfare in the Aachen district, and Leopold von Wiese, although advanced in years became professor of sociology at Cologne and Bonn and president of the reconstituted German Sociological society. Unfortunately, the assassination of E Y Hartshorne, the military govern ment officer most conversant with sociology and eager to aid in its re-establishment, temporarily checked further advances

Another central European country, Czechoslovakia, ac tively resumed sociological teaching, research, publication and organization President Eduard Benes was a sociologist of repute, as was his predecessor Thomas Masaryk The Masaryk Sociological society, official organization of Czecho slovakian sociologists, renewed contact with the other so ciological societies throughout the world, and there seemed every reason to believe that the high level of productivity and quality of research formerly shown by its members would once more be achieved

Unfortunately very little was known about the state of sociology in Italy, the Balkans and the USSR The same was true of India, China and Japan; the accounts and bibliographies published in Barnes and Becker, Social Thought from Lore to Science, 2 vols, (1938) badly needed supplementing, but apparently more time had to elapse before accurate and up to date information would make that possible (See also PSYCHOLOGY)

Sodium Carbonate

The bulk of the sodium carbonate marketed continued to be made from salt, with consumption ranging from 3,037,000 short tons in 1937 to 4,693,000 tons in 1944, and declining to 4,513,000 tons in 1945. As compared with these totals, the output from natural sources was relatively small, increasing from 104,711 short tons in 1937 to 194,045 tons in 1945

There was a small but constant output in Canada, vary ing from 286 tons in 1937 to a high of 9,486 tons in 1943 and a low of 44 tons in 1944, swinging back to 239 tons in 1945.

(G A Ro)

Sodium Sulphate

Although the greater part of the sodium sulphate consumed continued to be manufactured from common salt, a considerable tonnage was produced direct from natural sources. In the United States output of natural sulphate increased from 80,053 short tons in 1937 to 178,196 tons in 1945.

In Canada, production increased from 79,804 short tons in 1937 to a peak of 131,258 tons in 1943, declining to 102,421 tons in 1944 and 86,643 tons in 1945 (G A Ro)

Soekarno

Soekarno (1901?-), Indonesian statesman, studied at the Bandoeng Technical institute where he received a degree in civil engineering Following a brief career in architecture, he went into politics after World War I He became one of the leading spirits in the leftist Perserikatan Naisonal Indonesia (National Indonesian party) Under the guidance of this party, many Indonesian nationalist groups were welded together and urged to accept the principles of nonco-operation with the Dutch, following the pattern laid down by Gandhi in India. Soekarno was arrested in 1934 and exiled to Flores island. After the Japanese conquest of Indonesia in 1942, Soekarno allegedly collaborated with the Japanese occupation authorities Two days after Emperor Hirohito's surrender broadcast, Japanese forces appointed Soekarno president of the newlycreated Indonesian republic He formed a cabinet and attempted negotiations with the Dutch, who refused to recognize his "native" regime

As British and Dutch troops were preparing to land in Java, Soekarno told foreign correspondents in Batavia that the Indonesians would fight any attempt to restore Netherlands sovereignty. The battles started with the landing of Dutch troops and on Oct. 12, 1945, Soekarno appealed to Pres. Truman to stop the Netherlands from using U.S. equipment to put down his independence movement.

On Nov. 13, Soekarno relinquished his ministerial duties to Sutan Sjahrir, who was named premier, but retained his duties and title as president. Soekarno, however. was believed to be the dominant figure in the government. He attended the signing, Nov. 15, 1946, of the Dutch-Indonesian draft plan under which the Dutch agreed to recognize the republic set up by him.

Softball

Its popularity enhanced by World War II and the need for employee recreation, softball made huge advances from 1937 to 1946. World championship amateur tournaments were held each year, starting at Soldier field, Chicago, and moving on to Detroit and then to Cleveland.

All sectors of the nation shared in the men's amateur championship, with Hammer field at Fresno, Calif., a wartime team, and the Fort Wayne, Ind., Zollners, scoring the only doubles. The women's tournament from 1937 to 1946 was chiefly the championship legacy of the far west and far south. Jax Maids of New Orleans, La., dominated play after 1942 with four out of five championships.

Softball reached its zenith in 1944, when two professional women's leagues were conducted in and around Chicago, centre of the sport. Salaries of from \$50 to \$150 a week were established, and leagues were conducted and promoted not unlike those of major league baseball.

In 1937, after a series of country-wide elimination tournaments, 84 teams gathered at Chicago for the world amateur final. The Briggs Manufacturing Co. of Detroit, Mich., won the men's title with a 1–0 victory over the B. & B. Clothes team of Sapulpa, Okla. The National Screw and Manufacturing Co. of Cleveland, O., won the women's title.

Pohler's Cafe of Cincinnati, O., won the men's amateur title in 1938 over a field of 56 teams, while J. J. Krieg's of Alameda, Calif., won the first of two successive women's tournaments.

In 1939, Carr's of Covington, Ky., outlasted Columbus, O., in the men's final, while the Alameda entry repeated as champion of the women's division.

Featuring a three-hit pitching performance by Harold Gears in the final of 1940, Kodak park of Rochester, N.Y., won the men's world tournament. The Arizona Ramblers, Phoenix, Ariz., won the women's championship.

An estimated 2,750,000 players took part in softball during 1941. Bendix Brakes of South Bend, Ind., won the men's world title in the annual tournament at Detroit, while the Higgins Midgets of Tulsa, Okla., dethroned the Phoenix Ramblers in the women's final.

In 1942, the Deep Rock Oilers of Tulsa, Okla., defeated the Briggs Bombers of Detroit, 2 to 0, in the men's world championship final. The Jax Maids of New Orleans, La., opened their reign of the women's tournament with a 4-1 final victory over Chicago.

While the Jax Maids were repeating as women's champion in 1943, Hammer field, an army air base near Fresno, Calif., won the first of its two successive championships in the men's division.

The west coast won both world titles in 1944, Hammer field repeating in the men's division and Lind-Pomeroy of Portland, Ore., capturing the women's title. Milwaukee,

Wis., won the All-America Girls' professional crown, while the Kandy Kids of Chicago topped the National Girls' league.

Winner of the world's pro basketball title, the Fort Wayne Zollners added the men's amateur softball title to their accomplishments in 1945. The Jax Maids won the women's title for the third time in four years, while Rockford, Ill., captured the All-America title and the Chicago Rock-Ola Music Maids topped the National league.

The year 1946 was a repeat year in both amateur divisions, Fort Wayne, Ind., winning the men's title and the Jax Maids of New Orleans winning their fourth women's title in five years. Both champions defeated teams from the Match Corp. of America, Chicago, in the final. Racine, Wis., won the All-America Girls' Professional Ball league title, while the Chicago Blue Birds won the National Girls' Baseball league crown. (M. P. W.)

Soil Erosion and Soil Conservation

Many large regions of the world have been permanently lost to agriculture through soil erosion. In old lands such as the near east, and in China, wherever cultivation was extended up slopes in farming through the centuries, soils have been washed off to bedrock, making it impossible to restore the productive capacities of the land. Some of the old world's natural grasslands have been turned into deserts, useless to mankind. In North Africa, central Australia, parts of North America and central Asia, deserts expanded as semi-arid grasslands were overgrazed year after year or plowed for cultivation. Even in Central and South America, large areas of both hill lands and valleys became so eroded that they would be worthless for generations. Only in certain specially favoured climates, such as that of Great Britain and western Europe, are cultivated and grazing lands relatively free from serious crosion.

According to the best estimates, only about 4,000,000,000 ac. of the world's total land area was immediately available for production of food and fibre crops during the decade 1937–46. From the standpoint of the needs of the more than 2,000,000,000 people inhabiting the earth, the most serious soil erosion was that evident on this 4,000,000,000 ac. on all continents. This included millions of fields and farms depended upon for food, livestock feed and fibre, which no longer were capable of producing good yields because they were eroded in varying degrees. Much of this land was rapidly deteriorating either because it had been larmed intensively without protective conservation farming measures or because it had been used to grow crops for which it was unsuited.

Lands vary widely from place to place and even on parts of the same field. Every variation in the combinations of soil, slope, climate and susceptibility to erosion means a variation in the use and treatment necessary to keep land permanently productive. Thus, to prevent erosion and depletion of soils, engineering measures must be used to supplement agronomic and fertility measures, according to the

needs of land, its adaptability for cropping and the economic limitations of land users. This was the basic principle underlying the new land technology developed in the United States and spread to many parts of the world by 1946.

U.S. Program.—Soil erosion had first been formally recognized as a menace to agriculture when in 1929 the United States congress passed legislation appropriating funds for the specific purpose of making investigations as to its causes and developing methods to control it. Research carried out at erosion experiment stations established under authority of this legislation (the Buchanan amendment to the Agricultural Appropriation bill for the fiscal year 1930) had formed the foundation for the national soil and water conservation program which grew and spread, in the following 15 years, to all states of the United States and to many other countries of the world.

Later historic steps in building for soil conservation in the United States had been: (1) Establishment of a technical agency (the soil erosion service) in 1933, with authority to work directly with farmers in demonstration areas in applying conservation practices to farmland, and to survey the total land of the country to determine the extent and severity of the erosion problem; and (2) adoption by congress of the Soil Conservation act, on April 27, 1935, as a law of the nation. The act set up the soil conservation service as a permanent bureau of the department of agriculture. Also in April 1935, the parliament of Canada passed the Prairie Rehabilitation act which, with subsequent amendments, authorized the dominion minister of agriculture to introduce soil and water conserving practices in those regions of the prairie provinces where soil drifting and other types of erosion were prevalent.

By the beginning of the decade 1937-46, soil and water conservation had been developed in the United States as the science and practice of using and conserving agricultural land and the water available for agricultural production. Thousands of experiments had been carried out to determine the causes and processes of accelerated erosion and to evolve measures that could be used to heal eroded soils and prevent further serious erosion on farm, range and forest lands. Between 1933 and 1937, complete soil and water conservation farming systems, based on scientific findings, had been applied to about 4,240,000 ac. in more than 500 demonstration and work areas in 42 states. Conservation methods were spreading to some farms outside the demonstration areas where they had proved effective both in controlling erosion and raising per-acre yields. Approximately 50,000 farmers and rangemen were co-operating with the demonstration program. At the same time, there was a growing consciousness of vast acreages of eroded lands far removed from the projects and of the urgent need for a new and more rapid approach to the problem of applying soil and water conservation on a national scale.

Events in 1937 supplied this need. In that year, farmers and rangers began organizing soil conservation districts under state laws. Legislative action in 18 states authorized formation of this new type of district on a community basis, with legal status, to ensure continuance and progress of soil conservation throughout the nation. The first district of this kind was chartered in Aug. 1937. It was the Brown Creek Soil Conservation district in North Carolina—the first unit of its kind in history.

Soil conservation districts were brought into existence by the initiative and vote of farmers and ranchers themselves

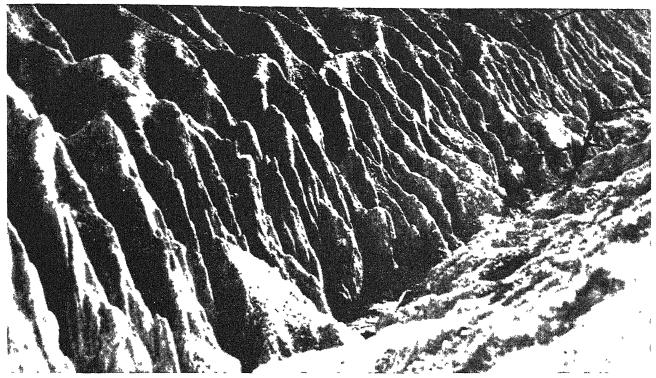

and operated by farmers through their elected officers. Districts were served, upon request, by planning technicians and other conservation specialists of the soil conservation service, living and working within the boundaries of the districts. Other federal, state or local sources of assistance also might be drawn upon by these districts. Every landowner acquired a voice in shaping the policies of the district. The aims of the district, its co-operating policies, the land-use changes and the soil and water conservation measures it decided to apply to the land, were set forth in a district program and work plan drawn up by the district supervisors with the help of landowners and technicians. The overall objective of such a district was to put all the land of all the farms under conservation land use and practices by working together on common problems and adopting conservation techniques on a community scale.

By Jan. 1, 1942, as the United States entered upon the full-scale warfare of World War II, 38 states had passed soil conservation districts laws, and farmers and ranchers had organized 642 districts including 377,000,000 ac. of land. Conservation farming on thousands of farms producing all kinds of crops had resulted in an average peracre yield increase of 20%, with additional savings in labour, fuel, time, money or machinery. These districts, and some 800 others formed during the war, proved an extremely important channel through which the national conservation program essential to protecting land and water resources under wartime pressure for maximum food and fibre production was carried out.

By the end of 1946, about 1,750 soil conservation districts and 21 grass conservation districts had been organized, including approximately 950,000,000 ac. and 4,160,000 farms. Several states were completely covered by soil conservation districts. All of the 48 states and Puerto Rico had enacted legislation authorizing local land owners and operators to organize for carrying out soil conservation work on the land and to obtain technical and other aid in doing it. Their common purpose was to restore eroded lands and to avoid additional devastation of still productive lands. It was to halt overcropping, plowing of grasslands, reckless timber cutting or other wasteful land use such as had caused heavy soil losses, dune formation and dust storms, gullying of large areas and serious depletion of grazing and crop lands. Such damage had been especially severe in some areas during and immediately after World War I.

Individual Planning.—The actual work of putting soil and water conservation on the land progressed with greatly increased momentum after the advent of soil conservation districts. During the ten years following establishment of the first such district in 1937, complete soil and water conservation plans were applied to some 90,000,000 ac. of farm and range land in soil conservation districts; plans were partially applied on another 10,000,000 ac.; and complete plans had been written by the soil conservation service, cooperating with farmers, for approximately 160,000,000 ac. At the same time, 130,000 more farmers and ranchers had made formal application for such plans for their land.

A complete soil conservation farm plan included specifications for use of each piece of land according to its natural properties, its capabilities for sustained production and its needs for erosion control. Such plans were based on land-capability surveys, made before farm planning began. The farmer and the farm-planning technician made the plans together directly on the land. The farmer designated the kind of farming he wished to do, the machinery available, the livestock he intended to carry and his economic outlook as related to conservation farming. The technician pointed out the practices needed to stop or prevent ero-

Formation of severely eroded nonarable soil in Mississippi

sion and make the land more productive. Land for growing row crops was selected, and rotations were worked out for all these fields. Permanent meadow or hay land, pasture and woodlots were selected from land not suitable for annual cultivation.

Erosion control practices required for each field were listed on the plan. Field boundaries might be changed so that crops could be fitted to land classes, or to permit contour cultivation, strip cropping or terracing. Green manure crops, cover crops or mulching with crop residues might suit parts of the land. If the farm was in a region of heavy rainfall, grassed waterways had to be planned; but in dry regions, a water-spreading system might he necessary for crop and pasture production. Still other practices might be considered before the plan was completed.

Once the details were agreed upon, they were recorded in a written plan, which included a farm map for the farmer to use as he installed the conservation practices with the assistance of the technicians. The chief advantage of this kind of farm planning was that each acre of land received careful consideration as to its needs for protective farming methods, developed and adapted to the land itself by scientific survey and experiment.

U.S. Soil Conservation Service.—The work of the soil conservation service, the scientific and technical federal agency responsible for soil and water conservation throughout the United States, was greatly broadened during the ten-year period 1937–46. Yearly, as public demand for farm and range conservation increased, the service's research, survey and operational activities were shaped to provide all needed information and assistance to the working units, the soil conservation districts. Experimentation was directed toward developing planting materials, equipment modifications and uses and facts about soil and water which would enable farmers to apply conservation while carrying out seasonal crop and livestock production, without extra cost or loss of crop production.

A survey charting the conservation needs of the total

land of the United States was made in 1942-43, and the results were made available to farmers, farm planners, industry, municipal and civic associations and other public groups and individuals. Based on classification of land according to physical characteristics and best productive use, the conservation needs survey provided the most complete analysis of agricultural land resources ever undertaken by any country. Basic information acquired by research and surveys was moved promptly to farm planning technicians working directly with farmers. The seven regional offices of the service and the field offices throughout the country provided the system for prompt, convenient channelling of improved methods directly to the land.

By 1943, nearly 60 different soil and water conservation practices had been tested and approved, redesigned or developed by the service for use on the land. Twenty-three of them were found to be effective in increasing crop production in from one to three years. Some of the principal practices incorporated in complete conservation farm plans in soil conservation districts during the ten-year period were as follows:

Contour cultivation 15,900,000 ac.
Cover crops 5,000,000 ac.
Crop residue management . 13,500,000 ac.
Strip cropping 5,000,000 ac.
Range properly stocked 40,800,000 ac.
Seeding range and pasture 9,800,000 ac.
Woodland improvement 7,500,000 ac.
Tree planting 503,000 ac.
Farm and ranch ponds 75,500
Terracing 871,000 mi.
Water diversions 100,600,000 linear ft.
Farm drainage 2,089,000 ac.
Land preparation for irrigation 607,000 ac.
Application of irrigation water 1,300,000 ac.

A survey of 9,348 farms under complete soil and water conservation farming plans, made in 1943, revealed that yields of all major crops had increased 35.7%.

Aside from assistance to soil conservation districts, the service participated in many large-scale conservation projects during the decade. These included studies of the silt-

ing of reservoirs as related to erosion on agricultural lands; development of emergency erosion-control methods applicable to the Everglades region of Florida; appraisal of water resources of the United States for use in determining the feasibility of proposed water projects; snow surveys; and flood control projects on small and large watersheds. During World War II, technicians of the service assisted the war and navy departments with flood control and erosion problems at harbours, cantonments, forts, arsenals and other locations.

During 1945, technicians of the soil conservation service spent 11,810,306 man-hours on soil and water conservation activities throughout the United States. Complete conservation farming systems were applied to 13,000,000 ac., and plans were drawn up for an additional 20,500,000 ac.

No small part of the service's essential functions during the ten-year period was training of personnel. Soil conservation explored the wide ramifications of land and water problems into many fields-physics, engineering, agronomy, ecology and biology, economics and sociology, climate, soils, forestry and others. It was early recognized that permanent conservation on land could be achieved only by co-ordinating the knowledge of many sciences and techniques toward a common objective. The training program of the service was especially designed to co-ordinate all knowledge relating to land, water and farming into a practical science aimed specifically at conserving soil while using it for production. Training schools for soil conservation technical personnel were held in six regions of the country; 1.263 employees went through these training centres in 1945. Several leading colleges and universities added soil conservation courses to their curricula during the war years.

Between 1937 and the start of World War II, ten countries other than the United States and Canada took steps to improve their agriculture through soil and water conservation. Experimental work was authorized and undertaken to adapt conservation practices to land types in four Australian provinces—Victoria, New South Wales, South Australia and the Bardekin river basin of Queensland; in New Zealand; the Punjab of India; Rhodesia, Kenya and the Union of South Africa on the African continent; and in Brazil, Argentina, Colombia and Venezuela in South America.

Africa.—In 1938, a soil conservation service was established as a branch of the department of agriculture of Kenya and was given wide powers for long-term planning as well as an immediate program to apply conservation practices to lands farmed largely by East African natives. At the same time, the British ministry of state for the colonies recommended that land conservation programs be incorporated in colonial governments and arranged for free grants of money to help in defraying the cost to natives of putting anti-erosion measures on the land. Uganda, Tanganyika, Nyasaland, Northern Rhodesia, Basutoland, Bechuanaland, Swaziland and Sierra Leone in Africa, with Palestine on the Asian continent and Jamaica in the West Indies, all had soil and water conservation programs in various stages of development by 1942. Although developments were impeded during the next five years by wartime shortages of conservation staffs, labour and equipment, remarkable progress was made in various African colonies, where erosion was so serious that yields of food crops had dwindled to almost nothing. Furthest advanced was the work in Kenya, where about 300,000 ac. had been treated by terracing, grassing of drainageways, contouring, gully

control dams and plantings by 1943.

In Swaziland and Basutoland, farmed mostly by Negroes, some highly successful conservation work was done with contour embankments in 1939–41. Corn yields were advanced from about 3 bu. to 12–15 bu. an acre by this practice.

During 1941, the legislative assembly of Rhodesia enacted the Natural Resources law empowering the Natural Resources board to direct use of land for pastures, cultivation methods, control of water and retirement of land from cultivation. Large-scale land use changes were made immediately, and soil conservation projects were begun on a watershed basis for protection of stream sources and valley lands subject to flooding or drying up because of upland erosion. In Uganda, also, considerable progress was made in the early 1940s. There, first attention was given to protection of grazing grounds by instituting rotational grazing on a wide scale and providing watering ponds for stock.

An area of 380 sq.mi. was reserved for permanent forest, and in cultivated areas the practice of contour strip cropping, whereby narrow grass strips were interposed between plowed strips, was enthusiastically adopted by native farmers.

As was the case everywhere, successful soil and water conservation throughout Africa presupposed active cooperation of the people in solving land problems. In some of Britain's African colonies, this co-operation had been obtained by 1945. In the territory of Tanganyika, for example, one of the features of the work was tribal organization to provide labour for putting conservation structures and methods on the land. In the Central province of Tanganyika, a 10-yr. program was organized in 1942 to control erosion completely on 5,000,000 ac. of pasture and 1,000,000 ac. of cultivated land, the work to be done through such tribal organization. With the consent of native tribes, large grazing areas were reserved for use in the dry season.

Likewise, hundreds of hilltops were closed to cultivation, gullying was controlled, and many acres of communal fuel plantations were planted.

During 1941, the senate and the house of assembly of the Union of South Africa adopted an act designed to amend the Union's laws on land use to make provision for soil and water conservation. Erosion experiments were car-

Gullies splitting grazed pasture lands in the mountain region of Bernalillo county, New Mexico

ried out, and very successful soil conservation demonstra tions were established in a few localities. Difficulty was encountered in spreading conservation methods to farm and grazing land, owing largely to disinterest on the part of land holders. In 1946, a national Soil Conservation act was passed, making soil conservation a national policy. In the meantime, the land of the country was surveyed in considerable detail, and vast areas were found to be eroding with great rapidity. Large wheat-growing tracts in Cape province already were ruined and abandoned; in northern Transvaal, between Pietersburg and the Drakensburg mountains, more than 100,000 ac. had lost practically all of the original topsoil. Where lands were still in cultivation, yields had dropped from 15 bu. of maize an acre to 3 bu. or nothing. Causes of this serious erosion were pointed out as burning of veld, manures and maize stalks; indiscriminate grazing of uplands and dry lands by goats, sheep, cattle, horses and donkeys; up-and-down slope plowing; and widespread cultivation, without rotations, of soildepleting crops. Most of South Africa's reservoirs were filling with sediment, while gullies and sheet erosion were reducing underground water supplies and permanency of streams and springs, especially throughout the Orange river basin. Average yields of tilled crops were estimated as having been reduced to 25% of the land's original capacity. In the Karroo, whole districts of originally good veld were so eroded that carrying capacity was but one-tenth of what it was before abusive land-use practices became common. It was noted that erosion had greatly altered the vegetation on hundreds of thousands of acres, while bankruptcy, abandonment of farms and even hunger were common in seriously eroded regions.

South and Central America.-During the first years of World War II, Mexico, Venezuela and Argentina had established special soil conservation agencies, while surveys to determine the condition of land, and educational programs to inform the people of the needs and advantages of conservation were in progress in most of the other Latin American countries, including Haiti and the Dominican Republic. Lack of trained soil conservation scientists and technicians was proving a handicap to these nations. The difficulty was overcome, however, when in 1942-43 arrangements were made to admit Latin American agricultural scientists to the United States for one year of training with the soil conservation service of that country. Twenty-five men, carefully chosen and sponsored by 13 Latin American governments, were trained the first year and returned to their home countries to act as leaders in various phases of land conservation.

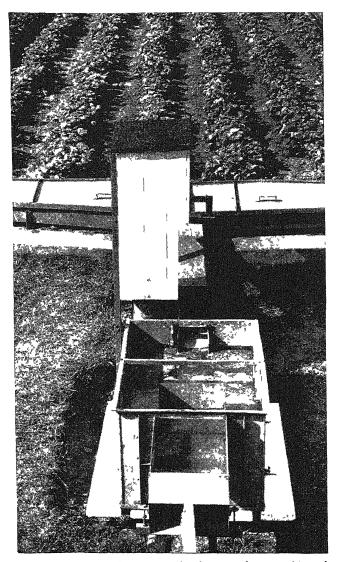

The training program for foreign conservationists proved valuable both to the United States and to other countries involved, and it was therefore expanded and opened to countries outside the western hemisphere in 1944. By the close of 1946, the governments of 23 countries had sent nearly 100 agricultural scientists to the United States for the year of study and training in all phases of developing. establishing and carrying out soil conservation as a permanent national program. In addition, an equal number of scientists and agricultural executives from more than 30 countries spent from three to eight months touring the United States to observe soil conservation districts and to study the voluntary co-operation through which conservation practices had been developed and applied to farm and range land. Some of the countries represented, aside from Latin American countries, were China, South Africa, Belgian Congo, Tanganyika, Australia, Palestine, Greece, India, Korea, France, Holland, Turkey, U.S.S.R., England and Scotland. New Zealand and the Netherlands Indies.

A World-wide Movement.—By the end of 1946, actual work of applying soil and water conservation to land had started in more than 30 countries of the world. Even before the end of World War II, a vigorous co-operative movement toward conservation agriculture in all its complexities was in evidence, between governments, educational and experimental institutions, industrial and business groups and land users in groups and as individuals. After the war ended, this movement quickly assumed world-wide proportions, as food shortages in many parts of all continents were traced to crop losses, extremely low yields from immense acreages of eroded or seriously depleted land or to loss of water through wasteful farming methods.

Five important food-producing countries-Mexico, Venezuela, New Zealand, Australia and the Union of South Africa-passed national soil conservation laws in 1945 and 1946. Twelve countries had established and organized federal soil conservation agencies similar to the soil conservation service of the United States, to lead, plan and apply soil conservation programs by co-operating with land users. They were Mexico, Guatemala, Venezuela, Peru, Chile, Argentina, Canada, Kenya, South Africa, Rhodesia, Australia and New Zealand. Conservation personnel, working through departments of agriculture of their respective countries, were applying conservation methods to land in Costa Rica, El Salvador, Colombia, Ecuador, Uruguay, four Brazilian states, Haiti, the Dominican Republic, six East and South African native states, Kansu province in China. the Punjab, Bombay province and the state of Hyderabad of India, in many parts of the U.S.S.R. and in Great Britain in some places where pressure of wartime production had caused erosion of hill lands or depletion of lowland crop lands.

Mexico's soil conservation program was well advanced by the end of 1946. Much of the groundwork for widespread conservation had been done, even before adoption of the federal law decreeing that soil and water conservation should be applied to all of the nation's lands early in 1946. Ten soil conservation districts, covering most of central Mexico, had been established by the government, and demonstrations established in 1942 and 1943 already were becoming effective in spreading conservation practices to farm lands. The practices used included contouring, modern terracing, gully control by structures and plantings, reforestation, range and pasture improvement, and grass planting in waterways where sloping lands had to be farmed to grow food crops. In the state of Tlaxcala, where erosion had been most serious, ravines were being controlled by means of dams, alignment structures, pilot canals and other engineering devices. Extensive crop rotation experiments were in progress, so that once the hazard from flooding through the ravines was reduced, farmers could use some of the valley lands to grow crops while they gradually restored soil fertility.

Paracutín, the world's newest volcano, became a part of one of Mexico's soil conservation districts. Scientists from many countries were participating in studies undertaken in an effort to find ways of reclaiming large forests and two irrigation districts invaded by lava or choked by ash from the volcano. Old volcanic soils are common in Mexico, but never before had students of erosion had the opportunity to start with a vast area of entirely new volcanic land in studying the erosion process. Experiments were underway, in 1945, to test various kinds of plants which might be used to restore a cover of vegetation to ash-encrusted areas in the vicinity of Paracutín.

Device for gauging the amount of soil erosion from a cultivated slope

Common Problems.-Through world-wide co-operation, many soil and water conservation practices already had been improved or adapted to areas with special problems. Of particular interest was the wide distribution and study of planting materials-grasses, trees, shrubs, leguminous and fodder crops-showing promise for erosion control and having economic values. Grasses native to China were being tested in the northwestern United States to determine their potentialities for range seeding. Kudzu, originally from China and Japan, which had been planted on more than 1,000,000 ac. of eroded land in the southeastern United States, was being tried out in Australia, Chile, Mexico, Venezuela and other Latin American countries, while at the same time a tropical variety of this remarkable erosion-control forage plant had been discovered and adapted in Puerto Rico on a wide scale. In Mexico, on eroded hill lands, extensive plantings of mixed fruit-bearing trees and shrubs from many countries were being made to control erosion on steep slopes devastated by cultivation, and to provide edible fruits for local consumption. Extremely important experiments were undertaken in Bombay province, India, to adapt leguminous crops to dry lands, for use in rotation with maize, grains and other badly needed food crops. Also noteworthy were the love-

grasses from South Africa which had been planted extensively in the southwestern part of the United States. These and other exotic drought-resistant grasses were hailed by ranchers and farmers as a solution to wind erosion problems in seriously dry areas.

As the decade ended, conservation scientists of many nations were pooling their knowledge and experience in the effort to improve and co-ordinate water conservation practices for use in agricultural regions subject to periodic droughts or general semi-arid conditions. An excellent system of terracing combined with water diversion channels had been designed in Bombay province, India, and applied to about 600,000 ac. of non-irrigable land by 1946. Yields of food crops were reported to have increased from 100 to 400% on some of this land by the water-saving methods and other soil conservation practices. Mulching with crop residues, in use on large areas in the United States, had been adopted by many Australian farmers as a means of storing moisture in the soil. Both small and large water storage projects, including ponds for livestock watering and other uses as well as water impounding for community irrigation, were an important feature of the soil and water conservation program of Canada's prairie provinces and the western United States. Approximately 19,000 small stock ponds, 4,200 dams for impounding water and 1,000 irrigation projects had been constructed in the Canadian provinces as of March 1945. In addition, tree plantings on a large scale, reseeding and regulation of grazing to preserve the range and contour strip cropping where lands were plowed were becoming common land-use practices in the Great Plains regions of both Canada and the United States. In Australia, Argentina, South Africa and parts of India, these methods were under study or already used as effective in helping to solve the problems of moisture deficiencies in regions subject to soil blowing and drifting when land had been denuded of its natural cover.

Steep slope erosion, often with gigantic gullies cutting into lowland, presented a stupendous conservation problem in some parts of the world. Surveys made by the soil conservation department of Mexico revealed that 30% of the steep lands and large acreages of valley lands of that country had been made totally unproductive by such erosion. In addition, about half the country remained semiarid. Other parts were subject to floods which destroyed entire crops and caused rapid and destructive erosion. An extremely mountainous topography further complicated planning by conservationists. Steep ranges make up 68% of the land area of Mexico, and much of the level land suitable for cultivation is in small strips between high, eroding mountains. Conservation specialists concluded that only complete revegetation of mountain regions would stop the spread of this vicious type of land destruction.

* * *

The Ten-Year period 1937–46 thus marked a definite trend among the people of the world toward agricultural development based on conservation of land and water resources. Hundreds of groups—nations, states or provinces, countries, associations both rural and urban and action groups even among so-called primitive peoples—were formulating long-term land conservation plans based on the premise that peace and prosperity would be impossible without adequate sustained yields of food and fibre crops from agricultural lands. At the United Nations Food and Agriculture conference, held May 18–June 3, 1943, in the United States, representatives of 44 nations agreed that if the food needs of all peoples were to be met in future times, the agricultural land of the planet should be ade-

quately protected from erosion and from other damage by effective methods for conserving and rebuilding the fertility of the soil.

Solomon Islands

The Solomon Islands figured prominently in Japan's drive to sever communications between the United States and Australia during the early part of World War II. Japanese task forces in March and April 1942, put several thousand troops ashore in the archipelago first on Bougain-ville, then on Guadalcanal and smaller intervening islands. Landings met with little resistance, as the Solomons had been lightly garrisoned, and the British withdrew all troops except a few officers and enlisted men who were left to live secretly among the natives and report by radio on Japanese troop and ship movements.

A series of air attacks against a large Japanese task force in the waters of the Solomons and the Coral sea in May 1942, turned back the task force into safer waters farther north, with heavy losses to the Japanese. This was the first serious reversal of the Japanese advance toward their apparent objective, Australia, and the "Battle of the Coral sea," as it was called, marked their farthest southward reach. This victory for the Allies, who had retreated from every stand, beginning with the Philippines and Malaya, in Dec. 1941, raised Allied morale and was one of the decisive battles of the war.

Japanese forces strengthened their grip on the Solomons, however, by moving in additional thousands of soldiers, especially concentrating them on Guadalcanal, where, at Henderson Field, they had an air strip in operation by August.

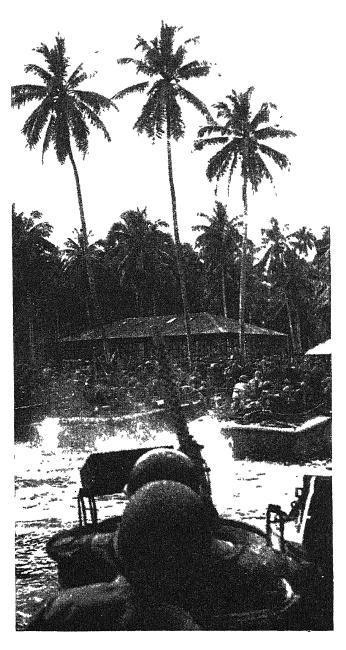

On Aug. 7, 1942, a strong force of U.S. marines accompanied by a naval task force which included Australian warships, struck the small islands of Tulagi and Gavutu in a surprise attack, carrier based planes bombed Henderson Field and marines of the 2nd division went ashore under protection of naval gunfire on Guadalcanal near the field.

This marked the beginning of one of the most remarkable campaigns of the war. In dense jungle, in swamps and mountains, often in torrential rains, modern weapons other than the trench mortar and automatic small arms were useless most of the time. Marines had to learn a type

of warfare utterly foreign to them, but for which Japanese troops had been well trained. Man stalked his enemy as a panther stalks its prey. Knile, bayonet and even fist fighting were not uncommon. Survival often depended on the animal-like art of concealment.

The malaria-carrying mosquito was a deadly enemy, taking a heavy toll of both Japanese and U.S. forces. The quinine substitute, atabrin, mosquito nets and the new miracle insecticide DDT were made available to U.S. soldiers in increasing quantities as the campaign progressed, reducing casualties and providing a standing operating procedure for future invasions of tropical areas. One of

Rendova Island in the New Georgia group, Solomon Islands, as it looked to U.S. soldiers landing in invasion barges early in the morning of June 30, 1943. The Japanese garrison was routed after a short but bitter struggle

the earliest experiments in use of blood plasma for wounded soldiers was conducted among U.S. casualties on Guadalcanal.

U.S. army units in November replaced battle-weary marines and supplies began to reach the island in increasing quantities. The seesaw, often bloody, battle, however, continued to be indecisive for some time, and the island was not secured till Feb. 9, 1943.

Several daring naval engagements took place in the waters of the Solomons as Japan and the Allies struggled to reinforce their troops. Japanese naval losses were estimated at 2 battleships, 12 cruisers, 26 destroyers and numerous smaller ships; U.S. naval losses, 2 carriers, 7 cruisers, 13 destroyers and several smaller ships.

In an island-hopping campaign, U.S. forces established beachheads at Munda in Feb. 1943, at Rendova and the Trobriand and Woodlark groups in July. In November they went ashore at Empress Augusta Bay and seized an airfield, establishing a firm and highly useful beachhead on Bougainville. Mopping up operations were not 'pressed, however, and some fighting broke out from time to time between the Allies and 22,000 Japanese troops who were completely cut off from supplies for the rest of the war.

The war interrupted a program of education and agricultural development for the Solomon Islanders which the British colonial administration had begun in the early part of the 1930s. The experiment was to give wider governmental powers to native authorities and to provide some elementary education and some education in health and sanitation. This work was resumed as rapidly as was practicable behind advancing Allied troops. Guadalcanal was officially turned back by military forces to the British colonial administration Nov. 13, 1942, though only a small part of the island had then been cleared of Japanese. Councils of elders were formed later in the villages, each with a headman to act as spokesmen for natives with the British resident commissioner. The council organized communal activities, such as precautions against epidemics, and was given the power of courts in cases of minor offenses.

Under the British Colonial Development and Welfare act, the resident commissioner and a staff of specialists helped the natives restore vegetable gardens and plantations ransacked by the military or destroyed by military operations.

The administration also experimented with new crops to supplement copra as a source of income for the natives.

Interruption of the colonial medical program by the war permitted fresh outbreaks of yaws, which disease had been brought partially under control. But doctors again were touring the islands before the end of hostilities, giving in jections and distributing drugs supplied by the United States.

Natives remained loyal to the Allies throughout the war, and not a single instance of betrayal of British scouts was recorded. The Japanese paid little attention to natives till Allied forces began to cut off Japanese supplies, after which time they pillaged native gardens and villages. Natives ambushed and annihilated the raiders on a number of occasions. (See also WORLD WAR II.)

The population of the Solomons in 1944 was estimated at 500 Europeans, 200 Chinese and 04,700 natives. Plans were made in 1946 to rebuild the protectorate capital at Tulagi, but this project, like others of the rehabilitation program, was hampered by shortage of shipping.

Somervell, Brehon Burke

Somervell (1892—), U.S. army officer, was born May 9, 1892, in Little Rock, Ark., and was graduated from the U.S. military academy at West Point in 1914. He served overseas during World War I, principally as personnel and supplies officer. During the peace years, he supervised civilian engineering and construction projects in the U.S. and Europe. Appointed assistant chief of staff in charge of the army supply division on Nov. 25, 1941, he became commander of the army supply services in March 1942. He thereupon became involved in a controversy with WPB officials, who charged that the army had sought control over all war production. Somervell's denial of these charges was qualified with his statement, Dec. 7, 1942, that "we do insist on running our part of it."

In late 1942, Somervell was appointed head of the Production Executive committee, created for the purpose of avoiding rows between the army and the WPB. Nominated for promotion to a full general, Mar. 13, 1945, Somervell made his final report as commanding general of the army service forces (A.S.F.) Oct. 27; in it, he declared that the A.S.F. achieved the "impossible" in handling its tasks. He retired Jan. 1, 1946, and on the following March 25, he was elected president of the Koppers co., in Pittsburgh.

Soong, T. V.

Soong (1894—), Chinese statesman, was born at Shanghai, the eldest son of Charles Jones Soong, wealthy Bible publisher, and a brother of Mme. Chiang Kai-shek. Educated in the United States, he attended Vanderbilt, Harvard and Columbia universities, where he specialized in economics, and later worked in New York banking houses. He returned to China in 1917 and became general

manager of the Canton Central bank in 1924. As finance minister, 1928–33, he introduced a budget system, central banking and unified currency. He founded and was first chairman of the Bank of China, 1936, later becoming president. On Dec. 23, 1941, Chiang appointed Soong foreign minister.

Soong was named acting premier (president) on Dec. 4. 1944, of the executive yuan, which gave him a position second in importance only to that of Chiang Kai-shek; on May 31, 1945, he succeeded Chiang, who resigned to devote his energies to other duties. Soong attended the San Francisco conference of the United Nations in April 1945 and later went to Moscow to confer with Joseph Stalin on proposals for the Russo-Chinese treaty and the soviet plans for attacking Japanese forces in Manchuria. Soong quit his post as foreign minister on July 30, 1945, because of the burden of his many concurrently-held government posts.

Discussing the civil war which followed World War II, Soong revealed on June 19, 1946, that the government was expending 80% of its revenue on a huge army totalling between 250 and 300 divisions, adding that the only way to avert disastrous inflation would be to achieve internal peace. On Aug. 31, 1946, Soong signed an agreement with the United States for purchase of U.S. wartime properties in China and the western Pacific valued at \$800,000,000.

South Africa, The Union of

A self-governing dominion of the British commonwealth of nations, South Africa consists of four provinces: Cape of Good Hope, Natal, the Transvaal and the Orange Free State. The former German colony of South-West Africa (area: 317,725 sq.mi.; pop., est. 1941: European 33,-600; Bantu and coloured 287,700) was administered under mandate as an integral part of the union, but the territory had not been incorporated as a province. Area 472,494 sq.mi. (incl. Walvis bay, 374 sq.mi.); pop.: (est. June 30, 1941) 10,521,700 (Europeans, 2,188,200; Bantu, 7,250,700; coloured, 844,400; Asiatic 238,400): (est. Aug. 1946) 11,258,-858 (Europeans, 2.335,460). Languages: English, Afrikaans. Religion: 95.5% of the European population is Christian (Dutch Reformed church, 55%, Anglican, 19%, Methodists 6%, Presbyterians 5%, Roman Catholics 5%, others 5.5%) and 4.5% Jews; 51.5% of the non-Europeans are Christian (one-fourth of them belong to the native separatist churches, one-eighth are Methodists, one-tenth Anglicans. etc.), c. 44% pagan (mainly Hottentots and Bushmen) and the remainder is divided between Hinduism, Mohammedanism and Buddhism. Chief towns (pop. 1936 census): Capetown (seat of legislature, 344,223); Pretoria (seat of government, 128,621); Johannesburg (519,384); Durban (259,606); Port Elizabeth (109,841). Governors general: Sir Patrick Duncan (Nov. 16, 1936-died July 17, 1943); Nicholaas Jacobus De Wet (July 1943-Dec. 31, 1945); Major Gideon Brand van Zyl (after Jan. 1, 1946). Prime minister: Gen. James Barry Munnik Hertzog (1924–Sept. 5, 1939); Gen. (after 1941 Field Marshal) Jan Christiaan Smuts (after Sept. 6, 1939).

Preludes to War.—The close of the Empire exhibition in Johannesburg in the middle of Jan. 1937 was like the end

of a chapter. The various dominions and colonies, which had sent their displays to be admired by the people of South Africa, packed up their pavilions, and the buildings erected with such care in the gardens of Milner park were demolished.

The influx of refugees from overseas had considerably diminished and was now only a trickle, but the activities of the nazis in South Africa grew steadily. Collections for winter help and other German causes, as well as visits of warships, all furnished pretexts for the German legation at Pretoria to indulge in fresh bursts of propaganda; and the utmost nazi efforts were made to obtain support from all anti-British elements. During this period an organization known as the Greyshirts made fresh efforts to win support in the backveld, but with very little success.

As though to stimulate discontent and to mark the mounting uncertainty in Europe the share market in South Africa collapsed. On April 8, 1937, the boom which had prevailed in South Africa since the relinquishment of the gold standard in 1933 was abruptly suspended. Already there had been signs of uncertainty on the stock exchanges both in Johannesburg and in London, yet the full meaning of the danger was understood by only a few. On "Black Friday" thousands of people (not only of the Witwatersiand gold fields but of all parts of South Africa) woke up to find themselves ruined. However, the gold industry remained unaffected so far as production was concerned. The gigantic workings underground, which now extended for 60 mi. with Johannesburg in the centre, continued operations at full pressure. There was no falling off in output and the stream of golden wealth continued to flow. The gold output in 1937 was 11,734,000 oz.; and it rose to 12,161,000 oz. in 1938; to 12,821,000 oz. in 1939; and to the record figure of 14,046,000 oz. in 1940. Under the stress of the later wartime labour shortages and the lack of new mining equipment there was a recession for a while; but the industry continued to function with impressive efficiency and even helped to supply the state with munitions.

Nor did "Black Friday" influence South Africa's remaining heavy industries. The new steel works at Pretoria, known as Iscor, were steadily developing. Since their opening in 1934, production had risen from 198,000 short tons yearly to more than 385,000 short tons, and before the end of the war it was more than 660,000 short tons. New blast furnaces and coke ovens were ordered, and extensions were under way at the iron mines of Thabazimbi, a mountain of ore.

Revelations of nazi activities in South Africa, published early in 1938, caused a disturbance and had echoes in parliament. At the same time, the then prime minister, Gen. J. B. M. Hertzog, remained firm in his belief that South Africa could remain at peace even though Europe should be plunged into war. Germany remained an excellent buyer of South African wool, wattle bark and other farm produce, while there seemed no limit to its appetite for manganese and other minerals used for armaments. The union's mines received big orders, and a barter agreement with Berlin was due for renewal, under which wool and other produce were supplied in return for German railway material and other finished articles.

Behind the scenes some objections were made to the closeness of relations with Germany, but on the surface it was a fairly united government (formed by a fusion of the former parties led by generals Hertzog and Smuts) which prepared for the general election of May 18, 1938. On the other hand the Nationalists, led by Dr. D. F. Malan, com-

plained about the excessive attachment of the government to the British commonwealth, while, at the other extreme the Dominion party, led by Col. C. F. Stallard, protested at what it regarded as the placating of anti-British feeling. Much was made of the action taken by Gen. Hertzog in objecting to the anti-German sentiments expressed by certain South African newspapers. There was a stinging exchange of views between him and several outspoken editors.

The election itself was fought with vigour by both sides. The Nationalists considerably damaged their case by publishing a poster purporting to show the results of the government's alleged "colour policy." Partly as a result of this and partly because of the country's economic progress, the government won a resounding victory and returned to power with a strong working majority, the figures being: United party (government) 111; Nationalists 27; Dominion party 8; Labour party 3; others 1.

Despite this there were certain indications that there might be political trouble before long. Events in Europe in 1938 caused deep anxiety in the union. The nightmare of war loomed near. In Pretoria preparations began at defense headquarters and elsewhere to meet the possibility.

Meanwhile an event of the greatest interest to all South Africans, irrespective of their politics, had fallen due. This was the celebration of the 100th anniversary of the Great Trek, on Dec. 16, 1938. The leaders of all political parties participated in the commemoration. The Voortrekker (pioneer) memorial was designed to crown a hill and thus to be visible for miles around. The commemorative ceremony, in conformity with Afrikaans tradition, was chiefly of a religious character. One of its accompaniments was the foundation of a movement of self-help known as Reddingsdaad (act of rescue) fathered by a highly respected Afrikaans pastor, the Rev. J. D. Kestell. Another movement originating at the same time claimed to be a nonpolitical attempt to unite all sections of the white populace as true South Africans. It called itself the Ossewabrandwag (ox-wagon sentries) or, briefly, the O.B.

As Europe staggered from crisis to crisis, the local nazis paraded and demonstrated not only in Windhoek, capital of the former German colony of South-West Africa, but also in the union, particularly in various German settlements diligently visited by various German consuls. The course of South African politics received the closest attention in Berlin. On Sept. 2, 1939, South Africa received notification from London that the British would fight. It was left to the South Africans, with their free dominion status, to decide for themselves what they would do. The British government awaited the union's answer.

Constitutional Struggle.-After Great Britain had declared war on Germany there followed one of the greatest and most important constitutional struggles on record in South Africa. Gen. Hertzog, as prime minister, decided that it was in the best interests of South Africa to remain neutral. He cited the discussions which had taken place at the time of Munich, interpreting them to mean that South Africa would in no circumstances agree to fight the Germans unless it were invaded. Gen. Smuts, as deputy prime minister, opposed this view. He pleaded that the union's name would be besmirched if it stood aside. The cabinet passed through an internal struggle. Then the matter came before parliament, and Gen. Hertzog's neutrality motion was rejected by 80 votes to 67. On Sept. 5, Gen. Hertzog tendered his resignation and the governor general (Sir Patrick Duncan) called on Gen. Smuts to form

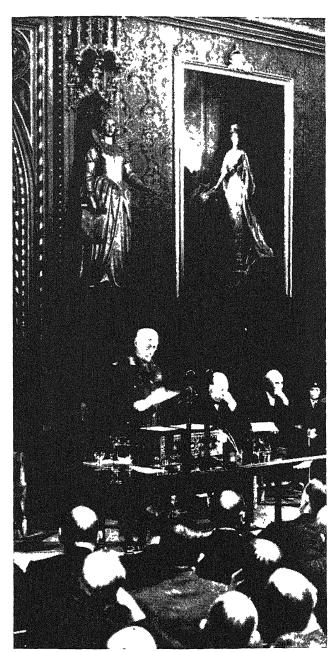

a new cabinet. On Sept. 6, the union was at war with Germany.

The government's war policy was announced by Gen. Smuts a few weeks later. He said that the question indirectly raised by the neutrality issue was whether South Africa was to stand with its trusted friends in the British commonwealth or go the other way and make friends with Germany.

Recruiting started, and the small active citizen force grew rapidly. The most mobile section of the union's defenses, the air force, started the patrol of coastal waters and before long had intercepted a number of axis vessels. Within a short time other mobilization signs became noticeable. The censorship of foreign correspondence began and grew steadily more effective as the war proceeded. Simultaneously a South African navy was formed. Simonstown, famous Africa station of the royal navy, became a most important base. South Africa realized how near the war was when at the end of 1939 the tanker "Africa Shell" was sunk off the coast of Mozambique by the "Graf von Spee."

The year 1940 began quietly. Members of the parliamentary opposition made jokes about the Allies' lack of initiative. After the fall of Holland (May 1940), a stream of propaganda was loosened on the union, through the German short-wave station at Zeesen. It was systematically ted with information gathered with extraordinary speed in South Africa, transmitted to neutral Lourenço Marques, distorted by the German propaganda offices and returned through the ether. Realizing the effectiveness of reaching the people on the farms and in the backveld generally, Berlin's ministry of propaganda engaged several Afrikaansspeaking men and women to address the Afrikanders in their own language. The broadcasts had a sufficient element of truth to make fantastic stories credible. The union government, having established a bureau of information, started energetic countermeasures; and a careful record was kept of everything transmitted by the axis. Gen. Smuts showed a patience with the disloyal element in the union which sometimes distressed certain of his supporters. He allowed speeches to be delivered which in other countries would have brought the speakers into prison for sedition or even high treason. Nor did he in any way interfere with freedom of speech among members of the parliamentary opposition. Soon, however, the wisdom of this policy became manifest. Violent differences developed between the antiwar factions. Gen. Hertzog fell out with his own former supporters and retired to his farm, where he died in Nov. 1942. To the end he protested against the increasing bitterness of their racialism.

The remaining opposition leaders likewise fell out. Oswald Pirow, minister of defense in the Hertzog cabinet, proclaimed himself a supporter of the totalitarian principle being applied to South Africa. He founded an organization called the "New Order," which aimed at abolishing party government as then known and the building up of a corporate state. His aims were not dissimilar to those proclaimed by the Ossewabrandwag, which abandoned any moderation it had shown at the outset and which ranged itself behind the former administrator of the Orange Free State, Dr. J. F. van Rensburg. The O.B. became organized on a military pattern. Van Rensburg was its commandant-general and there was a hierarchy of lesser officers all working for the overthrow of the administration. Parallel with these were the Greyshirts, whose uniform was copied from the nazis, but they were less numerous than the O.B. Malan's own followers dissociated themselves from these groups and from a number of smaller

Prime Minister Jan Christiaan Smuts of South Africa delivering an address to the British parliament during his visit to England in Oct. 1942. At his immediate left is Winston Churchill

movements such as the *Boerenasie* under the former Boer War leader and rebel, Gen. Manie Maritz. Gen. Smuts who, in addition to being premier, was also minister of defense, listened patiently to the clamour. All he did at the start was to cause all rifles to be bought up by the government for adequate compensation, to forbid the wearing of uniforms and the holding of parades without authority, and to intern a limited number of the worst hotheads. More drastic measures were taken with Germans. Internment camps were opened at Baviaanspoort and elsewhere for local nazis and others in South-West Africa. Several thousands spent the war behind barbed wire at Andalusia and elsewhere, while Italians were concentrated near the former Orange Free State diamond mines.

South Africa's War Effort.—Not far from Pretoria on the property of the Premier diamond mine, which had pro-

duced the famous Cullinan stone, another kind of camp came into being. It was known as Zonderwater and here, during 1940, South Africa's expeditionary force assembled. In cantonments which spread across the veld, thousands of men were trained. Gen. Smuts decided that the union would not have conscription. Recruiting posters and propaganda were substituted for compulsion. The call went out for women as well as for men, and the response was splendid. Although the European population was barely 2,250,000, some 200,000 joined the forces. In addition, 102,000 non-Europeans-natives, Cape Coloured, Indians and Malays-joined up. For reasons of policy, it was decided not to arm the non-European troops but, instead, they were trained in non-combatant duties, particularly as drivers and medical orderlies. One out of every three white men in the union between 20 and 60 years of age came forward voluntarily for full time duty-190,000 out of 570,000. Simultaneously, the union government decided to expand the country's industry to meet war needs. Iscor works at Pretoria were turned over to the manufacture of steel for munitions. Work began on the design and manufacture of light artillery shells, parts for tanks and for thousands of other items necessary for war. Dr. H. J. van Der Bijl, chairman of Iscor, took over the post of first director-general of war supplies and then director of supplies.

New war factories grew up in lonely places and near busy cities. Not only was the union to a large degree meeting its own needs for civilian and military goods, but it was exporting on a large scale to most parts of southern Africa and even overseas. It was doing ship repairs on a large scale. As the normal sources of imports from overseas were cut off, South Africa turned to its own plants or sought new suppliers. South America, particularly the Argentine and Brazil, became vitally important as furnishers of textiles.

South Africa's first armies reached East Africa in 1940 and went into training at Gilgil and elsewhere in the hills. Before 1940 ended the first important action had been fought at Elwak on the borders of Kenya and Italian territory. It was a small affair, yet it would always be remembered in South African history, for it marked the start of the downfall of fascism on the African continent. Into Kismayu, through the sands of Somaliland, into the hills of Ethiopia and on to its capital Addis Ababa, troops of the union fought their way—particularly the steel commandos as they were called. The skill of the Afrikanders in their armoured cars recalled that of the horse commandos of the Boer war.

Yet another role came to South Africa during the war. With Rhodesia it now provided training grounds and training centres for thousands of British airmen. Schools under the Empire scheme were established, and soon they became known wherever royal air force men flew—Lyttelton, Oudtshoorn, Queenstown, Vereeniging, Potchefstrom and many more. From there fliers returned to participate in Britain's defense against the luftwaffe and later in bombing Italy and Germany into submission. With their R.A.F. comrades, the South African air force trained and fought—first in Ethiopia, then in North Africa and beyond.

By the middle of 1941 the Ethiopian campaign (save for the last stronghold at Gondar) was over. Tragic moments followed in the western desert—the bloody field of Sidi Rezegh in November and December 1941 and then, after half a year of seesaw warfare, to and fro along the north African shore, the calamity of the second siege of

Happy to be home, troops of South Africa's first division paraded through Capetown in 1943. These troops helped break German defenses at El Alamein in Oct. 1942

Tobruk. After the valorous earlier stand, it came to pass that nearly 10,000 of the best troops from the union were captured by the Germans. Yet under the inspiration of Gen. Dan Pienaar, the finest soldier South Africa produced in World War II (destined to lose his life in an air crash in the very hour of victory), the South Africans continued to fight from El Alamein to Tripoli and Algiers.

As 1942 advanced the number of ships sunk around the union became appalling. Blackouts on the coast were enforced rigidly and even inland centres such as Johannesburg organized civilian protective services to handle air raid precautions. Japan's men-of-war and secret agents were coming ever nearer in the Indian ocean. Vichy was now almost entirely pro-German. Madagascar, that huge French island colony, was only a few hours flying distance from Durban on the mainland of the union. Already the union's naval and air forces had prevented a convoy of French ships loaded with rubber and other products from reaching German-held Europe. That was in Nov. 1941. Now more drastic measures were demanded. Secretly the union helped in preparing for the occupation of Madagascar. Not only did South Africa furnish war matériel, but men, ships and aircraft were all there in May 1942, when the Allied forces (themselves under South African-born Rear-Admiral Neville Syfret) descended upon Diégo Suarez and other Madagascar ports, thereby ending the threat of a Japanese landing. In the middle east, meanwhile, teams of South African engineers and miners from the gold fields built railways and drove tunnels designed to link up the Allies more effectively with Turkey and Russia. South Africans were in Syria and in Persia where they did brilliant work.

In 1943 the life of the pre-war parliament ended. Without the slightest hesitation Gen. Smuts decided to let a general election take place as usual. Despite the bitterness shown by the opposition (one of their posters showed the prime minister as a devil with horns and a tail) the result was another resounding victory. The government side, which since the beginning of the war had included the Labour and the Dominion parties, obtained 107 seats against 43 for Dr. Malan's Nationalists.

There arose the question of whether the original "anywhere in Africa" oath taken by all men willing to serve "up north," and symbolized by the orange flash on their shoulder straps, should be extended to cover service in the new theatre of war-Europe. Legislation was introduced and, after a full debate, passed by parliament. The troops were given the choice of serving in Africa or overseas. With negligible exceptions, the mass of the army, navy and air force agreed to carry on overseas. The South African air force and the 6th South African armoured division moved forward with the Allied forces in Italy. When Mussolini's Italy collapsed in the middle of 1943, thousands of South Africans were set free from prison camps only to be recaptured by the Germans. Hundreds escaped into Switzerland and hundreds more received shelter from their former Italian enemies. In the union itself, near Pretoria, sat 80,000 Italian prisoners wondering about their fate.

Now the union government saw peace ahead and new problems approaching. It set up a directorate of demobilization to prepare for the return of the men. Elaborate facilities for technical training, hitherto earmarked for war, were to serve the needs of the homecoming troops. Gen. George Brink was placed in charge. The war machine, however, ran on at high pressure. Munition and war factories, many of them located in places like Kim-

berley, which had little previous experience of manufacturing industry, employed more than 60,000 men and women. They turned out hundreds of millions of rounds of ammunition, thousands of pieces of light ordnance, vast tonnages of armour plate, tens of thousands of vehicles and millions of pairs of boots. As far afield as Burma, products of the union's war industry were used. Lendlease material from the United States came in a steady stream to supplement local production.

After V-J day, South African war prisoners came back from Europe, soldiers were demobilized and thousands of girls returned from the army and navy to the offices and kitchens. Various home detense units, such as the national volunteer brigade and the mines engineering brigade, were allowed to stand down. (Civilian guards for the time being continued to supplement the efforts of the police.) Gen. Smuts travelled backward and forward between South Africa and Europe, now meeting parliament, now in conference with statesmen in Downing street and elsewhere, to help in planning peace.

Postwar Problems.—Endless problems awaited solution -in many of which South Africa was vitally concerned. There was the future of Italian East Africa, the reemployment of soldiers, the shortage of housing, the 1epatriation of local nazis, and the weeding out of undesir-

ables in South-West Africa. There was a mass of racial problems-particularly those concerning natives and Indians. The position of the Indians in Natal, especially, demanded urgent attention. Tens of millions of pounds had to be repaid to the U.S. under lend-lease, while the country itself had a war debt of around £400,000,000.

The government did not hesitate to tackle these problems. It set up organizations to deal with housing which had fallen far into arrear. It started a huge program of soil reclamation and irrigation, followed in Aug. 1946 by Gen. Smuts's announcement that immigration would be welcomed. World War II had not proved solely a matter of losses. Despite thousands of casualties and a legacy of hate, the world had learned to regard South Africa as a nation. Its prime minister had played a vital part in writing the charter of the United Nations at San Francisco in 1945. The opposition had agreed to support that body as it also accepted participation in the international bank planned at Bretton Woods. (E. Ros.)

South Australia

South Australia was proclaimed a state of the commonwealth of Australia on Dec. 28, 1836. A1ea: 380,071 sq.mi.; pop.: (1937 est.) 591,201; (1946 census) 635,400. Chief towns (pop. 1945 est.): Adelaide (cap., 370.000), Port Pirie (12.-000), Whyalla (8,000). Governors: Major Gen. Sir Winston Dugan (March 26, 1934-39); Sir Malcolm Buclay-Harvey (March 2, 1939-44); Lt. Gen. Sir Charles Willougby Moke Norris (after Dec. 19, 1944). Prime ministers: Sir Richard Butler (April 18, 1933-Nov. 5, 1938); Thomas Playford (after Nov. 5, 1938).

In ten years, the economic structure of South Australia changed so drastically that the state no longer could be regarded solely as agricultural and pastoral, depending on primary industries. The introduction of vast new undertakings (hastened during World War II) and the expansion of existing secondary industries, some centred in country areas, made it semi-industrial and created a more balanced economy. Wheat farmers abandoned doubtful holdings in areas where regular rainfall was not assured (more than 80% of the state has an annual rainfall of less than 10 in.).

More than 80 new industries, including a number from Great Britain, started in the first eight months of 1946 alone.

Foremost in the industrial expansion was the further exploitation of the great iron ore deposits at Iron Knob, 33 mi. inland from the port of Whyalla on the western side of Spencer's gulf. Iron Knob's expansion automatically led to the growth of Whyalla, where heavy industries were established, including a blast furnace and shipbuilding yards.

Jan. 4, 1937, marked the beginning by a liberal government of an experiment in socialist planning that attracted worldwide interest. A state housing trust was created primarily to build modern, permanent homes for renting to workers of the lower income group. It was a success. More than 3,000 of these homes were erected, and more were being built. The trust extended its activities later to build large modern homes for sale on easy terms, principally to returned servicemen. Also in 1937 a reservoir at Mt. Bold, with a capacity of 6,662,400,000 gal. (prac-

tically doubling the water storage for the metropolitan area) was completed. It was officially opened in 1938. The size of the state parliament was reduced from 46 members, representing 19 districts to 39 members from single electorates.

State elections were held in 1938, and a Liberal and Country league administration was returned under the leadership of Thomas Playford, who proved a leader of outstanding driving force and administrative ability and a man with marked foresight. Returned again in 1941 and 1944, with a reduced majority, Playford established a record for continuous office.

With the beginning of World War II, the state was mobilized promptly on a war footing. In the years 1940 and 1941, army and air force training camps were established, thousands of men and women entered the services, and civil defense sections were organized. There was great industrial expansion, the extensive motor-bodybuilding plants were turned over to war production, railway workshops produced armaments and aeroplane components, and other industries changed to war output. Three large munition factories were built. One became the largest in the southern hemisphere, covering an area of more than 16 sq.mi. As part of the war effort at home, the government prohibited horse racing and betting within the state. Linked with the establishment of heavy industries, the most dramatic development in the industrial history of the state came with the reawakening of interest in the old Leigh Creek coalfield, 380 mi. north of Adelaide. After a detailed survey in 1940, revealing deposits of more than 400,000,000 short tons, drillings were made in 1941 and later, production was started by open cut methods.

South Australia: Statistical Data

Installation of grading and steam drying plants was undertaken to raise the calorific value of the coal. Production from the field rose rapidly. But in 1945–46, when supplies of high-grade coal from New South Wales coalfields broke down, production from Leigh Creek was not sufficient (and in many industries boilers had not been converted for the lower grade state-produced coal) to avoid serious stoppages in industry and transport.

Late 1943 and early 1944 saw the completion and opening of the Morgan-Whyalla pipeline, an ambitious project taking water from the River Murray 223 mi. overland to Whyalla. Previously, Whyalla had relied on water carried by ship from New South Wales and on surface supplies. The new project cost nearly £A3,450,000 and was officially opened on March 31, 1944.

On April 29, 1944, the state elections were made compulsory for the first time. Playford's government was returned with a majority of one. The standing of the parties was: Liberal and Country league, 20; Labour, 16; Independents, 3.

Projects were started in 1945 for the settlement of returned servicemen on agricultural and pastoral lands and on blocks in irrigation settlements along the River Murray. The government scheme envisaged the preparation of holdings to a state of productivity before settling the soldier. Development of state timber forests in the southeast was pushed ahead, and in 1946 preliminary arrangements were completed for the building of a new deep sea port at Robe to serve the rapidly expanding district.

An important step in 1946 was the acquisition by the state government of the Adelaide Electric Supply company, which for many years supplied the power for the metropolitan area and part of the country. A state board was appointed to administer electricity supplies in the future and to arrange for extension of supplies to more country districts.

Late in 1946, South Australia jumped into world prominence when it was announced that the British and Australian governments had combined to establish an experimental range for guided projectiles at Mt. Elba. Initial development was to be up to 300 mi. missiles but it was planned to have a 3,000 mi. range later directed northwest toward the Christmas Islands in the Indian ocean. Projectiles were to be controlled by radar from point of fire to destination. The total cost of the project was estimated at \$18,000,000 and there would be an annual expenditure for maintenance and equipment of about \$19,000,000. South Australia was considered to have the only suitable area in the British empire for this type of experimental work. (M. W. Js.)

BIBLIOGRAPHY.—Annual Pocket Year Book and Annual Statistical Register (Adelaide).

South Carolina

A south Atlantic state of the United States, South Carolina was eighth of the original 13 to ratify the constitution, in 1788; popularly known as the "Palmetto state." Area, 31,055 sq.mi., including 461 sq.mi. of inland water. Population (1940) 1,899,804, including 1,084,308 white; 814,164 Negro; 1,332 others; 75% rural; 24.5% urban; 0.3% foreign-born. Capital, Columbia (62,396). Other cities: Charleston (71,275); Greenville (34,734); Spartanburg (32,249). The bureau of census estimated the population of the state, July 1, 1944, at 1,923,354.

Extensive strikes in 1935-36 caused a conservative reaction. Support of Franklin Delano Roosevelt's policies continued to be overwhelming, although many senators and the state bar association condemned the proposed

change in the supreme court. Gov. Olin D. Johnston's hostility to the highway department continued in 1937, characterized by his charges of political domination by the department. The governor's demand for removal of Chief Highway Commissioner Ben M. Sawyer was answered by the new commission's electing Sawyer for his fourth consecutive four-year term. While Gov. Johnston roused much feeling against the commission (having in 1935 seized their offices by military force, until restrained by the supreme court), conservatives highly valued the commission's services.

Labour troubles diminished during 1938. President Roosevelt's attempt to defeat Senator E. D. Smith with Governor O. D. Johnston resulted in Smith's overwhelming re-election for a sixth term in 1938. As a result, fewer than 500 Republicans voted in the 1938 general election. The senatorial race was not inspiring, Smith strongly playing up the race issue, and Governor Johnston the friendship of the President. John L. Lewis's opposition doubtless helped more than it hurt Smith. The governor's race in 1938 presented several unusually good candidates, of whom Mayor Burnet R. Maybank of Charleston was chosen over Wyndham M. Manning (son of Governor R. I. Manning of 1915-19) by a majority less than his large vote in Charleston. A house vote of 50 to 44 for repealing the constitutional prohibition of divorce fell below the required two-thirds for submitting amendments to the people. A senate vote for refusing marriage licences to "socially diseased" persons, and requiring a five-day interval between licence and marriage was not concurred in by the house. The general property tax for state purposes was eliminated by veto. A teachers' pension bill failed, and a popular referendum overwhelmingly defeated a constitutional amendment pensioning judges at 70.

Late in 1939, bands labelled K.K.K. in several upcountry counties occasionally committed violence against racial or political opponents or supposedly immoral persons. Vigorous investigation and early arrests resulted. The 1939 legislative session (Jan. 9 to July 1) was the longest on record for the state, because of squabbles over revenue measures, and the continued growth of local legislation of no more general concern than a town ordinance.

Governor Maybank continued, in 1940, to urge state police to supplement antiquated local law enforcement, diversion of part of an abundant road support from gasoline tax to general purposes in order to avoid increasing general taxes and a constitutional convention to modernize the constitution especially as to taxation. A few K.K.K. parades and whippings brought several prosecutions. The state voted 95% Democratic in the 1940 national election, giving Roosevelt 95,470 votes and Wendell Willkie 4,360. The people voted for biennial (instead of annual) legislative sessions and for prohibition. Large army training camps were located at Columbia and Spartanburg. A coastal hurricane of Aug. 11 killed 35 or 40 persons and wrecked about \$3,000,000 worth of property.

Governor Maybank, though twice defeated by the courts, continued in 1941 to seek a means of diverting part of the gasoline tax from roads to general purposes. A probation and parole board was created, but could not be given control of pardons, as the governor desired, without constitutional change. Horse-race betting was legalized in several low-country "resort counties." Biennial sessions, twice popularly voted, again stranded on details. Prohibition, heavily voted, was enacted and provided that new revenues be found to replace the \$3,000,000 from state

liquor taxes by July 1, 1942. Legislation for regulating loan sharks again failed. Several Ku Klux Klansmen were sentenced to prison for masked parades or whippings. Governor Maybank was elected U.S. senator to succeed James F. Byrnes, who was appointed to the U.S. supreme court. Maybank was succeeded by J. E. Harley, lieutenant governor, Nov. 4, 1941.

Governor Harley died Feb. 27, 1942; he was succeeded for the rest of 1942 by senate president R. M. Jefferies. The 1941 law enacting prohibition if the 1942 legislature provided taxes fully replacing liquor revenues lapsed because of no action. Other defiances of heavy referendums for prohibition were manifested by the legislature and by the state Democratic convention's refusal to endorse them, though Governor-elect Olin D. Johnston (elected Nov. 3, 1942) strongly supported prohibition. Extension of the parole system, slum clearance, low-cost housing (especially for war workers) and, in two counties, old-age teacher pensions were enacted. Farmers of the state voted 91% for continued cotton acreage control. The \$57,000,000 federally financed Santee-Cooper navigation and power plant began operation Jan. 31, 1942, and by December was producing 2,000,000 kw.hr. a day, exceeding its planned annual 700,000,000 kw.hr.

The legislature in 1943 extended state support for schools from eight months to nine; raised teachers' salaries (which any district might supplement) 15%; assumed practically the entire expense for bus transportation of pupils; appropriated \$186,000 for school lunches; raised state employees' pay 10%; voted \$50,000 for postwar planning; appropriated \$6,800,000 to reduce state debt; eliminated primary election laws for fear of federal action on the rule excluding Negroes from the Democratic party, thus leaving primary regulations to private party action; passed a law requiring physically fit males between the ages of 16 and 60 to work or fight; discontinued the low state tax on general property. In addition, the governor vetoed a marriage protection act and the legislature defeated an effort to permit the \$57,000,000 Santee-Cooper hydro-electric authority to buy two large companies for \$40,000,000, fearing politico-economic monopoly power. A suit to compel equal pay for white and Negro teachers brought no results.

The total state appropriations in 1943 were \$18,161,555, largest in the state's history. Highway gasoline revenues, however, fell to about half. Farm wages were the highest in 20 years. The only one of the penal officials charged with corruption so far tried was acquitted, though bad conditions were undoubted. A sheriff was sent to jail for 60 days for depriving a prisoner of federal constitutional rights. The 250 Catawba Indians were by agreement with the U.S. provided at joint expense with more lands, schools and direct support, admitted to citizenship and transferred to federal supervision. The state supreme

court ruled that Methodists refusing membership in the reunited church might use the name Methodist Church South, but not any of its property.

Olin D. Johnston, serving his second, though not consecutive, term as governor, was elected in Nov. 1944, to the U.S. senate over the incumbent Ellison

D. Smith, who died at the age of 80 on Nov. 17, 1944. Following the legislature's repeal of all primary election laws, a resolution was passed asserting devotion to white supremacy. The rejection of Negro applicants for membership in the Democratic party led to the formation of the Progressive Democrats by pro-Roosevelt Negroes. The regular Democratic electors for president received 90,601 votes (perhaps 3,500 of which were from the Negro Progressive Democrats); Southern Democratic electors (white anti-New Dealers favouring Harry F. Byrd for president) 7,799; Republican electors 4,610 (perhaps 1,300 being from bolting white Democrats); Prohibitionist electors 365. A proposal by the council for Columbia to buy for \$39,500,000 gas and electric utilities serving that and some other localities was dropped because of public opposition.

Ransome J. Williams became governor on Olin D. Johnston's resignation Jan. 2, 1945, to become senator. Gov. Williams urged that criminal laws be better enforced. The sheriff's association agreed and severely criticized liberal pardons. Legislative efforts were ineffectively made for constitutional revision of the pardoning power. A resolution for referring to popular vote the removal of the constitutional prohibition of divorce failed, lacking the necessary two-thirds. An extensive alumina plant began operations in July; large hydro-electric expansion occurred; and a \$12,000,000 box factory and a \$10,000,000 Celanese plant were announced. A few protracted strikes in textile occurred. The National Council of Negro Democrats, meeting in Columbia and sponsored by Carolina Negro Democrats with representatives from several states, urged a systematic campaign for making Negroes politically conscious as being necessary for securing recognition in the south. From Nov. 1, 1940, through June 30, 1945, accession to U.S. army personnel from the state totalled 119,000 men and 1,886 women. Total accessions to the navy were not available; but those in service at the close of World War II totalled 45,827 men and 1,065

South Dakota

A north central state of the United States, South Dakota was admitted as the 40th state on Nov. 2, 1889, popularly known as the "Coyote state." Area, 77,047 sq. mi., including 511 sq.mi. of water. Population (1940) 642,961, with 158,087 listed as urban and 484,874 as rural; Indian population 23,347. Capital, Pierre (4,322). Principal cities: Sioux Falls (40,832); Aberdeen (17,015); Rapid City (13,844); Huron (10,843); and Mitchell (10,633). The federal census bureau estimated the population at 558,629 on July 1, 1944.

South Dakota, normally Republican, had become wholly Democratic in 1934. At the elections of 1936, Republicans placed in office the governor, lieutenant governor, one congressman and captured both houses of the state legislature. The leading state officials at the beginning of the decade 1937-46 were: Leslie Jensen, governor; Goldie Wells, secretary of state; Donald McMurchie, lieutenant governor; Raymond A. Kelly, auditor; W. H. Hinselman, treasurer; Clair Roddewig, attorney general. The chief legislative act of 1937 was a system of old-age pensions.

In 1938 the state re-established its normal politics with a complete Republican roster of state officers: Harlan John Bushfield, governor; Donald McMurchie, lieutenant governor; Olive Ringsrud, secretary of state; W. W. Warner, auditor; Will G. Douglas, treasurer; Leo Temmey, attorney general. A constitutional amendment, enlarging the legislature, was defeated. (D. Ro.; X.)

The state legislature met in 26th regular session in 1939; measures enacted included a capital punishment law and a blood test-before-marriage bill. Three amendments to the state constitution were proposed, to be voted on at the Nov. 1940 election. In all, 300 laws were passed. Governor Bushfield, 16th governor, was inaugurated on Jan. 3, 1939.

In the general election of Nov. 5, 1940, the Republicans retained complete control of the state government and the

state's two congressional seats. In the presidential vote, Wendell Willkie carried the state 177,065 to 131,362 for his largest percentage in the nation. The state officials elected in Nov. 1940, in addition to Governor Bushfield were: lieutenant governor, A. C. Miller; secretary of state, Olive A. Ringsrud; auditor, W. W. Warner; treasurer, W. G. Douglas; commissioner of schools and public lands, Earl A. Hammerquist; attorney general, Leo A. Temmey; superintendent of public instruction, John F. Hines; public utilities commissioner, C. L. Doherty; judges of supreme court, H. B. Rudolph and St. Clair Smith. All except the lieutenant governor were re-elected.

Bushfield began his second term as governor Jan. 7, 1941. The state legislature met in its 27th regular session for 60 days, passing amendatory, regulatory and routine laws necessary to the conduct of state business. Reduction of the general sales tax from 3% to 2% and modification of the state income tax met with popular approval. Of 766 bills introduced, 375 became laws. The great Rushmore memorial in the Black hills was completed by Lincoln Borglum, who carried out the design of his sculptor father, Gutzon Borglum. The number of tourists passed the 1,000,000 mark, many drawn to the state by the Rushmore project.

In addition to retaining complete control of the state administration in the election of Nov. 3, 1942, Republicans won the sole congressional seat held by Democrats. In a listless campaign, Governor Bushfield was elected to the U.S. senate over former Democratic Governor Tom Berry, who had defeated Senator W. J. Bulow in the primary election. Congressmen Francis Case and Karl Mundt won re-election handily. Nominated in convention after a four-man contest in the primary had failed to produce a Republican gubernatorial nominee, M. Q. Sharpe, former attorney general, carried the whole state ticket to victory in the November election. Republicans won 100 of 110 seats in the 1943 state legislature.

Sharpe took office Jan. 5, 1943. The legislature was in session from Jan. 5 to March 5. In addition to routine legislation, administration-backed laws were passed providing for tithes from specified departments; establishing a department of audits and accounts under a comptroller; reducing the unemployment commission to one member; and authorizing a study of compulsory education through high school. The tithing law met vigorous opposition from sportsmen and from gasoline taxpayers. An action in the state supreme court nullified the law as it applied to the highway department and permitted it to be referred. Although opponents of the law circulated petitions to refer it, the referendum was denied on the grounds of insufficient legal signers.

The legislature met in special session on July 10, 1944, to enact four measures dealing with soldier voting, education for veterans, the creation of a veterans' department of five members and the establishment of a \$50,000 war veterans' fund available for loans to dependents or veterans during the period when applications for federal benefits were being adjudicated. The Republicans carried the state on Nov. 7, 1944, re-electing by a wide margin Governor Sharpe, Senator Chan Gurney and Congressmen Case and Mundt. They also won 107 out of 110 seats in the legislature. Thomas E. Dewey received 135,365 votes to 96,711 for Franklin D. Roosevelt, in the presidential election. Other state officials elected included: Sioux K. Grigsby, lieutenant governor; George T. Michelson, attorney general; Mrs. L. M. Larson, secretary of state;

E. V. Youngquist, treasurer. J. F. Hines was re-elected superintendent of public instruction without opposition on a nonpartisan ballot.

Legislative enactments during the 60-day session ending March 2, 1945, included the creation of a state conservation commission; activation of a state teachers' pension and annuity system; reduction of the ore tax from 6% to 4%; increased old-age assistance benefits; and an increase in state aid to education from \$1,165,000 to \$2,625,000. Hazel Dean succeeded E. V. Youngquist as state treasurer.

The Republican party won all state offices in Nov. 1946, polling 108,998 against 53,294 votes in the contest for governor. State officials elected included: George T. Mickelson, governor; Sioux K. Grigsby, lieutenant governor; Sigurd Anderson, attorney-general; Miss Annamae Riff, secretary of state; Clarence Buehler, treasurer.

South Tyrol

As a result of World War I Austria ceded to Italy the South Tyrol, which was constituted as the Italian province of Venezia Tridentina with an area of 5,250 sq.mi. and a population (1936) of 669,029. It was divided into two departments, Trento or Trient in the south (area: 2,515 sq.mi. and pop. 391,309) and Bolzano or Bozen, sometimes also called Alto Adige or Ober-Etsch according to the chief river, in the north (area: 2,735 sq.mi. and pop. 277,720). While Trento had a predominantly Italian populationaccording to the census of 1910 there were 360,847 Italians and Ladins and only 13,450 Germans,—the department of Bolzano was predominantly German-in 1910 there were 215,796 Germans and only 22,500 Italians and Ladins. In spite of solemn pledges given in 1919 by the Italian government assuring a fair treatment for the compact German minority, the Austro-German population was subjected to severe persecution, perhaps the worst any minority suffered before Adolf Hitler's rise to power. The Italian government tried to Italianize completely the territory of Bolzano and north to the Brenner pass. In spite of all these efforts the Germans in South Tyrol survived and retained their language and national character and their desire to be re-united with Austria.

After World War II the Austrian government presented in Nov. 1945 a formal note to the Allies demanding the return of the German-speaking parts of South Tyrol to Austria. It pointed out the unanimous will of the population for such a return, and stressed the economic necessity and the vital importance of the territory for Austria's communications. Italy pleaded the retention of Austrian South Tyrol purely for strategic reasons, regarding the Brenner pass as a military asset of great importance. In 1946 the foreign secretaries of the great four Allied Powers decided in favour of Italy. (H. Ko.)

Soybeans

World production of soybeans was long confined to China and Manchuria. Since the crop grows best in the same climatic conditions as corn, it was later introduced into the Danube basin of southeastern Europe. The prewar world crop, 1935–39, was estimated at 458,300,000 bu., of which 204,444,000 bu. were grown in China, 151,204,000 bu. in Manchuria, 56,167,000 bu. in the United States, 19,303,000 bu. in Korea, 12,499,000 bu. in Japan, 9,731,000 bu. in the Dutch East Indies and about 2,400,000 bu. in Europe. Canada produced only about 207,000 bu. World production was estimated to have increased to 567,000,000 bu. by 1944, the greatest gains being in the United States and Canada, where the crop was about three times the prewar output.

The soybean was slow to find its place in United States agriculture, although it had been an important food in China for 5,000 years. Before World War I it was little known and grew in favour slowly until 1930, when it began to expand rapidly. By 1946 it was one of the ten leading U.S. crops. Soybean production had increased fortyfold within 20 years and had doubled in the decade 1937–46. When World War II began in 1939, soybeans at once became a critical war crop to supply domestic needs for vegetable oil because far eastern sources were cut off. The acreage in the United States grown for beans was increased from less than 4,000,000 ac. in 1937 to more than 10,000,000 ac. in 1943, after which there was a decline. Production in 1944–46 continued high but not quite equal to the 1943 record.

Soybeans are grown for three purposes, viz: for the beans, for the hay and to be grazed or hogged off as pasture. Until 1940, the U.S. acreage grown for hay was larger than that for beans, but the war demand stimulated greater production for the oil-bearing bean; the acreage grown for hay declined to the level of 1933. The area grown for grazing also declined but not in such a large proportion. With the development of markets for soybeans crushed for oil, the proportion grown for beans expanded. In 1939, only 40% of the acreage was harvested for beans, but by 1944 more than 72% was grown for oil. At first, the crop was grown primarily in the southeastern states for hay and grazing, and beans were gathered only for seed. It was not considered a reliable crop in the northern states, but plant breeders developed quicker-maturing varieties for the shorter northern season. By 1946 the crop was produced primarily in the corn belt states. About 80% of the total acreage was grown in five states-Ohio, Indiana, Illinois, Iowa and Missouri-during the period 1941-46. Production was still large in the lower Mississippi valley and on the Atlantic seaboard from Pennsylvania to South Carolina. The improvement of varieties of soybeans was advanced rapidly by the plant breeders until there were more than 100 varieties adapted to a wide variety of soil and climatic conditions.

The use of soybeans before 1928 was principally for seed and feed in the United States. The processing for oil and feeds began to increase rapidly in the early 1930s until the amount used by mills increased suddenly from 9,105,000 bu. in 1935 to 25,181,000 bu. in 1936, or about half the harvested crop. This change continued until, in 1943, about 74% was processed. Imports of soybeans had been small, except during World War I, when large quantities were imported from Manchuria and crushed in cottonseed oil mills in the southern states. Exports were also small, except in a few years when 2,000,000 to 4,000,000 bu. were exported, and the one year 1939, when exports

amounted to 10,949,000 bu. Processing for oil and meal began in 1910, when a small quantity of Manchurian beans was imported for crushing. The number of soybean-crushing plants was small before 1930, but by 1940 they numbered about 100. Stimulated by the demand for oil and feed during World War II, the number of plants was rapidly increased in 1944 to about 140 with a capacity of about 172,000,000 bu. Mills designed to use other oilseeds were also used to crush soybeans. The domestic production of oil meal and cake increased from 724,000 tons in 1937 to 3,444,000 tons in 1944. About 90% of these products was used as livestock feed. Domestic oil production rose from 194,411,000 lb. in 1937 to 1,235,806,000 lb. in 1944.

U.S. imports of soybean oil were large in the period 1920–40. This oil was first used in soapmaking, then its adaptability led to increased consumption in cooking oils, margarine, other edible products, and as a drying oil. After domestic production increased, imports shrank to very small quantities.

Prices of soybeans to U.S. growers were steady at about 80 cents per bu. in 1937 but advanced in 1941 to \$1.55 per bu. and to an annual average of \$2.08 per bu. in 1944. The government stimulated production in 1942 by offering \$1.55 per bu. to growers. This support price was increased to \$2.04 for the 1944 and 1945 crops. The value to processors was \$1.70 to \$1.75 per bu., the difference being paid as a subsidy by the Commodity Credit corporation. (See also Chemurgy; Vegetable Oils and Animal Fats.)

Spaak, Paul-Henri

Spaak (1899-), Belgian statesman, was born Jan. 25, 1899, in Brussels. At the age of 17, he attempted to cross from German-occupied Belgium into neutral Holland, but was captured and interned until after the armistice of 1918. He studied law at the Université Libre de Bruxelles, where he received his law degree. Admitted to the bar, he practiced law in Brussels. Spaak, who acquired his socialism from his mother (the first woman senator of Belgium) was elected as Socialist member from Brussels to the chamber of deputies. In 1935, he was named minister of transport, post and telegraph in the Van Zeeland cabinet, and the following year he was named foreign minister. At the time, the Belgian government rejected British and French promises of military support, hoping to remain strictly neutral. As a result, Spaak, who supported this view, conducted negotiations releasing Belgium from its commitments under the Locarno pact and the Anglo-

French-Belgian agreements. He formed a government in May 1938, but was compelled to resign in Feb. 1939, and was succeeded by Hubert Pierlot. Spaak again became foreign minister at the outbreak of World War II on Sept. 3, 1939. He fled Belgium after the collapse of Allied resistance in the summer of 1940 and went to England, where he became foreign minister and minister of labour in the Belgian government-in-exile. In Feb. 1945, he was retained as foreign minister and deputy prime minister in the Van Acker government established on Belgian soil, and the following April he headed his country's delegation to the U.N. conference at San Francisco. At the opening session of the U.N. general assembly meeting in London, Spaak was elected president of the general assembly by a 28 to 23 vote on Jan. 10, 1946, defeating Trygve Lie, who later was elected to the post of secretary general of the security council.

Spaatz, Carl

Spaatz (1891-), U.S. army air officer, was born June 28, 1891, in Boyertown, Pa. A graduate of the U.S. Military academy, West Point, N.Y., 1914, he participated in the Mexican campaign in 1916. During World War I, he commanded a pursuit squadron in the St. Mihiel offensive, 1918, and was awarded the distinguished service cross. After the war, he advanced rapidly in the air corps, becoming chief of staff to Gen. Henry H. Arnold, 1941, and U.S. air commander in Europe, July 1942. Early the following year, he was shifted to the Mediterranean theatre as commander of the 12th air force in Africa. His appointment as commander of the U.S. strategic bombing forces operating against Germany was announced by Pres. F. D. Roosevelt on Dec. 24, 1943.

During 1944 and 1945, bombers under Spaatz's command subjected Germany and German-occupied areas in Europe to intense aerial attacks. Spaatz represented the U.S. at the German surrender ceremonies in Berlin May 8, 1945. After the end of the war in Europe, he was made commander of the newly-created U.S. strategic air force in the Pacific in July 1945. Promoted to the permanent rank of major general, Jan. 22, 1946, he was named two days later (Jan. 24) to succeed Gen. Arnold as commander of all U.S. army air forces. On April 21, 1946, Spaatz urged that the army air forces be put in charge of guided-missile research.

Spain

A southwestern European state, Spain occupies about . 84% of the Iberian peninsula. After the Spanish civil war (1936–39), the chief of state (Caudillo) governed through a council of ministers not responsible to the parliament (Cortes). All political parties except the Falange were proscribed. The official religion was Roman Catholicism.

Manuel Azaña was president of the Spanish republic from May 1936 to Feb. 1939. Gen. Francisco Franco was head of the Spanish nationalist state after Oct. 1936.

The area of Spain (including the Balearic and Canary islands) is 194,945 sq.mi. The population was estimated at 25,220,000 in 1937 and 26,761,907 in 1944. By the census of Dec. 31, 1940, it was 25,877,971. Madrid is the capital. Chief cities (1944 est. pop.): Madrid (1,141,000); Barcelona (1,109,000); Valencia (508,000); Seville (348,000); Zaragoza (266,000); Málaga (259,000); Bilbao (208,000).

Political Facets of Civil War.—In July, 1936, a military uprising in Morocco plunged Spain into a civil war which ended with the final victory of the insurgents in March 1939. Although many factors underlying the revolutionary movement were misunderstood during the war period, in later years it became clear that the revolt against the second Spanish republic was inspired and materially aided by the totalitarian regimes of Italy and Germany. Ideologically and militarily Spain's civil war, as both sides proclaimed, was a tryout for World War II (see Spanish Civil War).

With Madrid under siege, the Republican capital was moved to Valencia in Nov. 1936. Here the Cortes met on Feb. 1, 1937, and granted the cabinet full powers over civil and military affairs. But the Republican, or Popular Front government, failed to hold in line the motley political groups pledged to defend the republic, and in May the Anarcho-Syndicalists staged a revolt which subjected Barcelona to the horrors of a civil war within a civil war. The defeat of the Syndicalists strengthened the hand of the Communists, two of whom entered the cabinet formed by Dr. Juan Negrín. On Oct. 1, 1937, the Cortes reconvened in Valencia, but at the end of the month political and military reverses dictated the removal of the government to Barcelona.

In Nationalist Spain an outstanding political development was the decree of April 19, 1937, which announced the 26-point Falangist program and merged the Falange and the Requetés into a single party, thereafter known as the Falange Española Tradicionalista y de las J.O.N.S. (generally shortened to F.E.T.). The same decree instituted a national council to study "the great national problems" of "the new totalitarian state."

Nonintervention was the keynote of international conferences on the Spanish question. In Jan. 1937 the U.S. applied the Neutrality act to Spain, thus blocking the flow of war materials which the Republicans planned to acquire in the U.S.; but European sources continued to furnish munitions and "volunteers" to both sides in defiance of the Nonintervention agreement of Sept. 1936. The control scheme adopted by the Nonintervention committee went into effect in April, with non-Spanish observers policing the land frontiers while British, French, German and Italian ships patrolled the coasts. Germany and Italy soon withdrew from the naval patrol, forcing the committee to search for a new formula for blocking foreign aid and withdrawing volunteers.

The committee tried repeatedly during 1938 to implement the plan for the repatriation of volunteers. After the Republican government had promised unilateral action, withdrawing volunteers under the supervision of the league council, the Nationalist regime responded favourably, and the first contingent of Italian troops sailed from Cádiz in Oct. 1938.

The Republican offensive, started in Dec. 1937, led to short-lived victories on the Aragonese front. After recapturing Teruel, Gen. Franco launched the drive which pushed through to the Mediterranean and cut Republican Spain in two. The breaking of communications between Barcelona and Madrid led to the appointment of Gen. José Miaja as military commander and civil governor of Republican Central Spain. After a crisis in April, 1938, Negrín's government was reconstituted to include representatives of seven groups supporting the republic: Socialists, Republican Lefts, Anarcho-Syndicalists, Communists, Republican Union, Basque Nationalists and the Catalan Esquerra. In May Negrín announced 13 Republican war aims, including a plebiscite to determine the form of gov-

ernment after the war. But neither this pronouncement nor the declaration (in the Cortes' October meeting) of the government's desire to explore the possibilities for a negotiated peace moved Franco from his insistence upon unconditional surrender.

Spain's appeal to the League of Nations for the right to buy war materials abroad fell on barren ground, while in the U.S. a movement to lift the arms embargo failed to win sufficient support. Severe air raids were frequent in Republican Spain. A British commission to visit bombed cities reported in Sept. 1938 that most of the attacks were made on military objectives, but more than one raid (such as that on Torrevieja) was described as a premeditated attack on civilians.

Food shortages were acute. A League of Nations commission visiting the Republican territory found widespread malnutrition among the civilian population, swelled as it was by more than 2,000,000 refugees from Nationalist Spain. In Dec. 1938, after a two years' ban on religious services, the Republican government reaffirmed the constitutional guarantees of religious freedom and appointed a commissariat-general of worship.

In Nationalist Spain the technical council of state, created three months after the outbreak of war, became a ministerial government under the decree of Jan. 30, 1938, with Gen. Franco as president of the cabinet and head of all the armed forces. The Labour charter, promulgated in March, revealed in broad outline the projected national-syndicalist structure of the totalitarian economy. In April 1938, the Jesuits recovered the privileges and property rights they enjoyed upon their expulsion in the early days of the republic; and in December the government restored to ex-King Alphonso the civil rights taken away from him in 1931.

Gen. Franco's final drive commenced in Dec. 1938, and, although a counteroffensive was launched by Gen. Miaja, the Nationalist forces advanced with no important setback. With the fall of Barcelona (Jan. 26, 1939) the Re publican government moved to Gerona, and from there to Figueras, where the last meeting of the Cortes took place on Feb. 1. Determined "to continue the struggle until conditions assuring the independence of the country . . . are achieved," Negrín's cabinet returned to Madrid; but Pres. Azaña, believing that continued resistance was hopeless, fled to Paris and on Feb. 27, 1939, resigned his office.

The return of the cabinet to Madrid occasioned another civil war within the civil war. On March 6, Gen. Miaja and Col. Casado organized a putsch which overthrew the Negrín government. Negrín fled, but his supporters took up arms against Miaja's National Council of Defense. The revolt suppressed, the council began negotiating with Franco (as, apparently, the Negrín government had intended to do). Nationalist forces entered Madrid on March 28, and within a few days all open resistance ended. England and France had recognized the Franco government on Feb. 27; the U.S. followed suit on April 1.

Franco's Shifting Foreign Relations.—Shortly before the end of hostilities the Nationalist government adhered to the anti-Comintern pact, and in May announced its withdrawal from the League of Nations. But at the outbreak of World War II, Franco immediately reaffirmed Spain's neutrality. The Russo-German alliance and the invasion of Catholic Poland came as a great shock to the axis' former partner-in-arms against communism. With Portugal, the third country to which the Nationalists were indebted for aid in the civil war, Spain concluded a treaty of nonaggression and friendship /March), followed by a trade agreement in December.

In Spanish relations with France, gold and refugees were the main issues. By the end of March, 500,000 refugees had left Spain and taken up a precarious existence in French internment camps. The Spanish government was unprepared to arrange for their immediate repatriation, though agreeing to contribute to the maintenance of those left in France; and at the end of 1938 France was still the involuntary host to more than 100,000 Spaniards. In July, pursuant to a ruling of French courts, more than \$30,000,000 of the gold which the Republican government had shipped to France was delivered to the Bank of Spain.

The German victories of 1940 and Italy's entry into World War II encouraged Spain to abandon strict neutrality and to proclaim (June 12) a policy of "nonbelligerency." Public demonstrations demanded Gibraltar and occupation of the International Zone of Morocco, despite British protests. Ramón Serrano Suñer, a rabid partisan of the axis, was appointed foreign minister. Franco's declaration of his intention "to forge an empire" supported Winston Churchill's statement that Spain "seemed to hang in the balance between peace and war." Later, it became known that Spain demanded territorial concessions, including Gibraltar and French Morocco, and military and economic assistance sufficient to make up for her dearth of munitions and foodstuffs as conditions for entering World War II. On Aug. 15, 1940, Franco told Benito Mussolini, Spain would go to war "at a favourable opportunity in proportion to the means at our disposal." The duce replied that although Spain needed a long period of recuperation, "events will not permit it, and your domestic economic condition will not get worse when you change from nonbelligerency to intervention." Franco hesitated. Adolf Hitler, in conversations with Count Galeazzo Ciano, noted caustically that the exorbitant demands for grain and armaments in exchange for Spanish "friendship" showed that Spain lacked "the same intensity of will for giving as for taking." Finally accepting Franco's invitation, Hitler journeyed to Hendaye in Oct. 1940 for talks with the Caudillo. No agreements were reached, but in December Hitler informed Franco of a plan to send troops through Spain for an attack upon Gibraltar. Franco demurred, protesting "absolutely inadequate" food supplies and insufficient preparation to enter the war as early as Jan. 1941. At the end of 1940 one concrete move toward belligerency was made: Spain agreed to permit German tankers to use sheltered bays along the Cantabrian coast for refuelling submarines.

While carrying on this flirtation with the axis, Spain improved her economic position vis-d-vis the non-axis countries, especially England. The Anglo-Spanish trade agreement signed in March 1940 provided a loan of £2,000,000 for purchases within the sterling area, while Spain undertook to resume payment on the outstanding commercial debts of about £7,000,000. A tripartite payments and trade agreement (England-Portugal-Spain) was concluded in July, and in September arrangements were made for oil imports under British navicerts, with guarantees against re-export.

In the Italian debt agreement of May 8, 1940, Spain undertook to pay in 25 instalments the sum of 5,000,000,000 lire for Italian assistance in the civil war. Hitler stated privately that the Spanish debt to Germany amounted to 400,000,000 marks but that Spain had been unwilling to discuss repayment.

Spain continued to give aid and comfort to the axis nations throughout 1941. In March the German consulate

in Tangier was reopened, less for the sake of commercial contacts than for facilitating espionage in the Mediterranean area. Germany's attack upon the U.S.S.R. inspired the recruiting of the Spanish "Blue Division" to fight on the eastern front, enthusiasm for which was echoed by Serrano Suñer. "The extermination of Russia," he said, "is an exigency of history and of the future of Spain." But the government was not persuaded to abandon its nonbelligerent status. Hitler, still chiding Franco for spurning the proposal for entering the war, belittled Spain's economic difficulties, promised 100,000 tons of grain upon the declaration of war, and offered an equitable division of African colonial possessions. Franco replied that the Spanish people were "suffering the greatest starvation and enduring all sorts of privations and sacrifices" and that he could not demand greater sacrifices unless confident of a quick ending to the war.

Spain of necessity continued to maintain close economic ties with non-axis countries, however. New agreements with England enabled Spain to increase its imports of food and raw materials from sterling areas and to exchange oranges and mercury for British wheat and rubber. A trade agreement with Argentina further augmented Spain's supply of wheat, cotton and meat. Yet during most of the year there were shortages and hunger on every hand, and in April the American Red Cross donated to the Spanish people considerable quantities of milk, flour and medicine.

Eulogizing the German desense of Europe from the menace of Communism, Franco promised that if Berlin were endangered, not a division but 1,000,000 Spaniards would volunteer to defend the German capital. In another speech (July 1942) the Caudillo asserted that totalitarianism had "amply demonstrated its superiority" over demociatic institutions. "For the countries of Europe," he said, "there exists a single danger . . . Communism." He later told Hitler he was praying for German victory "in the glorious undertaking of liberating Europe from bolshevik terror."

Other developments revealed Spain's reluctance to join the axis in a "shooting" war. Ramón Serrano Suñer was dismissed without explanation in Sept. 1942 and was replaced in the foreign office by Count Francisco Gómez Jordana y Souza, a monarchist friendly to the U.S. and Great Britain. Roosevelt personally advised Franco that the landing of U.S. troops in North Africa was "in no shape, manner, or form directed against the government and people of Spain . . . Spain has nothing to fear from the United Nations." Spain replied by partially mobilizing its armed forces, with the announced purpose of guaranteeing its isolation from the struggle. U.S. Ambassador Carlton Hayes reported that at the end of 1942 Spain was ready to enter the war on the Allied side in the event that Germany undertook military operations on Spanish territory.

In a secret agreement of Feb. 10, 1943, Germany promised "to deliver to the Spanish army in the shortest time possible... war material of modern quality"; in return, Spain covenanted "to resist every entry by Anglo-American forces upon the Iberian peninsula or upon Spanish territory outside of the peninsula." The hour for Spain's voluntary entry into the war had definitely passed. In April and May 1943, the government put out peace feelers, motivated by the belief that the war had reached a stalemate. Not until the last half of the year, however, were doubts of axis victory made public. In July the censor-

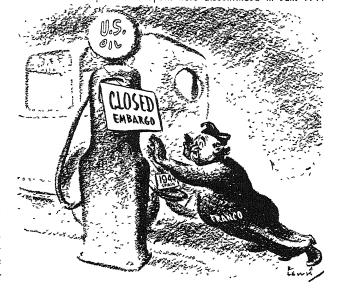

ship of German news agencies was reimposed; in August Spanish newspapers were permitted to say that Allied military aims might be realized; and in October the Caudillo defined the Spanish position as one of "vigilant neutrality," ostensibly retracting the nonbelligerency adopted in 1940.

The slight improvement in relations with the United Nations was offset by the congratulations which the foreign office sent to the Japanese puppet government in the Philippines. U.S. protests brought a prompt denial of Spain's friendship for Japan and of any intention to recognize the Laurel government. The announcement of Nov. 1943 that the Blue division had been withdrawn only partially satisfied Allied demands, since Spaniards were permitted to remain on the eastern front as "legionnaires." In conversations with Franco the following month, the German ambassador disclosed Hitler's displeasure over the change in Spanish policy, citing the "unjustified internment" of U-boat crews and the passage of French fugitives through Spain to Africa as examples of pro-Allied collaboration. Franco denied (with what sincerity, it was impossible to say) any change in his policy, since "he knew for certain . . . that only the victory of Germany would make possible the continued existence of the regime ... [while] a victory of the Anglo-Saxons ... would mean his own annihilation."

Still "economically very dependent" (as Franco pointed out to the German ambassador), Spain was forced to yield to Allied pressure in exchange for promises of food and oil. Great Britain and the U.S. agreed to supply 100,000 tons of cotton in 1943, or enough to restore consumption to normal levels. Under the plan worked out by the British and U.S. Boards of Economic Warfare, Spain was allowed to import 541,000 tons of petroleum, or not more than 60% of normal requirements. Allied preclusive buying furnished a market (at constantly rising prices) for such varied products as sheepskins, woollens, fluor spar and wolfram. Spanish statistical sources revealed that the Allies acquired 77% of the 3,003 tons of wolfram for which export licences were granted in 1943.

Spain's abandonment of nonbelligerency did not immediately yield the advantages anticipated by the Allied governments. The continued exportation of strategic minerals to Germany, the persistence of German espionage

"What Now, Little Man?" inquired Lewis in the Milwaukee Journal after U.S. oil shipments to Spain were discontinued in Jan. 1944

on Spanish soil and attacks upon British and U.S consulates cast some doubts upon Spain's strictly neutral position. In Jan. 1944 the government's refusal to embargo wolfram shipments to Germany led to a crisis in relations with the U.S. and the halting of petroleum imports, which virtually paralyzed the motor transport system. The ban was lifted in May, but not until Spain agreed to release certain Italian ships detained in Spanish ports, withdraw all military personnel from the eastern front, expel designated axis agents from Spain and Morocco, close the German consulate in Tangier, and cut to a trickle exports of wolfram to Germany.

The military reverses of Germany and, following the liberation of France, the removal of nazi troops from the Spanish border were decided stimulants to the reorientation of the country's foreign policy. But official Spain continued to insist that the Allied war aims were meaningless, and in July 1944 Franco repeated his offer of Spain's good offices in negotiating a peace. The press disparaged the Atlantic charter and predicted that a United Nations victory would only lead to Russian domination of Europe. In a letter to Churchill the Caudillo suggested that, "since we cannot believe in the good faith of Communist Russia and since we know the insidious power of Bolshevism," it would be wise to form an anti-communist bloc. In response to suggestions that Spain might furnish a haven for war criminals, the government stated that "no one has ever contemplated providing a hiding place in Spain for the enemies of the Allied countries" and added that "the Spanish regime has nothing in common with National Socialism, which is condemned by the church, while Spain's own regime is essentially based on Christian principles." Although in Nov. 1944 Franco described the Spanish state as one of "organic democracy," his bid for an invitation to the peace conferences was accorded a trigid reception. Relaxation of press and censorship regulations enabled the British and U.S. information agencies to present the case for the United Nations more effectively.

The Franco government in 1945 weathered a rising storm of foreign criticism but only at the expense of isolation from the current of international affairs. In March the country was thoroughly aroused by Japanese atrocities in the Philippines; and within a month the break in diplomatic relations ensued. As Allied armies were delivering the blows which led to Germany's unconditional surrender, the government blocked all axis-controlled assets in Spain; but only at the very end (May 7) did Spain sever relations with Germany. Pierre Laval, who fled to Spain in May, was expelled at the request of the Allies.

Domestic Problems, 1939-45.—Although reconstruction following the civil war was the major problem of 1939 a number of political changes were affected. In the face of internal bickering, Franco reorganized the F.E.T., giving the Falangist elements a predominant place in the new state. The Caudillo, by virtue of a decree of July 31, 1939, assumed "in its entire plenitude the most absolute authority. The Chief is responsible only to God and to History."

Rationing and drastic measures against hoarding and profiteering were adopted immediately after the fall of Madrid. In April 1939 the women's social service was distributing 1,500,000 rations daily in Madrid alone. To speed the work of reconstruction, Franco "adopted" the most severely damaged towns and granted extraordinary credits for the building of houses, the repair of public buildings, and the rehabilitation of the transport system. Long-range industrial development was anticipated by the decree of Oct., 24, 1939, which authorized the National Industrial institute to intervene in the management of in-

dustries of "national interest" in exchange for preferential tax treatment and a guarantee of earnings. Official unemployment statistics, beginning with Sept. 1939, showed a decrease in the number of idle from 600,000 in September to less than 450,000 in December.

The significant Law of Syndical Unification was published in Jan. 1940. So-called vertical syndicates, after the fashion of the Italian corporations, supplanted all trade unions and employers' associations. Syndicalist Centrals co-ordinated the national syndicates on a regional basis; at the top the organization was controlled by the National Syndicalist delegation of the Falange. In the words of the more detailed measures published in Dec. 1940, "the law insures the subordination of the syndicalist organization to the Party, since only the Party can infuse in it the discipline, unity and viewpoint necessary to make the national economy subserve the national policy." Following repeal of the Agrarian Reform law of 1932, a new National Institute of Colonization was established to carry out a program of rural electrification, irrigation and reforestation in place of the land-tenure reforms projected under the republic.

Social legislation included a law for the suppression of freemasonry and communism (March 1940) and the decree for the establishment of the Consejo de la Hispanidad, an organization avowedly designed for cultural rapprochement with the Hispanic nations.

There were further indications during the following year of the socializing effects of National Syndicalism: in Feb. 1941 the decree nationalizing the railroads became effective, and in September all tin, copper, aluminum, zinc, manganese, nickel, chromium and tungsten mines, declared to be "of national interest," were brought under the program of state aid and control. New legislation expanded the coverage and benefits of social security, including marriage loans and family subsidies. "Only nations of prolific families," explained the decree of Aug. 1, 1941, "can expand the race throughout the world and create and maintain empires." Government statisticians talked of increasing Spain's population to 40,000,000 by 1984.

The tribunal appointed to judge masons and communists handed down a number of sentences, including long prison terms for Negrín, Jiménez Asua, Victoria Kent and other outstanding Republicans. On Columbus day (Oct. 12), "Hispanidad" was again proclaimed as a purely spiritual and cultural program, but within the month Cuba requested the removal of the press attaché in the Spanish embassy on the grounds of political activity inimical to Cuban foreign policy.

Under the terms of an agreement with the Holy See, signed on June 7, the Spanish government secured the right to fill episcopal vacancies after submitting a panel of nominees to the pope.

By a law of July 17, 1942, a new type of cortes described as "the superior organism of the participation of the Spanish people in the work of the state" was created. "The principal mission of the Cortes is the planning and formulation of laws, without prejudice to the veto power which belongs to the head of the state." Party officials, presidents of learned societies, and certain public officials became members ex-officio; other members were appointed by the caudillo, and a third of the membership was subject to election by the national syndicates.

On the economic front, shortages of food and raw materials still hampered plans for development and reconstruction. Limited supplies were made available by the

Allied nations, while trade agreements with Argentina made it possible to exchange Spanish ores and manufactures for Argentine grain and tobacco. Allied economic warfare led to large-scale preemptive buying in an effort to keep wolfram, mercury and other strategic commodities out of axis hands. As a result, Spain acquired large reserves of foreign exchange, and in 1942 the balance of trade was favourable for the first time since 1930.

In March 1942 the government repudiated the note issues and a large part of the deposit liabilities of the Republican Bank of Spain. Deficit financing, the enormous cost of reconstruction, and the European war contributed to the persistent inflationary tendencies of the post-civil war period. By the end of 1942, prices and the cost of living were about two-thirds greater than in 1939, but unemployment was less than half the figure reported in Dec. 1939.

In 1943 except for the disbanding of the Falangist militia in December, the political and social program of the totalitarian state suffered no radical transformation. At the opening of the cortes in March 1943, Pres. Esteban Bilbao scoffed at "liberal regimes," "stupid parliaments," and "pharasaical democrats." In July the cortes approved a law for the administration of the universities, prescribing courses of study for the "political" indoctrination of students. Professors were required to submit syllabi of their courses prior to the opening of classes, and the student body was linked to the Falange by one of the ubiquitous syndicates. The national budget, with expenditures set at almost 10,000,000,000 pesetas (4,700,000,000 in 1935; 7,200,000,000 in 1940), revealed the increasing role of the state in social and economic undertakings, although allowance must be made for the rising price level.

In March 1944 four university professors were arrested for signing a memorandum in favour of Don Juan, claimant to the Spanish throne after the death of his father, ex-king Alphonso, on Feb. 28, 1941. From exile the pretender announced his complete lack of sympathy with the Franco regime. Meanwhile, restoration of the monarchy continued to be a forbidden topic.

Other expatriates kept up their propaganda for the restoration of parliamentary government, demanding the withdrawal of Franco in favour of the "third" Spanish republic. Late in 1944 guerrilla bands operating out of the French Pyrenees harassed northern Catalonia, but their marauding was more annoying than menacing.

In the sixth year after the civil war Spain was still struggling with a gigantic task of reconstruction, a task whose burden in some sectors of the economy was increased by the European war. Adverse weather, coupled with acute shortages of fertilizer, kept the production of most major crops below prewar levels, and drought severely curtailed the output of hydroelectric power. Scarcity of articles of necessity persisted; prices and the cost of living continued to rise; but unemployment dropped to the relatively low figure of 166,000 (May).

Postwar Difficulties.—At the Potsdam conference in 1945, England, Russia and the U.S. declared they "would not favour any application for membership" in the United Nations "put forward by the present Spanish government, which . . . does not, in view of its origins, its nature, its record and its close association with the aggressor states, possess the qualifications necessary to justify such membership." Replying to a message from the caudillo, Churchill cited the unilateral change in the status of Tangier as one reason for distrust of Spain's attempted rapprochement

with the Allies. In Aug. 1945 the Morocco question was studied by experts representing Great Britain, France, Russia and the U.S., and, pursuant to the four-power agreement, in October Spain withdrew from the administration of the International Zone in favour of a committee of control.

Susceptible to foreign antipathy, the government made every effort to disassociate foreign policy from its domestic program. The official attitude was expressed by Foreign Minister José Felix Lequerica, who asserted that "the internal regime, purely Spanish, created by Spaniards and defended by them, has nothing to do with its foreign policy."

Several Latin American countries broke diplomatic relations with the Franco government; but England and the U.S., despite strong demands from certain segments of public opinion, hesitated to take this drastic step. In Mexico, where the Franco regime had never been recognized, the Spanish Committee of Liberation made some progress in harmonizing the divergent ambitions of the exiled groups working for Franco's overthrow and in Aug. 1945 formed a government-in-exile headed by Martínez Barrio (president) and José Giral (premier). Eschewing violence, the anti-Franco forces advocated a plebiscite which they hoped economic sanctions and diplomatic pressure would force Franco to accept.

Denouncing the Franco government as dictatorial, the pretender-asserted that a constitutional monarchy "alone [could] provide an effective guarantee for religion, order and liberty." The Duke of Alba, considering the regime "harmful to the best interests of Spain," strengthened the hand of the monarchists by resigning his post as ambassador to England. Franco himself declared his hope that the cortes would prepare legislation to bring about the restoration.

Internally, the regime made a few polite bows to liberalism. Franco described the nation as a "Catholic state, eminently socialized . . . in which all Spaniards are equal before the law"; and in May 1945 he declared that "Spain is not a dictatorship." A cabinet shakeup in July, giving monarchists and non-Falangists a majority, was called a "further stage in Spain's spiritual and material reconstruction." An electoral census was conducted and lists of electors posted in Madrid, though no occasion was offered for the exercise of suffrage. The tribunal of political responsibilities was abolished in June, 1945 and in October full pardon was extended to prisoners convicted of political offenses committed before the end of the civil war. A bill of rights, based on the constitution of 1876, was approved by the cortes in July; but amendments to the penal code made blasphemy, contravention of the labour laws and disparagement of the regime criminal offenses.

Weather, war and politics combined to induce unfavourable economic conditions. With grain harvests abnormally low, because of the lack of fertilizer and a drought said to be the worst in half a century, the country faced the necessity of importing almost half the normal requirements of cereals. The end of Allied preclusive buying and the loss of other markets not only reacted adversely upon mining and industrial activity but drained the supply of foreign exchange needed for making purchases abroad.

Spain's exclusion from the United Nations on Feb. 8, 1946, touched off a series of diplomatic duels. The three-power talks initiated by France in Dec. 1945 led to the joint announcement of March 4, 1946, that England, France and the U.S. hoped "leading patriotic and liberal-minded Spaniards may soon find means to bring about

Carnival figure representing Spain's housing problem, on display in Valencia during April 1946

a peaceful withdrawal of Franco, the abolition of the Falange and the establishment of an interim or caretaker government" pending the free choice of their form of government by the Spanish people. In April, Poland, after recognizing the government-in-exile, brought before the United Nations Security council a proposal for breaking relations with Spain "in view of the fact that the present regime . . . is endangering international peace." By unanimous action the council set up a subcommittee to investigate the Polish charges, and on June 1 the committee made its report. After pointing out that Franco had failed, and sometimes refused, to co-operate in ridding Europe of naziism and fascism (e.g., by continuing to harbour the Belgian quisling Léon Degrelle), the committee concluded that unjustifiable military strength and the existence of a rival government-in-exile constituted a potential threat to

Although the subcommittee pointed out that the council could take no action in the absence of an immediate threat to peace, Russia supported Poland in insisting upon a decision. Motions to accept the subcommittee's report and to refer the question to the assembly were defeated, as was the Polish resolution for the immediate severance of relations with Spain. The motion offered by Australia and England to keep the Spanish question on the agenda was upheld, and in the fall meeting of the council Russia and Poland were intent upon making it the order of day.

Meanwhile, the Spanish government accepted the challenge and in the case of France retaliated by closing the frontiers (Feb. 28, 1946). Representatives of friendly nations were invited to Spain to observe that, contrary to the Polish allegations, no German scientists were engaged

in atomic-bomb experimentation. At the opening of the cortes in May 1946, Franco declared that the law-making processes of the parliament disproved charges that his government was dictatorial and undemocratic; but Spain would rather live in "sacrificial isolation" than to acknowledge the competence of the United Nations to stand in judgment. By June, only 19 of the 51 members of the United Nations had diplomatic relations with Spain, while 7 recognized the government-in-exile. In September, Spain was explicitly debarred from the United Nations Food and Agriculture organization conference in Copenhagen, Denmark; and in October vigorous efforts were made to exclude her from the world court.

On other questions the position of the Spanish government was far from adamant. The Allied Control commission secured a satisfactory agreement for blocking business assets controlled by Germans in Spain; and by May, British sources acknowledged, the majority of German officials and military personnel had been sent back to Germany. A report on prison conditions, in response to British representations, indicated that political prisoners numbered less than 40,000 in May.

Don Juan journeyed to Portugal to talk with representatives of Gen. Franco, but no more tangible evidence emerged of the government's intentions toward the restoration. The concordat signed in July provided for the joint participation of the state and the Spanish church in the appointment of priests and dignitaries of the cathedrals.

In the economic sphere, Spain continued to suffer from low production, food shortages, rising prices and black markets. On the tenth anniversary of his rise to power (Oct. 1946) Franco admitted that the government's economic program had fallen short of its goals: industrial development, agricultural expansion and housing were

still lagging. Trade agreements with the Netherlands and Argentina in part relieved the domestic economy, furnishing grains and vegetables in exchange for Spanish fruits and manufactures. A treaty of commerce with Italy provided for an annual trade of 200,000,000 pesetas, but Spanish exports worth 150,000,000 were to be applied to the civil war debt. The 1946 budget (ordinary and extraordinary) called for expenditures of 13,200,000,000 pesetas, of which 5,400,000,000 represented appropriations for the military, naval and police forces. Inflationary tendencies were reflected by the rise in the note issue of the Bank of Spain to 18,900,000,000 pesetas in May (despite the ceiling of 18,000,000,000 imposed by law in March 1945). Unemployment, which reached a low of 123,000 in May 1945, rose to 177,000 in March 1946. The peseta was officially pegged at 10.95 to the U.S. dollar, although in August a "tourist" rate of 16.40 per U.S. dollar was introduced. (See also Fascism.)

Spangler, Harrison Earl

Spangler (1879—), U.S. lawyer and politician, was born June 10, 1879, in Guthrie county, Iowa. A graduate of Iowa university law college, Iowa City, he was admitted to the bar in 1905. Active in the Republican party, he became a member of the Republican national committee in 1931, and directed Alfred Landon's presidential campaign for the midwest area in 1936. After retirement of Joseph W. Martin as chairman of the Republican national committee in 1942, Spangler was elected to this post at the G.O.P. convention in St. Louis, Mo., in Dec. 1942. He proposed on April 11, 1943, to the Democrats that the Republican party would consider favourably suggestions for a short presidential campaign in 1944 provided "satisfactory assurances" were given that Franklin D. Roosevelt would refuse a fourth term. Spangler retired as chairman on June 29, 1944.

Spanish-American Literature

World War II was only one among three historical events which had an important bearing upon Spanish-American literature in the decade 1937–46, the other two being the Spanish Civil War and the Pan-American policy of the U.S. government under the guidance of Franklin D. Roosevelt. The Spanish question divided Latin America into two irreconcilable parties, just as it did in the Madre Patria. Friends of the Spanish republic spared no efforts in order to contribute to the defeat of Francisco Franco. They collected money, sent medical supplies, participated in active propaganda and, when they had the talent and the capacity, composed poetry in praise of the Republican armies. Some of the finest poetry produced by Spanish Americans dealt with the Spanish Civil War, such as Pablo Neruda's España en el Corazón (1937); Nicolás Guillén's España: Poema en cuatro angustias y una esperanza (1937); César Vallejo's España, aparta de mi este cáliz; A. Torres-Ríoseco's Canto a España Viva (1941).

World War II, on the other hand, had no direct impact on Spanish-American letters during the decade; and it was doubtful whether it ever would. Spanish America played an important but secondary role in the conflict, and only Brazil and Mexico sent armies to the battle fronts. Indirectly, however, the war brought about considerable changes in the literary world of the southern continent. It caused the largest Spanish publishing houses to move out of Europe and into Latin America. Espasa-Calpe established its headquarters in Buenos Aires, Argentina. Distinguished Spanish writers went into the publishing business and managed such enterprises as Losada and the already mentioned Espasa. Argentina, Mexico and, to a lesser extent, Chile took over the book markets of their sister republics and attained a rate and a quality of production never paralleled in the history of these countries. More and better books were published. Foreign authors— North American, French, Russian, British-were still favoured over the native writers, but this tendency was counteracted by the work of such institutions as the Fondo de Cultura Económica de Mexico, which began to organize a true encyclopaedia of Spanish America through the publication of outstanding works by native essayists, novelists, historians, etc. The war also accounted for the arrival in Latin America of refugees from Spain, Poland, Austria, Italy and other countries, who effectively contributed to the cultural progress of their countries of adoption. One of the best examples perhaps was that of Dr. A. Lipschutz, the eminent physiologist who, working in Chile, turned his attention to Spanish-American problems and produced a book of exceptional significance in El indoamericano y el problema racial en las Américas (1945).

In regard to Pan-Americanism, it was necessary to thank the good neighbour policy for making possible the publication of an increasing number of Spanish-American books in excellent English translations. Works by writers such as G. Freyre, G. Arciniegas, E. Mallea, E. Verissimo, among others, as well as classics such as E. d'Acunha's Os Sertões, R. Rojas' El Santo de la Espada, R. Palma's Tradiciones Peruanas reached the English-speaking public with various degrees of success. Poets like Neruda, J. Carrera Andrade, G. Mistral and many others were made known to the American Hispanists through the efforts of anthologists like H. R. Hays, Dudley Fitts, Dudley Poore and translators of such calibre as Muna Lee, A. Flores, H. de Onís, D. Craig, L. Mallan, S. G. Morley, etc. Scholars of great prestige continued the work begun by A. Coester and published general treatises on Spanish-American letters: A. Torres-Rioseco's The Epic of Latin American Literature, Rex Crawford's A Century of Latin American Thought, R. Spell's Contemporary Spanish American Fiction; the language was studied by C. E. Kany in his pioneer volume American-Spanish Syntax. Spanish-American writers and professors travelled through the United States and wrote articles and books giving their impressions: Erico Verissimo, Germán Arciniegas, Luis A. Sánchez, Manuel Seoane imitated John Gunther's "Inside" series in quick, subjective books about North America. P. Henríquez Ureña's Literary Currents in Hispanic America and G. Freyre's Brazil: an interpretation were a result of invitations to lecture in the United States; as likewise De la Conquista a la Independencia by M. Picón Salas, a charming display of erudition without pedantry. The "Good Neighbour" policy was also responsible for the two literary contests which the Pan American Union and the Farrar and Rinehart publishing house sponsored in 1942 and 1943, which resulted in hundreds of books being written and submitted to the national judges for a right to compete in New York. Winners of the awards—C. Alegría, G. Gilbert, M. L. Menéndez, P. and Ph. Thoby-Marcelin, A. Díaz Lozano and F. Alegría—saw their works published in English translations.

* * *

In a more detailed analysis of Spanish-American literature of the decade, one should emphasize, in the first place, the consistency with which old and new novelists subscribed to the ideas of criollismo or regionalism. The old masters continued to produce those long and minute descriptions of rural, provincial or city life with emphasis on the picturesque. In Mexico, M. Azuelas published Regina Landa (1939), Avanzada (1940) and La Merchanta (1945); J. R. Romero added to his list of poignantly realistic portrayals with Una vez fui rico (1942) and Rosenda (1946). In Chile M. Latorre was awarded the National Literature prize (1945) for his volumes of short stories Hombres y zonos, Mapu and Viento de Mallines, all dealing with country life among the colorful huasos; J. Edwards Belloalso received the same prize (1943) for his lively descriptions of Valparaíso in En el viejo Almendral. Other costumbrista novels were published by E. Barrios, L. Durand, J. M. Castro and L. Yankas. The Venezuelan R. Gallegos produced one of his most important novels in 1937: Pobre Negro, a book of social and psychological significance; in 1945 he published another story, Sobre la misma tierra, which, unfortunately, did not live up to his merits and had to be considered rather as a movie script than as a novel. The Argentinean M. Gálvez wrote a book of historical interest about a famous Ecuadorean character Vida de don Gabriel García Moreno (1943). A. Gerchunoff, Max Dickman and others struggled to give the Argentinean novel a more modern form and a broader

Younger novelists, in general, followed the realistic tradition, but became more conscious of social and economic problems. They denounced the persecution of Indian peoples in Peru-C. Alegría's El mundo es Ancho y Ajeno -in Ecuador-J. Icaza's En las Calles. They assailed the imperialistic ambitions of foreign powers-C. Uribe's Mancha de aceite, D. Aguilera Malta's Canal Zone. They described the incredible conditions in which workers laboured in coal mines: Juan Marín's Viento Negro; in copper mines: G. Drago's Cobre; in nitrate fields: A. Sabella's Norte Grande. Those interpreting the traditional gaucho or huaso theme managed to bring some novelty by analyzing psychological conflicts: E. Amorim's El caballo y su sombra (1941), or by giving an artistic treatment to an historical event: R. Lomboy's Ranquil (1943). Central-American rural life was described by the Guatemalan Flavio Herrera in El tigre (1942). The philosophical novel had two worthy representatives in E. Mallea of Argentina-Historia de una pasión argentina (1937), Fiesta en Noviembre (1938), etc., and in the more artistic and subtly pessimistic E. González of Chile (Noche, 1942).

The fact must be pointed out that Ecuador led Spanish America—with the possible exception of Brazil—in the novelistic production of the decade. Outstanding examples included J. Icaza's Cholos (1938); A. Pareja Diez-Canseco's Baldomera (1938); H. Salvador's Noviembre (1939); Trabajadores (1940) and Prometeo (1945); H. Matta's Sumag Allpa (1940) and Sanaguín (1942); E. Gil Gilbert's Nuestro Pan (1942); D. Aguilera Malta's La isla virgen (1943).

Imagination and psychological insight were displayed by such novelists as the Argentinean A. Gerchunoff in La

clinica del Dr. Mefistófeles (1937), the Guatemalan R. Arévalo Martínez in El mundo de los Maharachias (1938), the Chileans M. L. Bombal in La Amortajada (1938) and B. Subercaseaux in Daniel (1941).

A number of historical characters came to literary life through the biographical novels written by the Peruvians L. A. Sánchez (Garcilaso Inca de la Vega, 1939) and María Wiesse (José Carlos Mariátegui, 1945); by the Argentinean M. Gálvez (Vida de Hipólito Irigoyen, 1939); the Colombian G. Arciniegas (Jiménez de Quezada, 1939); the Cuban Feliz Lisasso (Pasión de Martí, 1938); the Honduran R. H. Valle (Iturbide, varón de Dios, 1944); the Chilean M. Petit (Diego Portales, 1937).

This powerful development of Spanish-American fiction was accompanied, and perhaps conditioned, by the exhausting criticism of A. Torres-Ríoseco, La novela en la América Hispana (1939–43) and L. A. Sánchez, América novela sin novelistas (1940, 2nd ed.). Critics were beginning to undertake the task of interpreting the works of the great old masters and so, for example, R. Silva Castro and H. Díaz Arieta wrote abundantly on the life and works of A. Blest Gana.

The importance of the Spanish Civil War in Latin-American poetry has already been mentioned. World War II inspired almost no one, P. Neruda being the exception because of his memorable Canto a Stalingrado. Neruda, moreover, became the greatest single influence in Spanish letters. He was either admired or attacked but left no one indifferent. His book Residencia en la Tierra offered a strange mixture of romantic, surrealistic, patriotic and revolutionary elements. Neruda created a style of his own, about which a book was written by the distinguished philologist Amado Alonso (Poesía y Estilo de Pablo Neruda, 1940). Chile could also be proud of Gabriela Mistral, winner of the Nobel prize in 1945 and author of Tala (1938), a serious attempt in the field of vernacular poetry. Other Chilean poets joined the already famous group of Neruda, Vicente Huidobro (Ver y Palpar, 1941) and Pablo de Rokha (Morfología del Espanto, 1943) to amaze, delight or disgust the reader with their adventures in experimental technics. Juvencio Valle and H. Díaz Casanueva were newcomers of indisputable talent; L. Merino, A. de Undurraga and other younger poets struggled wholeheartedly to come out of lifeless abstractions and into a poetry which was more humane and had a greater universal appeal. Mexico followed a more conservative pattern and its poetry shone especially in the refined spiritualism of Xavier Villaurrutia (Décima Muerte y otros poemas, 1941); La Nostalgia de la Muerte, 1938); in the virtuosity of Alfonso Reyes (Algunos Poemas, 1941) and the philosophical seriousness of Octavio Paz (A la Orilla del Mundo, 1943). E. González Martínez gave in 1940 and 1942 two examples of his mild lyricism: Poesía and Bajo el signo Mortal.

In 1945 he published the first volume of an interesting autobiography: El Hombre del Buho.

The Negro poetry of the Antilles was in full splendour, and Nicolás Guillén was a leader with numerous disciples. Another great poet, the Ecuadorean J. Carrera Andrade, kept his fame alive by publishing both in English and in Spanish; two of his books, Microgramas and País Secreto showed him endeavouring to discover the inner poetry of a typical American reality. His Canto al Puente de Oakland (1941) is a sincere homage to the greatness of the United States.

One of the high marks of 1945 Latin-American poetry

was the publication of *Poemas Intemporales* by the Colombian P. Barba Jacob.

Argentina's outstanding poetical accomplishments were those of L. Franco (Suma, 1938); S. Ocampo (Viaje Olvidado, 1949, Enumeración de la Patria, 1943); F. L. Bernárdez (Poemas de Carne y Hueso, 1943); V. Barbieri (La Columna y el Viento, 1943); González Carbalho (Orilla Nocturna, 1943). Uruguay had one more poetess of remarkable value in Sara Ibáñez (Canto, 1941). Since Spanish-American poetry had become so abundant and varied it became impossible to name all of its worthy representatives. It would also be unwise to generalize on its tendencies. It could be said, however, that abstract poetry had declined, that an eagerness to discover a new form of realism was felt in most of the younger poets. It might be true that Chile had the richest poetical production in the southern continent, but it was also true that Chilean poetry had come to a dead end and was showing alarming signs of exhaustion.

The reaction which was evidently necessary had not yet appeared.

A few words should be said about essays and plays. Spanish-American essayists were busy trying to define their world in terms of universal appeal. Few of them indulged in pure speculative work. Philosophy was studied by men like Enrique Molina (De lo Espiritual en la Vida Humana, 1938); Leopoldo Zea (El Positivismo en México, 1943); Samuel Ramos (Historia de la Filosofía en México, 1943). The field of aesthetics was studied by A. Menéndez y Samara (La Estética y su Método, 1938); C. Vaz Ferreira (Fermentario); A. Reyes (Deslinde, 1945). The majority of Spanish-American essayists dealt with historical, economic and social problems; for example, G. Arciniegas (América, Tierra Firme, 1938; Los Alemanes en la Con-

Gabriela Mistral (right), Chilean poet who was awarded the Nobel prize for literature in 1945, is shown arriving at a Fa 's airport for a vicit at the litation of the Funca government

quista de América, 1941); A. Capdevila (Las Invasiones Inglesas, 1939); A. Zum Felde (El Ocaso de la Democracia, 1939); M. Picón Salas (Cinco discursos, etc., 1940); S. Zavala (Ensayos sobre la Colonización Española en América, 1945).

The essays on literary questions were numerous, and some of them attained real success, as A. Arias' Jorge Isaacs y su "María," 1937; A. J. Bucich's Esteban Echeverria y su tiempo, 1938; A. Reyes's Mallarmé entre Nosotros. 1938; M. Vitier's Las Ideas en Cuba; P. Henríquez Ureña's La Cultura y las Letras Coloniales en Santo Domingo, 1938; Plenitud de España, 1940; J. Jimenez Rueda's Juan Ruiz de Alarcón y su tiempo, 1939; N. Pinilla's La Generación Chilena de 1842, 1943; D. Melfi's El Viaje Literario, 1945. Three histories of literature deserved mention: C. González Peña's Historia de la Literatura Mexicana (2nd ed.), 1940; Juan J. Remos' Historia de la Literatura Cubana, 1945; and A. Jiménez Pastor's Historia de la Literatura Argentina, 1945. Brief surveys were published by Mariano Latorre (La Literatura de Chile, 1943) and L. A. Sánchez (La Literatura del Perú, 1944).

Spanish-American dramatic literature had not attained great importance. Translations and Spanish plays continued to make up the repertoire of the troupes performing in Buenos Aires, Mexico or Santiago. Two organizations, however, did an excellent job in trying to create a theatre original to Latin America: the Teatro del Pueblo, organized and directed by Leonidas Barletta in Buenos Aires and the later Teatro Experimental of the University of Chile under the direction of Pedro de la Barra. The latter believed it necessary to educate the public, the actors and the authors before a worthwhile dramatic output could begin. Accordingly, he worked mostly with classical pieces of the Spanish Golden Age and occasionally produced a play by a contemporary Chilean author. Argentina had at least one original playwright in Samuel Eichelbaum (Un guapo del 900, Pájaro de Barro) and a critic in J. E. Assaf (El Teatro Argentino como Problema Nacional, 1938); Mexico had, among others, Xavier Villaurrutia (La Mujer Legitima, 1942) and Miguel N. Lira (Linda, 1942).

Spanish Civil War

The Spanish Civil War, which began on July 17–18, 1936, was an explosion brought on by deep-rooted internal conflicts. It almost immediately took on the pattern of the popular front struggle against fascism which, in turn, made it the rehearsal for World War II.

Spain, after the end of the Napoleonic period, had seen a series of military pronunciamientos ending in the dictatorship of generals who were called caudillos. There had been two civil wars in the 19th century, and the Second Republic of 1931 was brought on by a definitive revolution whose bloodshed was merely postponed. The failure of the republic to bring peace or internal stability, the reactionary period of the so-called "Black Biennium" from the end of Nov. 1931, the sanguinary, working-class uprising in the Asturias in Oct. 1934, so brutally crushed, and the constant violence all over the country reached

a preliminary climax in the elections of Feb. 16, 1936, when the popular front won.

The violence was the result and expression of many long-standing conditions—a peasantry made desperately poor by an antiquated and unequal agrarian structure, a church that was enormously rich and largely monopolized the educational system, an army that was inefficient, costly and privileged, an aristocracy and monarchy that fostered reaction. The political forces of anarcho-syndicalism, socialism, communism, republicanism, falangism and regionalism were disruptive and a constant source of conflict. From outside Spain the pressure of power politics, represented by the anti-democratic forces of Italian and German fascism, the international opposition of Russian communism to fascism and the appearement of Great Britain and France, all contributed to encouraging disruption and violence. Spain's natural riches, in which the British and French had heavy investments, and which Adolf Hitler coveted, were sources of greed.

In the elections of Feb. 1936, the popular front won a majority of seats, but the voting was close and the government formed under President Manuel Azaña was not really representative of the left and the proletarian revolutionary forces. A period of violence began, characterized by strikes, riots, mob scenes and shooting affrays, that was to merge into the Civil War. The army and Guardia Civil were undermined by subversive forces that were actively plotting rebellion. General Francisco Franco, in fact, had been demoted to the Canary Islands for disloyalty.

On July 12, 1936, Lieut. José del Castillo of the assault guards was shot down by falangists. Early the following morning, Calvo Sotelo was taken out by republicans and killed. He had supplanted José Gil Robles as head of the C.E.D.A. (Confederación Española de Derechas Autónomas) which combined most of the right political parties, and his assassination was the spark which lighted the Civil War.

The uprising was military and it aimed at a military dictatorship, but the generals soon found need for popular support and called upon falangism to provide the political framework. On the republican side, the government had failed to prepare for the shock and when it came refused to arm the people; but they rose spontaneously. The first move took place on July 17, 1936; in Spanish Morocco when a number of regiments mutinied, or rather responded to General Francisco Franco's call to arms. He had flown there the day before, finding the foreign legion, or Tercios, and the Moors ripe for trouble. The following day, garrisons rose in city after city on the peninsula at the call of rebellious generals and within 24 hours, Franco, covered by Italian and German planes, had landed and taken Algeciras and Cádiz. General Queipo de Llano, commander of the carabineros, seized strategic points in Seville and held the city until reinforcements came from Morocco in German planes.

Lineup of Power.—Although falangism was strong in Andalusia, the government held Jaén and the southeastern part of the peninsula. Galicia went to the rebels and stayed with them. In the Asturias, workers held Santander and Gijón, while Bilbao and the Basque country up to the French frontier remained loyal. Navarre, the fiercely Catholic and monarchical centre, where Carlism was still strong, became Franco's fortress and the reservoir of his best troops. It rose under General Enzilio Mola. Saragossa, although overwhelmingly left, was cowed by the military garrison under General Miguel Cabanellas. The

anarchists fought in the street, and some 1,500 were killed. Valencia and Murcia were seized by the workers and held for the government.

Everything hung upon the fate of Madrid and Barcelona. In Madrid the trade unions forced Azaña's hand. A militia rose spontaneously; barricades were thrown up, churches burned. General Joaquín Fanjúl, commander of the Montaña barracks, reacted too slowly. Militiamen surrounded the barracks and stormed them with heroism and desperation on the night and morning of July 19-20. Thus Madrid was saved for the republic and for its great siege.

Barcelona meanwhile was having its one period of high deeds, for it, too, was held for the republic by a popular, three-day uprising which called for sacrifice and courage. The anarcho-syndicalists were in their element and performed their greatest service of the war for the republic, although their activities were accompanied by a vicious reign of terror, wholesale assassinations, church burnings and the shooting of priests and nuns. The C.N.T. (Confederación Nacional de Trabajo) took power.

While Franco's army was advancing north, Mola's column coming down from Navarre was stopped at the Somosierra pass on the highway from Burgos to Madrid, and that line was held until the end of the war. The loyalists were developing the nucleus of an army in the "5th regiment," which had leaders who were later to become important—Enrique Lister, a Galician worker trained in the soviet union after the Asturias uprising, Juan Modesto, a former carpenter, Valentín Gonzalez, known as "El Campesino" and an Italian communist, Vittorio Vidali, who called himself "Carlos Contreras" and who acted as political commissar.

Initial Franco Successes; Deadlock at Madrid.—As a military insurrection, the 1ebellion had largely failed in the first week, but German and Italian arms kept it going. Four columns converged on Madrid, while a "fifth column" was supposed to be in the capital, ready to rise. The fall of Badajoz on Aug. 15 started a long series of government reverses. The slaughter by Franco's forces of 1,200 to 1,500 workers in the bull ring of Badajoz after it was taken was symbolic of the desperate and bitter character of the fighting.

Franco, who was campaigning with a small force of Moors and Tercios, aided by German and Italian tanks and planes, made a junction with his northern forces at Mérida on Aug. 16. The general soon became the acknowledged head of the insurgents, who had set up a junta at Burgos on July 22. On the government side, the conflict was accompanied by a social revolution, but unevenly and on the whole timidly. The first cabinet, under José Giral, gave way to a more radical government headed by Largo Caballero after Mola captured Irun on Sept. 4 and San Sebastian on Sept. 12, thus cutting off northern Spain from Madrid. The Italians were largely instrumental in seizing the Balearic Islands for Franco, and they made Palma de Majorca their main air base for the whole war. A front had quickly become established in Aragon and it remained unchanged for a year and a half, with Teruel and Huesca in rebel hands.

Franco diverted his troops to relieve Toledo on Sept. 27, 1936, lifting the siege of the Alcázar, he then moved on to Madrid, reaching its outskirts on Nov. 6. The government fled to Valencia on that day, leaving Gen. José Miaja at the head of a junta de defensa. For 36 hours the militia and the Madrileños, unaided, held back Franco

and his troops. The "fifth column" proved a fiction. On Nov. 8 the first Internationals entered the lines on the edge of the city at the Casa de Campo. Three days of nip-and-tuck struggle decided the issue, and there the battle lines remained until the end of the war, two and a half years later.

Laboratory for World War II.—The most decisive factor in the war, aside from intervention by Germany and Italy, was the "non-intervention" policy of the democracies, formulated and made effective by Great Britain, initiated by the France of Léon Blum's popular front and supported by the United States. Russian help for the government did not begin until late Oct. 1936, and at no time compensated for the German and Italian aid which Franco received. The League of Nations consistently followed England's lead.

The international brigades in Spain were at first composed of scattered handfuls of foreign volunteers, mostly German and Italian exiles and a few hundred French workmen. Communists soon began gathering from various countries and became the organizers and backbone of the brigades, but there was always a minority of non-party men fighting against fascism. A nucleus of high officers and technicians, partly Russian, was sent from Moscow, remaining discreetly in the background. Before the end of 1937 nearly all of them had been withdrawn. The air force at first was mainly Russian and so were the small tank units of the early months and some artillery. There was never any Russian infantry. The International commission sent by the League of Nations in the fall of 1938 gave the over-all totals as 12,673 foreigners plus 488 prisoners in all services when the internationals were withdrawn. At the beginning of the siege of Madrid, they numbered about 1,500 and at their height totalled between 17,000 and 18,000. The heterogeneous matériel they and the Spaniards used came to a considerable degree from the soviet union and was paid for in gold. The republican army was gradually conscripted, formed and trained to supplant the volunteer "columns" and party groups of the early weeks. The internationals were then incorporated into "mixed brigades," with a majority of Spanish troops.

Franco began a determined drive for Madrid on Feb. 6, 1937, by striking up the Jarama river valley, but after three weeks of desperate fighting the line was held near Arganda and remained unchanged until the end of the war. Meanwhile the Italian expeditionary force, which had won an easy victory at Málaga on Feb. 8, launched a new drive on March 8 with five purely Italian divisions. It was an attempt to smash through Guadalajara and down the plain to Madrid and it proved a turning point in the Civil War and the history of fascism, for the Italians were first held and then routed at Brihuega on March 18.

Galeazzo Ciano, Italian minister of foreign affairs, wrote after the war that his government had sent 100,000 men to Spain between mid-Dec. 1936, and mid-April 1937, without counting naval, air, tank, artillery and technical help. Numerically, the Italian contribution was always the greatest on both sides. The Germans helped Franco more than the Italians, but by means of matériel and technicians rather than men. Their Condor legion, which was formed on Nov. 6, 1936, used up between 16,000 and 18,000 men. For both Italians and Germans, the Spanish venture was considered as training.

Guadalajara changed the course of the war, as it forced Franco to give up hope of taking Madrid. On the suggestion of the Germans, the insurgents turned on the weak and isolated Basque and Asturian sectors and eliminated them. Only the Basques fought, defending their autonomy.

The campaign began on April 2, 1937. Guérnica was bombed on April 26; Bilbao fell June 19, Santander Aug. 26 and Gijón Oct. 21, when the long siege of Oviedo was raised.

The Caballero government, weakened by military reverses and by internal friction, fell on May 17, 1937. Dr. Juan Negrín became prime minister and Indalecio Prieto minister of war. In order to relieve the pressure on Bilbao, a drive was launched outside Madrid that lasted from July 5 to 24 and merely resulted in the taking, and the eventual loss, of Brunete. Another drive, toward Saragossa, which commenced on Aug. 23, resulted in the capture of Belchite by the Loyalists on Sept. 1, but otherwise was a failure. At the end of Oct. 1937, the Republican government moved from Valencia to Barcelona.

Teruel and After.-A drive by Franco on Madrid had been expected all through the autumn, but the government sprang a surprise by attacking the rebel stronghold of Teruel on Dec. 15, 1937. Surrender came, in bitter weather, in Jan. 1938. This forced the insurgents to divert their troops, but they had to make four counter-offensivesthe last Feb. 19-22, 1938. The loyalists were exhausted by the effort of hanging on, while Franco had mainly expended replaceable German and Italian matériel. He was therefore ready to strike again immediately, while the republicans were now in no condition to hold him. The generalissimo began on March 9, breaking through quickly, and commencing a drive that was to carry the insurgents through Aragon to the sea. The attack was on a 60-mile front with the major axis at Híjar. The loyalists were short of matériel and officers, and there was treachery. As the line melted, four Italian divisions, Moorish cavalry and the Spanish infantry poured through.

Barcelona was subjected to the first blitz of a great city—the prototype for those in World War II—when 18 raids were made in 44 hours during March 16, 17 and 18, 1938.

The line was first consolidated on the Segre river at Lérida, but further south the loyalists went steadily back until the Navarrese Requetés reached the sea at Viñaroz on April 15, 1938. Loyalist Spain was cut in two, but the line of the Ebro and Segre rivers still protected the north. The confident expectations of a quick victory in the insurgent camp and abroad were disappointed when Franco's most determined efforts to drive down from Teruel to Valencia were frustrated. It proved one of the fiercest battles of the war, and just as the lines were stabilized at Viver and Caudiel on July 24, the republicans again surprised the enemy by striking across the Ebro river between Flix and Miravet. The bridgehead, then set up was to take Franco four months and seven counter-offensives to reduce.

This was the last battle in which the international brigades figured, for Negrín, in a quixotic gesture, announced to the League of Nations on Sept. 21 that the Spanish government was withdrawing them. At his request the League appointed an international commission to verify the withdrawal. Benito Mussolini thereupon agreed to pull out 10,000 of the "legionnaires" who were fighting in Spain. According to Italian official figures at the time, the total number of men was 40,000, but in any event, the Germans made no withdrawals, and what counted most was the fact that German and Italian matériel continued to flow into Spain in ever greater measure. On the loyalist side, Russian help had long ceased to be of any importance. The army was wholly Spanish. The matériel bought from the soviet union or "bootlegged"

from various countries, could not get into Spain because the French held it at their ports until too late, and the German and Italian naval units at Franco's disposal made direct shipments risky. Thus the republicans had to fight their hopeless struggle alone.

Loyalist Collapse.-The consequences of the Ebro attack proved the same as at Teruel. The battle also ended with the loyalist army exhausted and without matériel, while the insurgents had received the heaviest reinforcements of matériel in the whole war. The Italian "Corpo Truppe Voluntarie" was reorganized and re-equipped under General Gastone Gambara and from then on fought hard and effectively. After five weeks of sporadic bombing raids on rearguard towns, Franco struck on Dec. 23, 1938, across the Segre river on three sectors. The Italians found an opening near a small insurgent bridgehead at Seros and poured through. Moorish cavalry followed and began a sweep around their right wing against feeble opposition by the loyalist 43rd division, but at other points the defense was heroic. Lister, who had become the greatest of the loyalist commanders, held the Italians for ten days, while Lieut. Col. Francisco ("Paco") Galán fought a stubborn retreat in the Tremp sector for as many days. But on Jan. 4, 1939, Borjas Blancas and Artesa de Segre were lost, and with them the Civil War. Franco by then had 28 divisions in the line and overwhelming matériel superiority of every kind. The loyalists did not even have nearly enough rifles to go around. The diversion that should have come from the southern zone never materialized, for its people were tired and its higher officers weak or treacherous.

Tarragona fell on Jan. 15 and after a brief pause the insurgents drove steadily toward Barcelona. The Catalan capital was not defended and was lost on Jan. 26 after having been subjected to five days of almost uninterrupted bombing. A few days before, the government moved to Figueras where the last dramatic cortes of the Second Spanish Republic gathered on Feb. 1, in the cellars of the castle overlooking the town. It was an effort to maintain constitutional legality, and the cortes had, indeed, met regularly every six months during the war, wherever possible.

The retreat, which was accompanied by more than 250,000 civilians, began to push up and then over the French frontier. Men, women, children and soldiers were packed into hastily improvised camps where most of them remained for months and years. Figueras was overrun on Feb. 8 and the government came across to the Spanish portion of Le Perthus the next day. The republican army went on fighting rearguard actions as best it could to the very end, and it succeeded at least in delaying the insurgents long enough to protect the civilian refugees and to save what matériel it had. By the afternoon of Feb. 10, 1939, Generalissimo Franco's forces were all along the whole French frontier.

All that remained was to liquidate the southern zone, where Madrid still continued its heroic defense. Dr. Negrín and a few faithful adherents, including Lister and Modesto, flew into the zone in an effort to rally the 60 divisions which were there. A much greater war was approaching and they saw that if the zone could hold out for six months or more, the democracies would have to come to the rescue. However, the forces in Madrid, nominally headed by Gen. Miaja, but really controlled by a former regular army officer, Col. Sigismundo Casado, were placed at the mercy of Franco. Parleys were held in which the generalissimo insisted on unconditional surrender. To accomplish this it was necessary to liquidate the loyal ele-

ments and this was done by inducing the anarchists and some other troops to turn on the communists and those men who wanted to fight to the end. The navy mutinied and sailed to Oran; Negrín and his followers had to fly to France, and there was nothing to stop the insurgents from entering the capital. The epic siege of Madrid ended on March 29, 1939. That same evening the Navarrese corps, followed by the Italians who had driven down to the coast without opposition, entered Valencia unopposed. Resistance had ended everywhere. Minorca, the only territory outside of the peninsula which the government had held on to, had already been turned over to Franco by the British. The Civil War was over. (See also International Law.)

Spanish Colonial Empire

The Spanish empire at the end of the decade 1937-46 comprised territory in Morocco, the western Sahara and Spanish Guinea. In Morocco, Ceuta Melilla, Alhucemas, Chafarines and Peñon Veliz; area 82 sq.mi.; pop. (est. 1944) 145,000; capital: Madrid (administered as part of Spain). Spanish Morocco; area 8,080 sq.mi.; pop. (1944 est.) 992,000; capital: Tetuan (protectorate). Spanish

Guinea, including Fernando Poo, Rio Muni and 4 small islands; area 10,900 sq.mi.; pop. (1944 est.) 168,000; capital: Santa Isabel (colony). Western Sahara, including Ifni and Spanish Sahara; area 116,200 sq.mi.; pop. (1944 est.) 72,000; capital: Villa Cisneros (colonies).

Total area: c. 135,200 sq.mi.; total pop. (1944 est.) 1,377,000.

Tangier (q.v.) was temporarily incorporated into the empire.

During the greater part of the Spanish Civil War (1936–39), the colonies were held by Gen. Francisco Franco.

In Jan. 1937 the French government protested against the alleged infiltration into Spanish Morocco of German troops and the development of German military and commercial interests, including the building of barracks for a German armed force. Hitler replied, however, that Germany had no designs there. From Morocco Gen. Franco poured large num-

beis of Moorish troops into Spain, describing them (March 13, 1938) as "the flower of the army" and used them freely, notably in the capture of Santander (Aug. 26, 1937), Lérida (April 3, 1938) and Castellón (June 14, 1938).

The Republicans repeatedly bombed Ceuta.

In his first cabinet (Jan. 30, 1938) Gen. Franco assigned the government of the colonies to his vice-president, whence it passed to the foreign ministry, but on Jan. 23, 1942, it was made over to a directorate-general, responsible to the head of the state.

The first director-general was Don Juan Fontán, previously governor-general of the Spanish possessions in the Gulf of Guinea.

The principal high commissioners for Spanish Morocco were Col. Juan Beigbeder (later Spanish foreign minister), Gen. Carlos Asensio, Gen. Luis Orgaz and Gen. José Varela.

From the beginning of the Civil War, Tangier was a centre of discord, owing to its important position on the Straits of Gibraltar. Italy, e.g., accused French magistrates of partiality in an inquiry into a dispute between Italian soldiers and Spanish communists, while Franco accused Italy and Germany of making unscrupulous use of propaganda in order to detach the people of Tangier from allegiance to their ruler and thus threatening the unity of Morocco.

But only during World War II was the international status of Tangier temporarily changed. During 1943–45 it became a part of the Spanish colonial empire. (See Tangier.)

On the British-American invasion of North Africa (Nov. 8, 1942), the two governments sent Spain a written assurance that "Spanish territory will be fully respected and Spanish interests in North Africa will not be compromised," which Spain "gratefully accepted." Gen. Miguel Yagüe, an old and tried soldier, was appointed to the command of Spanish Morocco, but no other steps were taken.

Spanish Literature

Spain's Civil War, a sort of preview of World War II, broke out on July 18, 1936, leaving in its wake devastation, death, starvation, concentration camps, mass emigration and complete disruption of normal life. With the cessation of open warfare (1939) and the establishment of Francisco Franco's government, there was instituted a strict censorship which stifled effectively all liberal tendencies.

The gloomy war years claimed in death several notable writers. In 1938 the idealist Armando Palacio Valdés, esteemed as a gentle grandfather by the younger generation of novelists, slipped away from this life, his passing being hardly noticed during the siege of Madrid. Antonio Machado died in 1939 at Collioure in the south of France; his death resulted directly from privations suffered while escaping from Barcelona. The same year also saw the passing of Serafín Alvarez Quintero, elder of the two brothers who collaborated in writing more than 200 plays, many quite remarkable for their sprightly humour and springlike freshness, particularly conspicuous in those having their setting in Andalusia.

The Civil War furnished the topic for many books of the decade 1937–46, a number characterized by inadequate assimilation of the material to the literary form. The drama and the novel deteriorated noticeably in quality; of true novels there were few. Several émigrés won distinction through writing frank, critical, philosophical prose. The nationalists controlling Spain's destiny insisted upon preserving peninsular tradition and indigenous culture, importing nothing from the other European countries or the Americas. The most important propagandist of this doctrine was the essayist Ernesto Giménez Caballero.

The indefatigable Pío Baroja, creator of some 70-odd volumes, continued producing books, few of which, if any, served to enhance the author's reputation. He persisted in his pessimistic views and grumbled about practically everything and everybody, retaining his stubborn genuineness. In his supposed novels the action developed in an endless swift succession of incidents and characters, both equally deficient in imagination and dramatization. His style still possessed a journalistic flavour, characterized by pellucid directness. In Rapsodias, a collection of essays on divers literary and social themes, special interest attached to Baroja's speech delivered upon his reception in the Spanish academy. Intentionally, the author plays the part of a writer of the streets, the autobiographical information being recounted with the utmost candour. El cura de Monleon, the second volume of the trilogy La juventud perdida, is the story of a truly Barojan hero, who discovers in the end his incompatibility with his spiritual vows. Historias lejanas contains three fairly long stories

and ten miscellaneous articles previously published in newspapers. El caballero de Erláiz awakens interest with its adventures in the French and Spanish Basque countries during the French Revolution. Three volumes of memoirs (El escritor según él y según los críticos; Familia, infancia y juventud; El Final del siglo XIX y principios del XX) relate his autobiography in fragments, boring in spots because of too many details. He sometimes gives expression to petty dislikes, speaking in a harping way of his contemporaries, both the living and the dead. His description of the dissecting room leaves a thoroughly disagreeable impression, yet his concrete realism gives way in a few places to lyricism.

José Martínez Ruiz (Azorín), awarded the Gran Cruz de Alfonso el Sabio, rivalled Baroja in his productivity. He published in 1941 two volumes of autobiographical memoirs, Valencia and Madrid. The 40 chapters of El escritor may be looked upon as interesting chats expressed in a language personal and simple, yet very beautiful. Tiempos y cosas, composed of 32 articles not previously assembled in book form, is concerned primarily with topics of artistic and literary criticism. The novel Maria Fontán analyzes the reactions of an opulent heiress, curious and restless. Salvadora de Olbena, another novel, likewise presents an exceptional woman character against the background of a small provincial city. El paisaje de España visto por los españoles is a study of Spanish landscapes through the works of authors who had best described them. Veraneo sentimental gives travel impressions of well-known summer resorts. Paris is made up of essays about the French capital. Still another book of essays, previously published in Spanish and Spanish-American newspapers, was Palabras al viento.

Salvador de Madariaga, professor, literary critic, essayist, high functionary of the defunct League of Nations, former ambassador and minister of the republic, continued to cultivate several literary genres. His Campos eliseos is a purported dialogue in which Goethe, Mary Stuart, Voltaire, Napoleon, Karl Marx, and President Washington discourse on 20th-century conditions: fascism and communism, the evil effects of moving pictures, the U.S. reluctance to join the League of Nations, etc. The novel El enemigo de Dios has for its protagonist a hunchback through whose eyes life takes on a different point of view. Later Madariaga devoted his attention almost exclusively to biography. His comprehensive life of Christopher Columbus, although replete with documental notes, bibliography and two indices, is never dull in spite of its erudition; one of the most interesting chapters takes up the oft-debated question of the great navigator's origin. Similarities between Columbus and Don Quixote are developed as the hero's life unfolds. Madariaga's biography of Hernán Cortés, equally well documented and packed with details, is a fascinating story of a real life, not just a record of historical events.

El Gran Hotel and Los muertos, las muertas y otras fantasmagorías possess the good humour and optimism for which Ramón Gómez de la Serna's works had become so well-known. El circo, in addition to its many ingenious digressions inspired by the circus, contains some biographical data by the author's brother, Julio Gómez de la Serna. Lo cursi y otros ensayos are full of epigrams and paradoxes. While manifesting sympathy for modern poetry and surrealism, the essayist makes use of the opportunity to condemn the submersion of literature in politics.

Ramón J. Sender, an active combatant, suffered much in the Civil War, several members of his family being executed by the fascists. Sacrifice and marked idealism endowed him with a deep humanitarian spirit. All of his works are arresting narratives. Proverbio de la muerte, of an autobiographical nature, is the author's account of his crossing to Mexico. The novel presents a disillusioned idealist who wins his battle in the determination to live. El lugar del hombre turns back the pages of time to prewar Spain, the Spanish countryside becoming a symbol of this modern world; this novel studies man's injustice and inhumanity toward his fellow. Hernán Cortés, written in dialogue form, draws excellent sketches of Mexico's conqueror, a complex character generally misunderstood; Marina, his quenda and interpreter; and Xhinotecatl, the untamable young Indian leader. Novelettes, legends and animal stories form Mexicayotl, a panorama of ancient Mexico. The plots are closely linked with that country's salient natural features, birds and animals. Epitalamio del Prieto Trinidad is a sombre picture of the tortured world and its monstrous inhabitants. The tender love story of Darío and La Niña-Truth and Beauty-flowers in the unhealthy atmosphere of an island penal colony. The author termed this psychological novel "a poem of the subconscious." In Crónica del alba, Sender returned to the Aragón of his childhood; it is a beautiful tale of family life, youthful love, adventures in an abandoned castle, studies and boyish pranks.

Jacinto Benavente, Spain's most distinguished dramatist and Nobel prize winner in 1922, continued writing plays. His later works were: La culpa es tuya; La enlutada; El demonio del teatro; La honradez de la cerradura; Al fin, mujer; and Nieve en mayo. In 1945, while in Argentina to see to the publication of his memoirs, he was lionized at numerous literary gatherings and made corresponding member of the Argentine academy of letters. He had, moreover, the satisfaction of seeing staged in Buenos Aires his famous masterpiece, Los intereses creados. In Jan. 1941 Don Joaquín Alvarez Quintero, the surviving member of the distinguished pair of brother-dramatists, received appointment as bibliotecario perpetuo of the Spanish academy. The facile playwright Carlos Arniches Barrera produced comedies, farces and tragedies right up to the end of his life: La venganza de la Petra, o donde las dan, las toman; ¡La condesa está triste!; La fiera dormida; Ya conoces a Paquita; Don Verdades. El galeón y et milagro, Eduardo Marquina's drama in verse, was lavishly produced in 1945. Another of his later works, Maria la viuda, glorifies religion and mother love. Ignacio Luca de Tena, one of the most popular playwrights of the latter part of the decade, dramatized Juan Alarcón's humorous novel El sombrero de tres picos. The talented poet Rafael Alberti, a refugee residing in Argentina, wrote an eccentric play El adefesio, with the subtitle Fábula del amor y las viejas, in which three old spinsters oppose a young girl's love, thereby causing her suicide. The famous actress Margarita Xirgu took the leading role at its premiere in Buenos Aires. The modernist poet Manuel Machado revealed traditional Spanish faith in El Pilar de la Victoria, a lyric religious poem, with music by Pablo Luna and Julio Gómez, which had its initial performance in Zaragoza during the Pilar festival of 1944.

Among the older poets who remained in Spain, two wrote deeply religious works, strikingly different from what came before from their pens. Vicente Aleixandre, stricken by illness and living in retirement, ceased to be essentially a love poet. The poems of Sombra del paraiso presented a new perspective, expressed in elaborate symbolism tending to the baroque. Passion for the sea is evident in this poetry, often cast in a form of exquisite plastic grace. Dámaso Alonso's Hijos de la ira, free from the spirit of

aloofness prevailing in his earlier poems, is as the subtitle indicates a "diario íntimo." The verses evoke the problem of man's relation to God and disclose concern over ultimate values. Several excellent studies added lustre to Dámaso Alonso's fame as an erudite critic and scholar, properly recognized in his appointment to membership of the Academia de la Lengua in May 1945. La poesia de San Juan de la Cruz shows the great mystic's indebtedness to Garcilaso and Garcilaso a lo divino (an adaption by Sebastián de Córdoba, who gave to Garcilaso's works a spiritual significance), the elements stemming from popular tradition and the biblical roots. Dámaso Alonso's Ensayos sobre poesía española consists of some thoughtprovoking chapters relative to both the old and new in Spanish poetry. Such dissimilar topics as The Poem of the Cid, sonnets attributed to Francisco Gómez de Quevedo, Gustavo Bécquer's originality, García Lorca as an expression of the Spanish spirit and Aleixandre's poetry are discussed in a stimulating manner. Versos plurimembres y poemas correlativos studies in detail the multipartite and correlative verses written during the "Golden Age"; the critic is not a biased partisan of Gongorism.

The poet Pedro Salinas, who became a professor at Johns Hopkins university, Baltimore, Md., published two books of a critical nature. Reality and the Poet in Spanish Poetry is made up of six lectures which attempt to bring together around a common thematic centre-reality and poetry-a series of spiritual reactions experienced in reading The Poem of the Cid, Jorge Manrique, Calderón de la Barca, Garcilaso de la Vega, Fray Luis de León, San Juan de la Cruz, Luis de Góngora and Jose de Espronceda. His volume Literatura española, siglo XX, divided into three sections, opens with a discussion of modernism, the generation of '98 and 20th-century literature before taking up Miguel de Unamuno, Ramón del Valle-Inclán, Antonio Machado, Jorge Guillén, García Lorca, Luis Cernuda, etc. He finds the period characterized by a lyricism, evident not only in poets but in prose writers like Unamuno, Pérez de Ayala, Azorín and even Baroja. Juan Ramón Jiménez, still Spain's greatest poet at the end of the decade, also assembled in Españoles de tres mundos a number of brief impressionistic sketches-by no means traditional-about Bécquer, Rosalía de Castro, Asunción Silva, Salinas, Dámaso Alonso, Guillén, Pablo Neruda, etc.

Spain could well be proud of the accomplishments of the young literary historian and critic Angel Valbuena Prat. His Historia de la literatura española, in two volumes, was the best book of its sort to be published in a number of years. It was the product of deep study and an incredible amount of reading. The last chapters, concerned with contemporary letters, are extremely important because of an acute discriminating taste between what is good and bad. In La novela picaresca española, the most complete collection of Spanish picaresque novels in one volume, Valbuena Prat discussed the genre in its satirical and social phases along with the derivation of the word picaro. Brief introductions precede each of the novels. His Teatro moderno español is a critical examination of the theatre from the beginning of the 18th century. Three volumes of the all-comprehensive Historia de España, directed by the famous philologist Ramón Menéndez Pidal, and numbering among its contributors historians of authority, were published. Rodríguez Marín brought out another volume of proverbs, Todavia 10.700 refranes más.

The cultural life in Hispanic America was greatly quick-

ened by the many Spanish refugees who fled there from Europe after the fall of the republic Mexico absorbed as many of these intellectuals as all of the other Latin Amer ican countries combined Enrique Diez Canedo, author lecturer, editor and dramatic critic wrote several works of literary criticism while teaching in the Mexican capital before his death El teatro y sus enemigos studies the three enemies which had brought about the decline of the theatre the 'movies' the actor and the author Juan Ramon Jimenez en su obia is an examination of this poet s development, his indebtedness to others and influence on the younger generation Letras de America treats literary figures belonging to practically every age and nation of Latin America Diez Canedo's little book of epigrams con tains fleeting impressions experienced while journeying through South America the orient and Mexico

Jose Moreno Villa archivist, poet, essayist and painter also worked in Mexico City. In Locos, enanos, negros y niños palaciegos he brought to light a lot of curious information relative to the entertainers in the Spanish court from 1563–1700. Cornucopia de Mexico gives sensitive im pressions of the habits language and folklore of his new homeland. His unconventional autobiography Vida en claro holds the reader's attention with its modernist verses the reproduction of the author's paintings and the account of life in the Residencia de Estudiantes in Madrid with glimpses of Garcia Lorca and others

The Valencian journalist, playwright poet and lecturer Max Aub, wrote prolifically in the favourable surroundings of the Mexican republic Morir por cerrar los ojos is a tragedy dealing with the collapse of France, the material 1sm and selfishness of its citizens, their barbarous treatment of foreigners and the officials' propensity for bribery His Diario de Djelfa, poems composed in Africa in a French concentration camp for interned Republicans, expresses the prisoners' feelings of despair and hope, together with an account of their physical sufferings caused by cold hunger and ever present death No son cuentos, eight sketches written in different countries and over a period covering some six years, are records of actual experiences in the Spanish Civil War, related in short story form The first story makes a deep impression with its portrait of the enslaved sharecropper converted into a patriot through receiving some land to cultivate as his own. Too, there are spiritual tragedies like the one of the turncoat priest

Jose Bergamin, a great essayist, established in Mexico City a thriving publishing house the Editorial Séneca. In spite of his many duties connected with this company Bergamin found time to write articles, essays, plays, novels and ballets. His incisive style, one of the most individual in modern Spanish literature, is characterized by the use of metaphors, epigrams and aphorisms. This author is first of all a psychologist and social philosopher. His Detras de la cruz, with the subtitle Terrorismo y perse cucion religiosa en España, treats of collusion between the Spanish church and fascist Italy and nazi Germany during the Civil War.

Only the future could show whether peninsular Spanish letters would again attain the world importance enjoyed by the generation of 1898 Barriers along the way to impede the realization of such a goal were strict censorship internal dissension, chronic lethargy and the loss of numerous writers—some of high calibre—who would most likely pass the remainder of their lives in the Americas

Special Areas, British

The term special areas was first used in Britain in the Special Areas (Development and Improvement) act 1934 which provided for the establishment of two com missioners, one for England and Wales and one for Scot land whose functions were 'the initiation, organization, prosecution and assistance of measures designed to facili tate the economic development and social improvement' of the special areas. These areas depended on coal min ing and heavy engineering industries. Their special prob lem was prolonged and intensive unemployment. In 1937 the powers of the commissioners were extended by the Special Areas (Amendment) act, which enabled them to make a financial contribution not only in relief of income tax and rates but also towards rent payable in respect of new industrial undertakings and for certain street works and field drainage works

During World War II prosperity came to the special areas and unemployment dwindled to a vanishing point Schemes not under construction, which the commissioners had undertaken to assist, were postponed. Those begun were, wherever possible, completed Towards the end of the war the government began to look ahead to the post war problems of the special areas. The 1934 and 1937 acts were repealed, and the Distribution of Industry act, 1945 was substituted This later act set out new procedures for stimulating the industrial and social development of areas in which there was a special danger of a recurrence of unemployment The special areas now became known as development areas," and the board of trade took over the functions of the commissioners Provision was made for adding to the list of development areas by order of the board of trade

To the four areas determined before World War II (South Wales and Monmouthshire, North Eastern area Scottish development area and West Cumberland development area) the South Lancashire and Wrexham areas were added in 1945, by order of the board of trade

Spellman, Francis Joseph

Cardinal Spellman (1889—), U.S. Catholic prelate, was born May 4, 1889, in Whitman, Mass. Ordained in Rome in 1916, he served as assistant chancellor of the archdiocese of Boston, Mass., 1922–25, and in the latter year became the first U.S. priest to enter active service in the papal diplomatic corps, serving in the papal secretariat of state in the Vatican. In 1932 he was appointed titular bishop of Sila, to serve as auxiliary bishop of Boston, and on May 23, 1939, he was installed as the sixth ordinary of the New York archdiocese.

Three months after the outbreak of World War II, he was appointed by the holy see to be U.S. military vicar. In this capacity he journeyed over the world for inspections of military installations and conferences with churchmen; he also met U.S. fighting men in the field.

The archbishop frequently pleaded for tolerance as "the basic American credo of religious, industrial education and social freedom." In 1945 the cardinal served as secretary of the administrative board of the National Catholic Welfare conference in Washington, D.C. Announcement of his appointment to the Sacred College of Cardinals was made Dec. 23, 1945, and he was created cardinal on Feb. 18, 1946.

Spices

As 1937 opened, the U.S. Food and Drug act was 30 years old. On June 25, 1936, the original law of 1906 had been repealed and replaced by the U.S. Food, Drug and Cosmetic act with added police power over imports and interstate shipments of spices. Consumers became more conscious of flavour and strength and the eupeptic qualities of spices. The staple spices were 24 in number, the same as centuries before.

Mustard.—In the western hemisphere and Europe, more mustard was eaten during the decade 1937-46 than any other spice. In large measure this was due to the activity of U.S. and Canadian farmers. They were ready when World War II began, and their crops maintained adequate supplies of mustard seed from Montana, Washington, California in the United States and Alberta in Canada. The U.S. harvest of 1946 was estimated by the department of agriculture at 49,490,000 lbs. Until 1936, nearly all mustards had originated in Europe and Asia. Imports into the United States were impossible during the war, as governments refused to issue export permits. U.S. growers were protected by the 1939 reciprocal import duty of one and three-quarters cents per pound (about 16% ad valorem). The ascending popularity of salad dressings and mayonnaise explained the heavier demand. New homogenizing methods for combining oils with mustard and the other ingredients and better retail distributing methods, plus the vogue of raw, leafy vegetables, indicated still more expansion. The finest seeds continued to come from England. The three varieties cultivated during the decade in North America were yellow (Brassica alba), brown (B. nigra) and oriental (B. juncea). England, Denmark and Sweden resumed shipments in March 1946. The Netherlands again appeared as a seller to offer its new crop mustard for shipment in Oct. 1946.

Black and White Peppers.-Trading in peppers was

turbulent throughout the decade. About 1934, the suggestion that pepper was a good hedge against inflation had been widely accepted. Pepper trading began on the New York produce exchange, which began to displace London as the world market, and margin and cash business became active. In 1939, several bumper crops depressed spot and future quotations from the six cent low of 1936 to a new low of two and three-quarters cents per lb. ex store New York (50 year average 13.6 cents). Accumulation was brisk, hastened by the diminishing gold content of the dollar. Warehoused tonnage rapidly increased. The produce exchange reported stored stocks in bags (140 lbs. each) every month. When the Office of Price Administration established price controls in 1941, it imposed a ceiling of six and three-quarters cents per lb. at which some "fright selling" occurred. A few months later the OPA reduced the ceiling to six and one-half cents, which just about ended pepper selling. As Japan invaded the Netherlands Indies and French Indo-China, where most of the world's pepper originated, imports ceased. Southwestern India became the sole source of supply; there the price was much higher than the U.S. ceiling, hence the later U.S. scarcity. Because of the need of the U.S. armed forces, the U.S. government moved to seize stored stocks at six and one-half cents (world price 18 cents), but desisted when court action seemed inevitable. OPA countered later by raising the ceiling to ten cents (world price 20 cents), when a few tons came on the market. A real pepper famine impended. From July 1, 1945, to Sept. 1, 1946, New York stocks had dropped from 58,832 bags to 7,901 bags. The impasse continued because of the impossibility of importing at the U.S. ten cent ceiling. The OPA feebly tried again by raising the ceiling to 15 cents per lb., and some sellers appeared. But replenishment from Alleppey and Tellicherry (Indian pepper ports) could not be landed in New York for less than 251/2 cents.

Pepper had been plentiful and the price much below normal in 1934. There was no U.S. import duty on it; kept dry, pepper does not deteriorate and there had always been a market for it, either domestic or export, usually both. Demand had been universal. Pepper, therefore, was an excellent hedge against losses from currency depreciation, and investors switched wealth into it from securities, thus increasing the stock pile to 673,527 bags (42,100 tons) in New York warehouses by April 1939. That amount was sufficient for the United States for 31/2 years; the normal consumption of 1,000 tons per month was later reduced to 250 tons by a regulation limiting distribution to 25% of the prewar normal. The plowing-under of crops and slaying of little pigs in exchange for largess were recalled as the proponents of those policies, still in power, found profits on warehoused pepper abhorrent. whether from domestic or export sales. The U.S. per capita pepper expenditure was less than 15 cents per year.

When OPA ceased temporarily to exist on June 30, 1946, active trading in pepper was resumed, and much spot tonnage changed hands at from 25 cents to 60 cents. The volume faded to nothing flat when OPA was revived July 25 and reimposed the ceiling price of 15 cents. The pepper ceiling was removed at last on Aug. 26, 1946 (world market 55 cents).

Cinnamon and Cassia.—These two spices are one and the same to consumers north of the Rio Grande. Elsewhere they are marketed under their distinctive names. The world's supply of cinnamon comes from Ceylon. Its soft, smooth, mild flavour and light colour pleases Latin

Americans. About 90% of the production ordinarily had been bought by them at prices usually much above the cost of cassia. During World War II, cinnamon was eagerly accepted as a substitute in the United States, but cassia remained the favourite. The supply from Sumatra and other East Indian islands was cut off during the war. China remained the largest producer of cassia; its best variety, Saigon cassia, remained expensive as it carried the largest percentage of the essential oil conveying flavour and strength. During 1936-37 the results of many years of effort to improve quality were noted. Certain almost tasteless varieties of cassia were excluded from U.S. markets under the National Food law as trash. During the period 1941-46 the distribution of cassia and cinnamon in the United States was limited to 25% of the prewar volume, and price was controlled by ceilings. Early in 1946, exports of fine varieties from Hong Kong were resumed, including the strongest and best flavoured Saigon variety.

Ginger.—Ginger, next in popularity, was shipped in usual volume throughout the decade 1937–46. While World War II continued, imports from Sierre Leone, West Africa—supplier of the staple variety for cakes and gingersnaps—were several times delayed; but the cochin from southern India, with its lemony flavour (for ginger wafers) was plentiful. The top U.S. favourite for lightness of colour and rich fruity flavour, produced in Jamaica, was always in good supply for ginger ale, fancy baking and the tonic purposes set forth in the U.S. *Pharmacopoeia*, 12th revision.

Cloves.—Cloves remained continually available despite the war and reduced shipping service. The two islands, Zanzibar and Pemba, sent all that was needed. Quickly following the fall of Japan, Madagascar again contributed to the clove supply. The production of vanillin from oil of cloves was expanded; this synthetic vanilla was needed in unprecedented volume by Allied armed forces. As flavouring in powder form, it required neither alcohol nor heavy bottles, both scarce during World War II.

Pimento.—The prime mincemeat spice remained known throughout the United States as allspice, because in flavour it resembles a mixture of cinnamon, cloves and nutmegs. Botanically it is Pimenta officinalis, a tree, native to the island of Jamaica, British West Indies, which continued to be the only successful producer. During the decade, a rival appeared on the market, listed by botanists as Eugenia Tabasca from Mexico, whose fruit also is baccate, same size and shade of brown as the true allspice. Because of a strong fragrance resembling bay rum, it remained unpopular in foods and hence became marketable only when its price was cheaper than the Jamaican product. Authorities administering the U.S. food law required it to be labelled Mexican allspice to prevent deception of buyers seeking Jamaica allspice or pimento.

Nutneg and Mace.—During the decade 1937–46 production in Grenada, a British West Indian Island, increased. This was fortunate, as World War II had eliminated Banda, Siau and other nutmeg islands of the Netherlands Indies as suppliers, leaving Grenada as the only source of nutmegs and mace after 1941. From a peacetime price of ten cents, nutmeg value increased to 70 cents per lb. The Indonesian rebellion continued the Grenada monopoly. Fried cakes or crullers were unusually popular during 1937–46; to maintain consumer acceptance, these had to be flavoured with nutmegs.

Red Pepper and Paprika.—Korea, Japan and Manchuria, which had shipped most of the U.S. tonnage of these spices, dropped from the market when fighting began in the Pacific; by late 1946 they had not yet resumed exports. India, a one-time source, cultivated more staple foods. A few were obtained from Mexico, but shipments often were excluded from the U.S. market by food law restrictions against a mould growth within the pods. Arizona and California began to ship larger quantities. The sweet paprika was in continuous good supply. When Hungary was invaded, competition for the world's paprika orders diminished. Spain and Portugal were quick to raise prices about 50%. Supply was well maintained as high prices abetted production, and quality was excellent. On the U.S. family table paprika became more prominent; as late as 1937 it had been found almost exclusively in public eating places.

Cayenne.—The most pungent of all spices (also as capsicum—a useful drug) was insufficiently available during World War II. Produced in both East and West Africa near the equator, it became difficult to ship as naval operations increased. Simultaneously with the extreme scarcity, the U.S. food law administration found new reasons for excluding importations.

Herbs.—For many years the United States used the thyme, marjoram, savoury and basil grown in France. They were missed during World War II, and, as usual, substitutes appeared. Unsuspected quantities of thyme—not the same as the French product—were found in Spain. Marjoram also grew in Chile, which shipped many tons. Portugal had savoury and bay leaves (Laurus nobilis); the latter in prewar times was almost a Greek monopoly, so excellent

A cutting of dried sweet basil being stacked on a farm in Los Angeles, Calif., in 1942

was the flavour and colour of the latter nation's product. Shippers in Athens wrote happily of the 1946 laurel crop, explaining that no leaves had been gathered for five years, hence trees were "strong" and leaves brighter and more flavourful.

The important herb for pork sausages is true sage (Salvia officinalis), whose wartime substitutes in the United States were disappointing. Because of the popularity of pork products, U.S. per capita use of sage became the world's highest. It was needed too in most dressings for poultry. Some was grown in the northwestern United States, but production costs (mostly hand labour) made the price six times higher than that shipped from the Adriatic port of Dubrovnik. Various makeshifts from Mediterranean islands and Spain were tolerated, but none were genuine sage. Their common defect was a camphorlike flavour.

Chili.-When General John J. Pershing crossed the Rio Grande, his troops learned to eat chili con carne (chili with meat). This national dish of Mexico depended upon the chiles anchos, a variety of red peppers distinctive in character and not too "hot." Its carminative quality, rugged flavour and deep red colour were advantageous in breaking the monotony of roasts and fried dishes. The spice industry quickly responded with chili powder, 85% of which, under the food law of 1938, had to be chili. The popular brands after 1936 contained the genuine ancho. Some highly pungent cayennes, popular south of Texas, were omitted in U.S. formulae. The popularity of Mexican chili touched a new high during the decade 1937-46. Work on flavour combinations of spices continued during the decade. Two prominent and long-standing accomplishments in this line were curry powder and the pickling mixtures of whole spices. (C. A. T.)

Sports

The decade of 1937-46 showed with definite clarity how a world war could affect the wide field of sports, amateur and professional. On the sports field the previous decade came to a close with the holding of the Olympic games of 1936 in Berlin in a setting of unprecedented sporting splendour-with a baleful background. Under the personal attention of Adolf Hitler and for the general purposes of nazi propaganda, the Germans in control of the international sports program provided stadiums, playing surfaces, indoor courts and outdoor courses and all equipment for the comfort and convenience of athletes and spectators to an extent never before approached in the 40-year span of modern Olympic competition. There were 5,000 athletes representing 55 different nations in the Berlin games. The main stadium was filled to its capacity of 110,000 spectators every day and sometimes twice a day while the Olympic festivities were afoot. Estimates of the cost of production and operation of the Berlin games ran as high as \$80,000,000, but even a quarter of that sum would have been a new Olympic record.

But for all the magnificent setting, the great gathering of athletes from all over the world, the astonishing hordes of spectators at the various events and the record-breaking competition on the fields of action, many visitors from other nations viewed the Berlin games in a brooding spirit. It was 1936. By that time Japan had walked into Manchuria and out of the League of Nations. Italy already had swallowed Ethiopia and Benito Mussolini was bellowing for more from assorted balconies in Rome. Austria was seething with internal dissension. France was torn by political strile and Paris had seen rioting in the streets and deaths by shooting on the Rue Royale. Worst of all, Hitler's war machine was in the making and there were signs of it on all sides of the Olympic games at Berlin in 1936. So the Olympic spectacle was watched by visitors with mental reservations; there was more in it than met the eye, and more behind it than the "Strength through Joy" that the nazis had been chanting. At the end of the games the visiting athletes and their camp followers scattered with a vague feeling of dread. Something was in the wind and behind the glittering trappings at Berlin. What was in the wind and behind the glittering trappings, of course, was World War II and misery and mourning for millions all over the globe.

But sports ran their merry way along the edge of the abyss for a few more years. France had its annual quota of hysteria over horse racing, bicycle riding and soccer football in 1937. In Great Britain there was the usual round of cricket, football, golf, tennis, horse racing and all the rest of it. John Bull trotted out a thin little chap named Sydney Wooderson, who ran a mile outdoors in 4:06.4, a new record for the event. T. O. M. Sopwith, for the honour of British yachting, made his second challenge for the America's cup with his "Endeavour II" and according to the custom, was beaten back by the U.S. defender, "Ranger," off Newport, R.I. In 1937 the New York Yankees were pounding ahead toward an overpowering record in baseball, and it was in this same year that Joe Louis, the outstanding pugilistic star of a war-torn decade, climbed to the heavyweight boxing throne over the fallen body of James J. Braddock, whom he knocked flat and senseless in the eighth round of their championship bout in Chicago.

War clouds were gathering on the horizon in 1938, but the horizon seemed comfortably distant to most of the players and spectators on and around the fields of sport. There was a successful racing season in France and the British, for the first time, deleated the United States team in Walker cup golf. Scabiscuit won the triple crown of the U.S. turf and Don Budge, at the peak of his redheaded career on the tennis courts of the world, won the British, French, Australian and United States singles championships, a quadrilateral triumph to rival the "grand slam" of Bobby Jones on the golf links in 1930. It was quite a year for sports in the United States. The Yankees again were unbeatable in baseball. Football was played before record crowds. Basketball was gaining ground rapidly as a public spectacle in the indoor season and, outdoors, winter sports were winning converts with each successive cold spell. There were ski tracks on a thousand snow-covered hills of the northern sector of the United States and Canada, and Sonja Henie drew 102,000 spectators to six performances of her ice show at Madison Square Garden. There was one ominous happening, however, in the field of sports. The Olympic games of 1940 had been assigned to Tokyo. Embroiled with many nations and pushing relentlessly

deeper into Chinese territory week by week, it was in 1938 that Japan formally abandoned plans to hold the Olympic games of 1940 at Tokyo. Finland, a small country with a great record of Olympic competition, eagerly applied for the privilege of holding the games that the Japs had abandoned, and the Olympic games of 1940 were transferred to Helsinki.

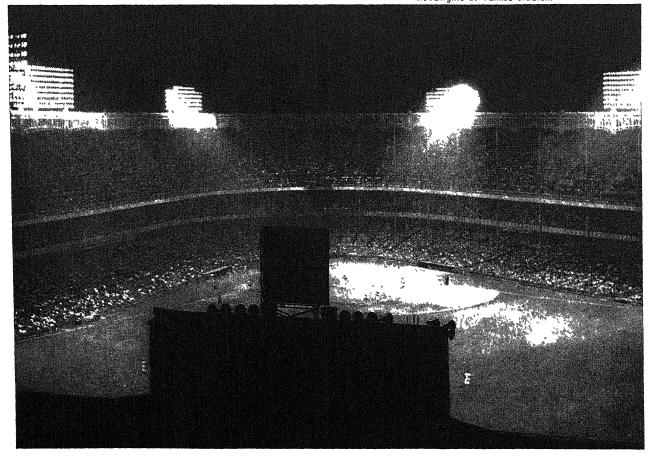

In the forepart of 1939 the rumbling of the approaching international storm could be heard distinctly and the athletes of many European nations were afraid to venture far from such shelter as their own countries afforded. But John R. Cobb, a London fur merchant with a hankering for fast riding in a powerful car, raised the auto speed record to 368.85 m.p.h. in a series of meteoric dashes across the Bonneville Salt Flats in Utah, and Sir Malcolm Campbell pushed the speedboat record up to 141.74 m.p.h. on Lake Coniston, England. The New York Yankees set a baseball record by winning their fourth successive world series when they beat the Cincinnati Reds in straight games in Oct., but by that time it didn't seem important, because Hitler had marched into Poland, the tocsin was ringing all over Europe and Europe was aflame. On Nov. 30, 1939, Russia invaded Finland and a Russian bombing raid spattered with high explosives the main stadium, the adjacent buildings and all the playing fields that the forlorn Finns had so enthusiastically prepared for the holding of the Olympic games of 1940 at Helsinki. Thus the Olympic games, designed to promote international peace, were the first notable sports casualty of World War II.

Anno Domini 1940 saw more than half the world at war. Asia had been in a turmoil for years. The great na-

tions of Europe were locked in a death struggle. African colonies were involved in the European war. Only North and South America were at a distance from the heavy firing, and even these continents were not untouched by war. For one thing, Canada naturally was in it on the British side. For another thing, German U-boats began to lurk along the Atlantic shipping lanes and the American coasts to sink ships carrying supplies to Great Britain and its allies. Under such circumstances the United States, the nations of Central America and the nations of South America were left to play among themselves, and even there the pressure of war was felt. The United States began to build up its military and naval forces. The Selective Service act went into force in the autumn of 1940. Track and field competition was mediocre because of the lack of international rivalry. Polo lost its tang for the same reason, and most of the U.S. polo stars went into the army or navy in a hurry. There was a proposal to hold a set of inter-American games to replace the vanished Olympic games of 1940, but the proposal was dropped for two reasons. Athletes travelling to and from such games would have to go by ship, and few ships were available for such coastwise traffic. And with so much misery and slaughter elsewhere in the world, it didn't seem quite the time to stage a big sports spectacle for all the Americas.

But what might be called the "intramural" sports program in the United States went steadily ahead. Baseball, football, racing, boxing and basketball drew huge crowds. With Canada in the war, ice hockey was hard hit for play-

Baseball enjoyed an undiminished popularity throughout the years of World War II, and night games became an established institution. This picture shows an audience of some 60,000 watching the New York Yankees play the Cleveland Indians under a battery of floodlights at Yankee stadium

crs, but the cripples and the veterans who filled out the big league rosters were good enough to hold the franchise. U.S. industry, when France surrendered on June 17, 1940, practically went on a war basis and the overtime workers in mills, factories, foundries, shipyards and aeroplane plants had plenty of money to spend on the movies and sports spectacles and other amusements in their free hours.

It was, in fact, the beginning of a fantastic period in U.S. sports history. All through 1941 the Selective Service act was drawing athletes from the playing fields of the United States. Big league ball players, college gridiron ·tars, varsity track stars, by ketball experts, famous jockeys and boxing champions were being called up to don soldier or sailor suits. With so many good players taken away, there was a drop in the quality of the competition in all sports, but as the quality of play went down, the number of spectators rose. There were great crowds out to see Joe DiMaggio of the Yankees set a baseball record by hitting safely in 56 consecutive games. The stands and the bleachers were filled as the Brooklyn Dodgers drove to their first pennant in 21 years. Whirlaway was the star of a turf season during which mutuel betting reached a new peak, and Minnesota remained unbeaten in a football season that set new records of attendance and gate receipts. Then came Dec. 7, 1941, and the attack on Pearl Harbor.

In the months when Great Britain was standing alone against the axis, when the luftwaffe was "blitzing" an England that was short of arms, ammunition, food, housing, transportation and medical supplies, some serious folk were astounded—and perhaps shocked—to discover that the English insisted on going ahead with their customary sports program wherever possible. They had dog racing regularly, and horse racing intermittently. They played cricket and football and tennis and golf when they could find time for these games. They attended boxing matches. There was no "petrol" for their cars and no new tires for their bicycles but, where there were sports events, they gathered in such numbers that air raid wardens had to set attendance limits at any contest lest some nazi bomber set a new record not wanted in the history of British sport.

There was the same phenomenon in the United States after the attack on Pearl Harbor and the entry of the United States into World War II. The impact of war and the conditions that went with it served as a spur to the popular interest in all sports. Where the crowds gathered around sports spectacles, there were war relief collections and drives to sell war bonds.

Horse racing raised \$3,000,000 for war relief in 1942 and professional baseball contributed \$1,314,825 to the United Service organizations.

Through 1943, 1944 and 1945, the colleges, amateur athletic clubs and professional teams in the United States were stripped of practically all players who were sound in wind and limb. Only the hundreds of service teams-including those of the U.S. military academy and U.S. naval academy in intercollegiate competition-had players full of youth and health. Fordham, Alabama, Tennessee, Stanford, Santa Clara and other colleges noted for their fine football teams abandoned the gridiron (and in some cases all varsity sports) for the duration of the war. Some of the minor leagues in football and baseball had to close down for lack of players. But some colleges and the professional field in general went ahead in sports with young fellows whose physical handicaps kept them out of the armed forces and doddering athletic veterans called back to fill out the teams and the sports programs. Yet the crowds that turned out to watch the competition of the subnormal players and makeshift teams grew larger month by month.

War workers were making high wages. There was a shortage of civilian goods on which to spend this money. Watching games provided relaxation and amusement for men and women who put in long hours on war work. So the turnstiles clicked at an ever-increasing rate, and new attendance records were set in all directions.

Gasoline rationing caused the shifting of some games, boxing bouts and race meetings in many cases, and horse racing was banned in the United States for one period of four months but, despite all handicaps, the spectators managed to reach the scenes of sporting action in record numbers. These conditions persisted long after the firing ceased in Europe and the Pacific area. Belmont Park had its first \$5,000,000 betting day on Sept. 22, 1945, and in that same year more than \$1,500,000,000 was poured through the mutuel machines at race tracks in the United States. Teams, leagues and sporting events of all kinds set attendance records through 1946. There was some improvement in the level of competition because of the return of many athletes from the wars, but certainly the playing was not yet up to the prewar standard, yet record crowds rushed through the turnstiles wherever there was a sports contest with a fence around it. A restless population, a supply of "loose money" and the lingering shortage of civilian goods on which to spend it accounted for these astonishing attendance records in sports.

There were some great champions and some outstanding performances in the field of sports during the decade that was dominated by World War II. Those who blandly believe that the British are a bit on the slow side should take note that, in this dramatic decade, new world speed records on the ground, on the water and in the air were set by three Englishmen—John R. Cobb, Sir Malcolm Campbell and Capt. E. M. Donaldson (see above).

Three U.S. athletes were outstanding in their own fields. Don Budge was the tennis star of the decade. Joe Louis became one of the great heavyweight champions of pugilistic history. Cornelius Warmerdam far outclassed all other pole vaulters in the world and hoisted the record to 15 ft. 734 in.

But all this—except the fast ride in the jet plane—took place before Hitler's armies poured into Poland and started the global conflagration.

It is significant that the only notable sports feature through the years of war was the joint contribution of two athletes of a neutral nation. Arne Andersson and Gunder Haegg (Hägg) of Sweden took turns lowering the mile record until Haegg finally put it at 4:01.2, only to have the whole series of record-breaking marks left under a shadow when the two great Swedish runners were suspended from amateur competition on the charge of accepting money for running. In the countries that engaged in the struggle, the war produced a novel contrast in the field of sports; a great decrease in the quality of play because so many athletes were in the armed forces, and a vast increase in the number of spectators who turned out to witness such sports events as the grim years had to offer.

158 Spruance, Raymond Amos

Spruance (1886-), U.S. naval officer, was born July 3, 1886. He entered the navy in 1903 and was promoted through the ranks to rear admiral in Dec. 1939. He served as commandant of the 10th naval district, San Juan, Puerto Rico, 1940-41 and was sent to the Pacific theatre of operations at the outbreak of war with Japan. Adm. Spruance was in complete charge of operations during the landings of the U.S. marines on the Gilbert Islands of Makin and Tarawa, Nov. 20-23, 1943. He also directed naval operations in the Okinawa landings. After Hirohito's surrender broadcast, Spruance frankly aired his views on the war and politics in the Pacific (Aug. 25, 1945). He voiced the belief that the U.S. navy should be drastically cut and that the U.S. be satisfied with the Marshalls and Carolines and not take bases off the Asiatic coast at the risk of offending other powers. He also praised the Japanese for putting up a "hell of a fight," declaring they "fought an excellent war considering what they had to start with."

On Nov. 20, 1945, Spruance succeeded Adm. Chester W. Nimitz as commander in chief of the Pacific fleet. In turn, he was replaced (Jan. 13, 1946) by Adm. John H. Towers. Spruance left active duty to become president of the navy war college.

Squash Racquets

National dominance in squash racquets from 1937 to 1946 became principally a two-man proposition. It started with the second and third national titles for Germain G. Glidden of the Harvard club, New York city, in 1937 and 1938 and ended with the prewar and postwar dominance of Charles W. Brinton of Philadelphia. As a Princeton university undergraduate, Brinton won the national squash racquets title in 1941 and 1942 and came back for his third championship in 1946 after the tournament had recessed three years because of World War II.

Philadelphia cornered most of the squash racquets titles during the decade. After Glidden failed to defend his title in 1939, Donald Strachan, A. Willing Patterson and Brinton made the men's title the legacy of Philadelphia. Anne Page and Cecile Bowes, both of Philadelphia, dominated the women's division until the tournament was abandoned at the start of World War II. Miss Page won it in 1937 and 1939, while Miss Bowes triumphed in 1938, 1940 and 1941.

International competition for the Lapham trophy between the United States and Canada resulted in a five-to-five split during the ten-year period. In winning the 1946 test, the United States captured its 16th match in 25 with Canada.

Racquets, also hard hit during World War II, brought forth Robert Grant III of New York as its dominant figure. Except for a one-year reign of Warren Ingersoll III of Philadelphia as 1940 champion, Grant held the crown all the remaining years after 1937. He also won the amateur

court tennis title in 1946 and thus became the first player in 46 years to hold both titles simultaneously. Harry F. Wolf of New York won his 11th straight squash tennis crown in 1940, after which Joseph Lordi of New York was champion in 1941 and Frank R. Hanson of Columbia university in 1946. (M. P. W.)

Stalin, Joseph Vissarionovich

Joseph Stalin (1879—), soviet statesman, was born Dec. 21, 1879, in the Georgian town of Gori, the son of a poor shoemaker named Djugashvilli. Complying with his mother's wish that he study for the priesthood, he entered the Tiflis Theological seminary in 1893. However, he developed a greater interest in socialism than theology and was expelled from the seminary five years later. During that time he had become active in the revolutionary underground and adopted various pseudonyms, including Stalin, to evade the police.

First arrested in March 1902, Stalin was exiled to Eastern Siberia. He later escaped, resumed his political activities and became associated with Lenin and other Bolshevik leaders. Between 1908 and 1917, he was exiled four times, escaping on three occasions. He was freed after the revolution of Feb. 1917; returning to St. Petersburg, he was named to the central committee of the Communist party. Recognized as an able administrator, he was appointed commissar of nationalities in Oct. 1917; he was also made People's Commissar of the Workers' and Peasants' Inspection in 1922. During the civil and interventionist wars, Stalin fought with the Red army against white Russian and Polish forces. He became a central figure in soviet politics after his appointment in 1922 to the all-powerful position of general secretary of the central committee of the Russian Communist party.

After Lenin's death, the struggle between Stalin and Leon Trotsky (q.v.) became critical, with Stalin leading the faction that urged establishment of "socialism in one country"; Trotsky, on the other hand, insisted on continuation of the original Marxist concept of world revolution. But the mercurial Trotsky was no match for Stalin in political manoeuvring and lost out; he was deported in 1929, and Stalin became the undisputed leader of the party.

In the succeeding years, Stalin eliminated opponents of his measures, chiefly the "Old Bolsheviks"; during the great treason purges of 1936–38, many anti-Stalinists were executed and by 1939 his position as leader of the

U.S.S.R. was unquestioned. He did not hold state office until a month before the German invasion, when he assumed the post of premier, May 6, 1941. After the nazi attack, he also became commander-in-chief of the armed forces, chair-

Foreign Minister V. Molotov and Marshal Joseph Stalin during an intermission at the Yalta conference of 1945

man of the state committee of defense and commissar of defense. In March 1943 he was invested with the rank of marshal of the soviet union and in June 1945, he was named generalissimo of the U.S.S.R.

During World War II, Stalin proved a stern leader. In 1941, he directed the retreating Red army to pursue a "scorched earth" policy without regard to cost. In Nov. 1943 Stalin met with his wartime allies—President Roosevelt and Prime Minister Churchill—at Tehran in the first of the Big Three conferences for discussion of grand strategy and postwar policy. This parley was followed by their second meeting at Yalta (Feb. 4–11, 1945); the final parley of soviet, U.S. and British government leaders was held at Potsdam (July-Aug. 1945).

The end of World War II witnessed a rapid deterioration in relations between the soviet union on one side and the U.S. and Britain on the other. The rift was heightened by Churchill's speech at Fulton, Mo., Mar. 5, 1946, in which he called for an Anglo-U.S. "fraternal" alliance to block soviet "expansionism." Stalin subsequently retorted that the Fulton speech was a "dangerous act" intended to sow discord among the Allies. In later statements, he branded Churchill as one of the foremost "incendiaries" trying to provoke a third World War.

Stalingrad

At the time of the Russian Revolution, Stalingrad (then called Tsaritsyn) was a dilapidated provincial town of slightly more than 100,000 inhabitants. It contained two small metallurgical works, some handicraft industries, and many sawmills concerned with the disposal of timber floated down the Volga from the forest zone. With the development of the Caspian oil fields, the importance of Stalingrad as a transit port increased, and by 1937 it was

carrying more than 30,000,000 tons of cargo annually mainly oil going north and timber going south. But its real transformation into the third industrial city of the U.S.S.R with a population in 1939 of nearly 500,000 was due to its key position in the first two five-year plans, involving the expansion of the Red October metallurgical works and the mauguration of the largest tractor plant in the U.S.S.R. By 1937, Stalingrad was turning out 4,000 tons of high-grade steel and rolled steel every year and supplying tractors to all the farms of the lower Volga steppe. The city owed its record expansion to its situation on the arterial Volga with a railway junction connecting it with the Caucasus on the one hand and the Donetz coal field on the other. Its history from 1937 to 1941 was intimately bound up with that of the Red army, since the famous tractor works was able to switch almost overnight to the production of tanks. Tanks were being turned out in large numbers right up to Aug. 1942, when Adolf Hitler opened his Stalingrad offensive; and for many weeks afterwards, at the height of the battle for the city, the great Stalingrad factories acted as front-line maintenance and repair shops.

The all-out attempt to seize the city was started on Aug. 23, 1942, with a 1,000-bomber raid, followed by a demand for surrender two days later. Almost at once Stalingrad had become the real and symbolic pivot of the Russian defense. Its capture, to which Hitler had publicly committed himself, and which seemed inevitable to the most optimistic, would have led to a double turning movement. involving Moscow and the whole line of the Volga on the one hand, and the Caucasus on the other. The Russian defense took its place among the epic stories of war. In its final stages the Russian headquarters, driven back to the very edge of the Volga and completely encircled by land, lived in dugouts in the steep river banks, while their men fought from room to room in rumed factories and houses. During this battle, which lasted until the final surrender of the German 6th army on Jan. 31, 1943, and which marked a turning point of the war, the new city, with its proud buildings, tree-lined avenues and parks, was totally destroyed.

But even before the war was over reconstruction was under way, and its complete restoration and enlargement was a priority under the new plan. (E. CRA.)

Stamp, 1st Baron

Baron Stamp of Shortlands (Josiah Charles Stamp) (1880-1941), British economist and banker, was born June 21, 1880, in London. In 1896 he started work as a clerk in the inland revenue department, 40 years later he was one of the most powerful figures in British finance. During his lifetime he served as economic adviser on various government committees, was a director of the Bank of England and chairman of the board of the London Midland and Scottish railway. Lord Stamp exerted a powerful influence on British foreign policy during the critical years preceding the outbreak of World War II and he actively supported Neville Chamberlain's efforts to appease Hitler. He was appointed chief economic adviser to Chamberlain's war cabinet in Oct. 1939. Lord and Lady Stamp and their eldest son, the Hon. Wilfred Carlyle Stamp, were killed in a German air raid on London April 16, 1941.

Standards, National Bureau of

The national bureau of standards was established as the laboratory of the lederal government, having primary responsibility for basic research in physics, chemistry and engineering, except in certain special fields which, by legislation, were assigned to other agencies. One of its primary duties is to maintain the uniformity of standards throughout the nation. It has the custody of all the national standards and it calibrates in terms of these standards the measuring equipment used by the federal government and by tax-supported agencies of the various states. This is done free of charge. Similar comparisons are made for any citizen on the payment of a fee, as required by law.

The mass production of interchangeable parts for which U.S. industry became famed was made possible by this unremitting attention to standards. When the measuring equipment used in industry conforms with the national standards, the axles of an automobile may be made in one lactory, the ball bearings in another, the wheels in a third and yet the parts will assemble perfectly, without looseness or without strain.

The parts are made so nearly identical that they are entirely interchangeable.

Another activity of the national bureau of standards is the testing of apparatus, equipment and supplies purchased by government agencies, to find whether these supplies measure up fully to the requirements of the federal specification under which they were purchased. Much time is given to the work of the federal specifications board in preparing the specifications under which federal purchases are made. These specifications are widely used also by state purchasing agencies. Assistance is also given trade groups in simplifying the sizes and varieties of manufactured products to reduce costs and in developing commercial standards for certain types of goods.

High-Voltage Laboratory.—In 1938, \$500,000 was appropriated for the construction of a high-voltage laboratory, a project which had been urged by electrical manufacturers for years. This enabled the bureau to extend into the field of high voltages the standardization work it had long carried on in connection with low-voltage measurements. X-ray equipment, working up to 1,400,000 volts, was also installed in the new laboratory which made it possible to undertake much-needed research and to calibrate dosage-meters for the powerful high-voltage X-ray tubes being installed in hospitals, and thus help safeguard the lives of patients receiving X-ray treatment. The highvoltage surge generator in the new laboratory was extensively used during World War II in developing ways to protect wooden gliders and their occupants from lightning. The X-ray group developed radiographic methods for detecting cavities in the T.N.T. charges of high-explosive shells, which might lead to a disastrous premature explosion in the gun itself. Similar studies were made to detect fissures in the powder charges in large rockets resulting in non-uniform burning of the powder so that the rocket did not follow its predicted path. After these methods were developed, large X-ray plants were installed by the U.S. army in suitable places for the routine inspection of explosives. The X-ray section also carried out extensive tests of X-ray equipment for the surgeon general of the

army, and made surveys of X-ray equipment in navy yards, hospitals and factories in order to see that the operating personnel was fully protected from stray radiation.

Enlargement of Bureau Grounds.—In 1940 the bureau was authorized to purchase an undivided tract of 12.5 ac. immediately adjoining the bureau grounds. The land was utilized almost immediately as a site for a materials testing laboratory costing \$600,000, and for three laboratories built by the war department for the use of the bureau staff in the development of proximity fuses.

Broadcasting Standard Frequencies.-In 1941, a new bureau station (WWV) for broadcasting standard radio frequencies, costing \$230,000, was authorized for construction at Beltsville, Md. A limited service of this kind had been provided by the bureau for some years, but the new transmitters were sufficiently powerful to cover not only the United States and the North Atlantic, but a large part of the Pacific as well, the signals being received with ease in New Zealand. This service was utilized extensively by the navy and army throughout the war in maintaining the correct frequency of their countless transmitters. It was also widely used by firms making radio equipment, by the Federal Communications commission and by broadcasting stations generally. These standard frequencies are generated by means of a group of quartz crystal oscillators, working under conditions which are rigidly controlled as regards temperature and pressure. The signals broadcast do not vary as much as 1 part in 10,000,000 from the announced standard frequency. This is comparable with the precision with which the mass of standard kilogram or the length of the standard metre is known. But unlike the metre and the kilogram, standards of frequency cannot be stored in a vault until needed. They must be continuously generated and broadcast to serve their intended purpose.

Optical Glass.—Up to the time of World War I, the United States had been dependent entirely upon Germany, Belgium and France for the glass used in making the optical parts of periscopes, range finders, cameras and binoculars. In 1914 this supply was suddenly completely shut off, and U.S. manufacturers undertook the new and difficult job of making optical glass under the technical guidance of the geophysical laboratory of the Carnegie institution, with the co-operation of the national bureau of standards. The bureau at that time built an optical glass plant which was kept in operation after World War I through the farsighted support of the navy, and produced all the optical glass needed for the navy's peacetime requirements. During this period much was learned about the large-scale production of optical glass of high quality that would meet exacting specifications as to dispersion and refractive index and thus facilitate the mass production of optical equipment if this should prove necessary.

At the beginning of the U.S. defense program prior to World War II, the bureau foresaw the probability of a greatly expanded need for optical glass, and an appropriation of \$125,000 for the enlargement of the glass plant was authorized by congress. With these new facilities the bureau and the Bausch and Lomb Optical company, the only commercial firm that had continued optical glass production after World War I, were able to supply all the optical glass needed until other firms could be brought into production. At the request of the armed services the bureau opened its glass plant for the training of the technical personnel of four U.S. firms which were about to undertake the production of optical glass, as well as to representatives of the Australian and Canadian governments for

similar purposes. At this time the navy department also constructed a large annex to the bureau's glass plant in order that production there might be further expanded

During the war years, the bureau manufactured nearly a million pounds of optical glass of high quality, conforming strictly to the specifications of the armed services Practically all of this was delivered in the form of moulded prisms and lens blanks with curved surfaces, these pieces being so shaped as to require the minimum amount of grinding in the subsequent finishing operations. At one period about 400 persons were engaged in this work. The whole operation was directed by the small group of experienced bureau personnel headed by P. H. Bates.

Staff.—The staff of the bureau increased from about goo in 1939 to approximately 2 250 during the last three war years. The securing of new trained personnel became more and more difficult as the war progressed and the majority of the new appointees came with little or no laboratory experience. Deferment of technical men from induction into the armed services was at first granted, but later trained men were inducted without recognition of the fact that the early solution of the technical military problems upon which they were engaged was vastly more important to the all out war effort than any contribution these men could make in the enlisted ranks. In all 499 members of the bureau staff joined the armed forces.

Atomic Bomb.—The work of the federal government on this project was initiated in Oct 1939 when President Roosevelt appointed Lyman J Briggs director of the na tional bureau of standards as chairman of a committee to investigate the possibilities of utilizing the atomic fission of uranium in warfare. In the light of the final achieve ment, it is difficult to realize how little was known about uranium in those early days. The committee recognized at once the possibility of using uranium fission as a source of power but decided to concentrate its efforts on the development of a bomb Both applications were dependent upon the possibility of establishing a chain reaction. This vitally important problem was entrusted to Prof Enrico Fermi at Columbia university who three years later finally saw the great pile of graphite embedded with ura nium begin to heat up spontaneously. The chain reaction had been established But this was not accomplished with out painstaking and brilliant work on methods to remove impurities from the graphite and uranium and on methods to reduce the uranium ore to pure metal. In both of these lines of research the bureau of standards played an important part

In June 1940 the uranium committee was placed by the president under the newly organized National Defense Research committee By this time it was known that fission occurred only in the manium isotope 235 which con stituted only 7% of the total parent mass of uranium To secure the violent explosive chain reaction required in a bomb, it was necessary to separate and concentrate the isotope 235 in almost pure form. Isotopes cannot be sepa rated by chemical processes and accordingly an intensive and exhaustive investigation of various physical methods for separating the uranium isotopes was undertaken By the end of 1941, the research had advanced to the point where it was believed that an "all out" effort involving the expenditure of enormous sums, was justified The proj ect was transferred to the Office of Scientific Research and Development under the general direction of Vannevar Bush, who, in June 1942, appointed a new executive com mittee consisting of J B Conant chairman L J Briggs A H Compton, E O Lawrence, E V Murphree and H C Urey to supervise the vast undertaking Procurement and engineering functions were taken over by the US army engineers (Manhattan district) under Maj Gen L R Groves By May 1 1943 the project had reached such an advanced stage of development that it was transferred to the army for the all out production effort

During the war about 60 members of the bureau staff were engaged on the atomic bomb project. Some of them were assigned to the Oak Ridge and Los Alamos labora tories. The bureau served as a central control labora tory for determining the purity of the uranium and other products that were used in the project. Thousands of chemical and spectrographic analyses were made during the course of this work. Measurements were made of the radium recovered from the uranium ores. Methods for separating the uranium isotopes were studied. Yet the work was so closely guarded that the disclosure of the bureau's participation in the atomic bomb project came as a complete surprise to most of the bureau staff. (See also Atomic Bomb.)

Proximity Fuses—One of the most important of the new weapons developed during World War II was the radio proximity fuse. This fuse cluses a projectile to explode it it passes within 50 to 75 ft of an reroplane or at a height of 30 to 50 ft as it approaches the ground if the attack is against ground objectives. In other words, the proximity fuse does not need to hit the target in order to function and this increases enormously the effectiveness of the projectiles on which the fuse is used.

The bureau served as the central laboratory of the Na tional Defense Research committee in the development of radio proximity fuses for bombs rockets and other non iotating projectiles. At one period of the war about 350 bureau people were engaged in this undertaking, under the leadership of Harry Diamond The fuse took various forms in adapting it to different types of projectiles but in each instance it incorporated a complete miniature radio transmitting and receiving set so small that some models could be covered by a man's hand. When the radio waves generated in the fuse struck the target a small part of the radiation was reflected back to the approaching pro jectile and received by the fuse. The fuse exploded the projectile when this reflected radiation reached the required intensity. Proving ground tests showed that when a fragmentation bomb is exploded 30 ft above the ground by means of a proximity fuse it becomes from 10 to 20 times as effective against troops in foxholes as the same bomb equipped to explode on contact with the ground Proximity fuses were used effectively by the army an forces in the Mediterranean theatre and such fuses on bombs and rockets were widely used by U S forces against Iwo Jima and other Japanese strongholds during the lat ter months of the war

When the proximity fuse project reached the stage of large scale production and the importance of electronics in ordnance development had been convincingly demon strated, the bureau of ordnance of the army took over the financial support of the work and a large laboratory was constructed on the bureau grounds for the use of the proximity fuse group. Their duties at the close of the war were expanded to include other applications of electronics to ordnance development. The laboratory also was to be supported by funds from the bureau of standards for electronic research in nonmilitary fields (See also Radar).

Guided Missiles.—Members of the bureau staff under the leadership of Dr H L Dryden worked closely with the NDRC and the navy in the development of rad ir homing

missiles, i.e., missiles which automatically seek out their target and guide themselves to hit the target. This was one of the largest of the bureau's war projects, and the great hydraulic laboratory building was given over entirely to this undertaking. In one form of this weapon a bomb is housed in a glider which carries in its nose the necessary radar and control mechanism. The glider "illuminates" the target ship with short bursts of radio waves and "homes" in the direction from which come the waves that are reflected back from the target. In making an attack the glider is carried underneath a mother aeroplane to a point beyond the range of gunfire and released after being "told" what target it is to attack. According to the official navy release this guided missile destroyed many tons of Japanese combatant and merchant shipping during the last year of the war.

Forecasting "Radio Weather."-Large military operations involving the participation of ground, sea and air forces had to be definitely scheduled well in advance of the day of attack. Failure of the all-important radio communication system of the mission on the day selected. owing to magnetic storms or similar disturbances, would jeopardize the success of the whole undertaking. Accordingly the combined chiefs of staff asked the bureau's radio section to undertake the forecasting of conditions which might interfere with radio communication. This work was carried out under the leadership of Dr. J. H. Dellinger. who had shown earlier that the appearance of sun spots is often accompanied by marked disturbances in radio communication. The service inaugurated provided for both daily and long-range forecasts. So successful was the undertaking that at the end of the war the military sponsors strongly urged that a direct appropriation be made to the bureau to continue and expand the service as a peacetime aid to air and sea navigation. This recommendation was approved by congress, and a wartime develop ment, born of necessity, found a peacetime application in safeguarding lives and shipping and in aiding transportation by air and sea.

Grading Quartz Crystals.-The "heart" of a radio transmitter is the oscillating quartz plate, for it fixes the frequency of the signal sent out. Literally millions of these crystal oscillators were made during World War II. The quartz crystals from which they were cut were imported by the government from Brazil and were classified and graded as to quality by the bureau's optics division under the supervision of F. J. Bates. Each individual crystal was examined for imperfections in an oil bath with the aid of an arc lamp. To determine the types of imperfections which would prevent the proper performance of the finished oscillators, plates were cut from crystals with various imperfections and tested as oscillators. During the years 1942 to 1945 inclusive, more than 10,000,000 lb. of quartz crystals were graded for the government in the bureau's laboratory.

MANY OTHER projects were carried out by the bureau staff for the U.S. armed services. The flag of the bureau of ordnance of the navy was awarded to the bureau of standards early in the war. The bureau was also one of the first agencies to receive the joint army-navy "E" award. On V-J day this pennant was flying at the bureau's masthead carrying five stars, symbolizing continued "excellence in production" throughout the war period.

At the close of the war Dr. Briggs retired as director

of the national bureau of standards after a service of 12 years in this post. He was succeeded by Dr. Edward U. Condon, a former member of the uranium committee, who was promptly selected by the senate committee on atomic energy as its scientific adviser, and later was appointed a member of the president's committee to observe the atomic bomb experiments at Bikini. Plans were under way in 1946 at the bureau for a greatly enlarged research program in the field of nuclear physics, including the installation of a large betatron, and for an extension of its peacetime research activities in many other fields.

(L. J. Br.)

Standley, William Harrison

Standley (1872—), U.S. naval officer and diplomat, was born Dec. 18, 1872, at Ukiah, Calif. A graduate of the U.S. naval academy (1895), he was commissioned an ensign. He served in the Spanish-American War, and was a naval captain during World War I. Raised to the rank of rear admiral in 1927, he was assistant chief of naval operations, 1928–30, and was chief of naval operations, 1933–37, with the rank of admiral. Although he retired in 1937, he was recalled to active duty in March 1941 and in the fall of that year he served as a member of a mission to the U.S.S.R. to confer with British and Russian officials on means of speeding aid to Russia.

Adm. Standley was appointed ambassador to the soviet union Feb. 9, 1942. Although favourably impressed with the Russians, he nevertheless criticized their failure to publicize the amount of aid they were receiving from the United States; as a result, soviet newspapers devoted more space to this topic. His resignation as ambassador was announced Oct. 1, 1943.

Stanley, Oliver Frederick George

), British politician, son of the Stanley (1896-17th early of Derby, was born May 4, 1946. Educated at Eton and Oxford, he was an artillery major in World War I and was awarded the military cross and the croix de guerre. On returning to civilian life after the war, he was admitted to the bar in 1919. Stanley held cabinet posts in the Ramsay MacDonald, Stanley Baldwin and Neville Chamberlain governments, and in 1940 was named secretary of state for war by Chamberlain, but was dropped by Winston Churchill when the latter became prime minister in May 1940. In Nov. 1942 Churchill reshuffled his government and Stanley returned to the cabinet as colonial secretary. In March 1943, his statement rejecting any kind of scheme for international administration of British colonies after the war-a view identical with that of Churchill -was strongly criticized by some factions in England and the United States.

He was renamed colonial secretary in the Conservative cabinet formed by Churchill after Germany's defeat in 1945, holding this post until the Labourite victory (July 1945) in the national elections swept the Conservatives out of office.

Stark, Harold Raynsford

Stark (1880-), U.S. naval officer, was born Nov. 12, 1880, at Wilkes-Barre, Pa. A graduate of the U.S. naval academy, he was commissioned an ensign in 1905. During World War I, he was on the staff of Adm. William S. Sims, commander of U.S. naval forces in European waters. He was appointed chief of naval operations, March 15, 1939, with the rank of admiral. Succeeded in this office on March 9, 1942, by Adm. Ernest J. King, he was assigned to command U.S. naval forces in European waters. In this

capacity, he also acted as liaison officer between the British admiralty and Washington. In the summer of 1943, Stark, with Gen. Charles de Gaulle's assistance, was able to obtain co-operation of both civil and military French officials with U.S. armed forces in New Caledonia and New Hebrides. Stark also lent a diplomatic hand in the agreement achieved in 1943 between De Gaulle and Gen. Henri Giraud. Later he was head of the U.S. 12th fleet operating in the European theatre. Stark's retirement from the navy was announced July 14, 1945.

In the navy reports published Aug. 29, 1945, on responsibility for the Pearl Harbor disaster, Stark was blamed for failure to transmit "important information" in his possession "during this critical period." In his testimony before the Pearl Harbor congressional investigating committee, Dec. 31, 1945, Stark said that "specific warnings" of possible Japanese hostile actions were sent to Pacific commanders between Oct. 16 and Dec. 6, 1941.

Starvation

See FAMINES.

Starzynski, Stefan

Starzynski (1893-1940?), Polish politician and mayor of Warsaw from 1937 to 1939, was educated in a Warsaw high school. He joined the Polish army, fought in World War I and in the Russo-Polish campaign. After the latter campaign, Starzynski was a member of the Polish delegation to the Polish-Soviet commission for repatriation, 1921-24. A close student of municipal government, he was elected mayor of Warsaw in 1937. He organized civilian resistance when German forces approached the city in Sept. 1939 and worked vigorously to maintain the morale of the capital's inhabitants. He stubbornly refused to yield the city, and his radio broadcasts appealing for British and French help were heard over the world. After the fall of Warsaw, Starzynski was taken prisoner by the Germans. London press dispatches subsequently declared that he was executed by the nazis in Dachau concentration camp, Sept. 1, 1940. This was denied by the German D.N.B. (official German news agency before the close of the war), which said Starzynski was released before Christmas 1939 but broke his word of honour and fled to a foreign country.

After the war an official of the Warsaw municipal government, who fought beside Starzynski, reported that the mayor had been killed in a German concentration camp a few months after his capture.

Stassen, Harold Edward

Stassen (1907–), U.S. politician, was born April 13, 1907, in West St. Paul, Minn. After studying at the University of Minnesota Law school, Minneapolis, Minn., 1923-29, he was admitted to the Minnesota bar in 1929. Elected governor of Minnesota on the Republican party ticket in 1938, he was inaugurated in Jan. 1939. Reelected governor for the 1941-43 term, he served as temporary chairman and keynoter of the Republican National convention in 1940 and as national chairman of the Governors' conference and of the Council of State governments, 1940-41. He resigned his governorship in 1943 to join the U.S. navy, becoming commander and flag officer to Adm. William Halsey and participating in four naval engagements. In Feb. 1945 Stassen accepted President Roosevelt's appointment as delegate to the San Francisco

conference of the United Nations. He subsequently declared that U.S. acceptance of the United Nations security charter and adoption of a flexible foreign policy could give the world a minimum of 50 years of peace. Stassen was released from the navy on Nov. 15, 1945.

He was regarded as one of the "dark horse" G.O.P. candidates for the 1948 presidential nomination, although his chances had been reduced considerably by the victory of "regular" Republicans in the Nov. 1946 national elections.

Steelman, John Roy

Steelman (1900-), U.S. economist and government official, was born June 23, 1900, in Thornton, Ark. Graduated in 1922 with an A.B. degree from Henderson Brown college (Arkadelphia, Ark.), he took his master's degree from Vanderbilt university, Nashville, Tenn., in 1924. Four years later (1928), he won his Ph.D. degree from the University of North Carolina, Chapel Hill, N.C., and became an economics professor at Alabama State College for Women, Montevallo, Ala. (1928–34). He accepted in 1934 an offer made by Frances Perkins, secretary of labour, to become a member of the U.S. conciliation service. He served as her special assistant from 1936 to 1937, becoming director of the conciliation service in the latter year. He resigned this post in 1944 to set up an industrial relations bureau in New York city, but returned to Washington in 1945 as special assistant to Secretary of Labour Lewis B. Schwellenbach.

Acting as President Truman's aide, Steelman was a central figure in settlement of the railway strike May 25, 1946, and the following June 14, the president named Steelman as director of the Office of War Mobilization and Reconversion. On July 25 Truman gave Steelman the added post of temporary stabilization chief.

Steelman, who had on several occasions interceded for John L. Lewis in labour disputes, was one of the counsels called in by President Truman for a conference on the U.M.W. coal strike staged in Nov. 1946. It was then reported that the president rejected the advice of both Steelman and Secretary Schwellenbach, who favoured negotiating with Lewis.

Stettinius, Edward R., Jr.

Stettinius (1900–), U.S. industrialist and statesman, was born Oct. 22, 1900, at Chicago, Ill. He was edu-

cated at the University of Virginia (1919–24) Charlottes ville, Va. In 1938 he was made chairman of the board of the U.S Steel corporation Stettinius, who had been given a number of important posts in war production agencies by President Roosevelt, was made lend lease administrator, Aug 28, 1941, and special assistant to the president the following month When aid to the Allies was consolidated in the Office of Lend Lease administration, Stettinius was named head of the new organization, Oct 28, 1941 with blanket powers to approve disbursements. He remained in this post until Sept 25, 1943, when Roosevelt named him successor to Sumner Welles, undersecretary of state

Upon Cordell Hull's resignation as secretary of state because of ill health, Stettinius was appointed to the post, Nov. 27, 1944, becoming the second youngest secretary of state in US history In Dec 1944 he told Britain that the European peoples should be permitted to work out their own governments without interference, this statement was regarded as criticism of Winston Churchill's opposition to Count Carlo Sforza's appointment as Italian foreign minis ter In 1945 Stettinius attended the Yalta conference (Feb 4-11) and welcomed delegates to the Inter American Conference on War and Peace at Mexico City (Feb. 21-March 8). His subsequent espousal of Argentina's candidacy for United Nations membership was widely criticized because of that country's totalitarian form of govern ment. His resignation as secretary of state was accepted June 27, 1945, by President Truman, who thereupon appointed him US member of the United Nations security council and chairman of the US delegation on the UN general assembly

Stettinius attended the UN sessions in London, Jan-Feb 1946, and in New York city the following spring His resignation as US delegate to the UN security council was accepted by President Truman June 3, 1946. Ill health was the apparent reason behind his resignation although it was believed that he was dissatisfied with his role of understudy to Secretary of State James Byrnes, who dominated US activities in the security council

Stilwell, Joseph W.

Stilwell (1883–1946), US army officer, was born March 19, 1883, at Palatka, Fla Graduated from West Point in 1904, he served with the AEF in World War I After Pearl Harbor, he was promoted to lieutenant general (Feb. 1942) and later served as chief of staff to Chiang Karshek. In March 1942, Chiang gave Stilwell command of the 5th and 6th Chinese armies in the Burma theatre Retreating before the Japanese advance, Stilwell reached India After the fall of Burma in May 1942, he candidly confessed "I claim we got a hell of a beating We got run out of Burma and . . . I think we ought to find out what caused it, go back and retake it" During 1943, as US commander in southeastern Asia under Lord Louis Mountbat ten, he was busy preparing to do so.

Stilwell's efforts were abruptly interrupted Oct 28, 1944 when he was relieved of his command in the China Burma India theatre and recalled to Washington His re moval was attributed to growing friction between himself and Chiang Kai shek over disposition of Chinese troops as well as over strategic and political problems. Prior to his recall, Stilwell had been named (Aug. 1944) a full general It was announced Jan. 25, 1945, that Stilwell had been appointed commander of army ground forces in the U.S. On June 22, he was named commander of the U.S. 10th army in Okinawa. He took over command on June 28 and

on Sept 7 accepted the suitender of some 105,000 Japanese troops scattered throughout the Ryukyus On 1 eb 23,1946, he was appointed commander of the reactivated 6th army on the Pacific coast. He died at Letterman General hospital in San Francisco. Oct. 12,1946

Stimson, Henry Lewis

) US statesman and lawyer was Stimson (1867born Sept 21, 1867 in New York city He was graduated from Yale university with an AB degree in 1888 and from Harvard with an AM degree the following year he was admitted to the New York bar in 1891. After serv ing as secretary of war in President William Howard Talt's cabinet, 1911-13 he went to France during World War I as a colonel in the field artillery In 1927, he was appointed by President Calvin Coolidge as governor gen eral of the Philippines and was secretary of state in Her bert Hoover's cabinet, 1929-33 He led the US delega tions to the London naval conference in 1930 and the disarmament conference in 1932 Stimson, who had advo cated that the United States take a strong stand against Japanese aggressions in Manchuria in the early 1930s was appointed secretary of war by President Roosevelt on June 20, 1940 In the cabinet, he became a militant sup porter of the lend lease bill revision of the neutrality act to permit US convoys extension of selective service and removal of the prohibition on use of US armed forces outside of the western hemisphere. After the Pearl Har bor attack, he carried out a program for building a 2 000 000 man air force and an army of at least 7 500 000 men by 1943 In Jan 1944 he urged enactment of labour draft legislation 'to extend the principles of democracy and justice more evenly" between soldier and civilian In 1945 he endorsed a proposal for unified aimy navy com mand under a single secretary and advocated peacetime military training

He resigned as secretary of war Sept 18, 1945 In a report to the Pearl Harbor investigating committee (March 21, 1946), he disclosed that Roosevelt and his war cabinet had agreed on Nov 28, 1941, that the United States would be forced to fight if Japan attacked British Malaya because of the threat to the Philippines

Stockholm

The end of the 1930s saw a period of rapid develop ment in the history of the capital of Sweden The great increase in population (to 654,864 in 1944) gave rise to brisk building activities, with a peak in 1939. New areas were covered with up to date blocks of apartment houses on the outskirts of the town and in the suburbs The volume of traffic in the central part of the town continued to increase, a project of driving an underground traffic tunnel through the town was discussed, and a thorough regulation of the district of Lower Norrmalm, called "the city," which would create new thoroughfares and lead to clearances of the built up areas, was proposed A clearance of the historical nucleus of the town around the castle, the old town, had begun When World War II broke out, all these plans had to be shelved. All energies then had to be devoted to the construction of air raid shelters and organization of air-raid precautions. As a result of the blockade, all motor vehicles had to be equipped for producer gas, and coke was replaced by wood The fuel problem was difficult to contend with during the winters which were the bitterest for 125 years. Help

to refugees and children first from Finland during the winter war and later from the other neighbouring countries became an ever greater problem of organization. The increase of population and stagnation of building activities led to a shortage of houses in 1940 which continued up to the end of 1946.

Work was begun on the great underground line and the reconstruction of Lower Normalm was decided on during the war Parks, playgrounds and recreation areas were planned several schools and hospitals were erected Three museums were entirely rearranged during the war years the State Historical museum, the Army museum and the new municipal city museum

It was necessary to build provisional traffic lines in the centie of the town, first at the traffic junction at Tegel backen and then over Strommen (the stream) near the castle a solution which was violently criticized on arch itectonic and aesthetic grounds. In the meantime the authorities were working on new traffic routes in the form of bridges and tunnels and on a general plan for both Stockholm and the neighbouring municipalities.

Stocks and Bonds

Three distinct major movements took place in the U.S. stock market during 1937–46. The first of these occurred during 1937 and 1938 when stock price averages reached their highest level since 1932 namely in March 1937. Then followed an extraordinary collapse during the last half of the year. This drastic decline continued during the first half of 1938 but that years price range ended at about the same level as prevailed at the close of 1937.

The second major stock market movement extended from 1939 to 1942 inclusive. The four years were childrenized by comparative dullness and a continuing low level of prices for all groups of stocks the average price remaining at approximately the low level reached at the close of 1937 and 1938.

The third outstanding period of the decade commenced in 1943 and extended to the middle of 1946. It was a more or less consistent bull market for nearly four years with the average price level of all groups of stocks at the middle of 1946 well above the high level reached in March 1937.

Decline of 1937-38 - The outstanding development in the US stock market during 1937 was a generally drastic decline in the price level for all groups of stocks For all the major classes of stocks the record for March 1937 represented the highest monthly price level since the bottom depression figures of June 1932 Near the close of March the security market commenced to waver By August the decline had assumed large and rapid propor tions From September to November inclusive the decline took on the proportions of a collapse Railroad stocks from March to December were cut in half the average price level (Standard Statistics company figures) declining from 648 to 326 Industrial stocks declined during the same period from 174 6 to 106 4 public utility stocks from 918 to 609 and copper and brass stocks from 2540 to 1292 The combined average for the first 3 groups of stocks-railroads industrials and public utilities compris ing a total of 90 stocks-declined from 143 7 in March to 875 at the end of the year In fact, there were few instances on record where a larger percentage decline had been experienced within so short a time

Following the close of 1937 the decline continued further

until the middle of 1938 although with a much smaller momentum. R ulroad stocks reached a June level in 1958 of 227 industrial stocks of 975 in May public utility stocks of 559 in June and copper and biass stocks of 1036. Thereafter the market steaded and rose moderately until the Dec. 1938 price levels were approximately those of Dec. 1937. The railroad December stock level of 1937 was 326 compared with 307 for Dec. 1938. The industrial stock level for Dec. 1937 was 1064 compared with 1258 for 1938 the public utility stock level 609 compared with 627 and the copper and brass stock level 1292 as compared with 1555

The above figures are an average for the month based on daily closing prices except for copper and brass which are weekly closing prices (Source of data—Standard Trade and Securities Statistical Bulletin—Standard Statist cs company Inc.)

During the first quarter of 1937 market sentiment was extremely optimistic and market actions seemed to indi cate that the nation was emerging definitely from the 1930-36 depression The bull market was stimulated by (1) the prospect of greatly increased production to fill the large backlog accumulated during depression years (2) exceedingly low money rates and the large volume of lendable funds (3) the great demand of foreign buyers for US securities (4) the increasing development of foreign markets (5) the better balance obtained between agricul ture and industry and (6) the more hopeful outlook rela tive to the balancing of the federal budget. By the close of March however, and continuing all through the re mainder of the year as well as during 1938 news and happenings of a very disturbing nature seemed to over whelm market sentiment. War in Europe and the pros pects of US involvement filled the newspapers from day to day. All through the year 1937 basic industries were also blocked with labour upheavals causing widespread disorganization as well as severe financial loss. Corpora tions felt more and more the burden of taxes levied on their undivided profits and capital gains. Increasingly it also became apparent that the national budget could not be balanced with a resulting spectie of a further increase in tax buidens. Government ciedit policies also tended to tighten credit. Moreover, many political measures were either launched or threatened which involved an unset tling influence upon business until the measures could be finally disposed of

Price Levels—Averages published by the Standard Statistics company showed that a representative list of 20 railroad stocks rose from 58.8 for Jan 1937, to a high for the year of 64.8 in March. Thereafter a decline occurred almost uninterruptedly month after month until a low of 32.6 was reached for December. This average compared with 47.0 for Jan 1936 and with a yearly average of 26.8 for 1932 the bottom depression year. For Jan 1938 the average stood at 31.5 for June a low for the year of 22.7 was reached, while by December a recovery was made to 30.7

A representative list of 50 industrial stocks experienced an increase from Jan. 1937 to March 1937, of from 168.0 to 174.6. Thereafter a decline occurred, again almost uninterruptedly month by month, until a low for the year—106.4—was reached in December. This low average may be compared with 129.1 for Jan. 1936, and with 53.5, the yearly average for 1932. By May 1938, the average had declined further to 97.5. Thereafter the monthly average moved back and forth, although with an improving tendency, until the closing December average stood at 125.8.

Twenty representative utility stocks slumped from 100.9 for Jan. 1937, to 60.9 for December. The decline was almost uninterrupted throughout the year. The low of 60.9 may be compared with 88.4 for Jan. 1936, and with a yearly average of 85.7 for 1932.

A representative list of 7 copper and brass stocks underwent a decline during the period March-Dec. 1937 from 254.0 to 129.2, or nearly 50%.

The combined average for the first 3 groups of stocks—railroads, industrials and public utilities, comprising a total of 90 stocks—showed a decline, during March—Dec. 1937, from 143.8 to 87.5. or nearly 40%. During 1938 this combined average declined further to an extreme low of 78.5 for April. Thereafter a gradual improvement occurred until a December average of 100.7 was reached.

Doldrums, 1939-42.-For a four-year period, following 1938, the stock market remained comparatively dull and steady. Major price trends showed many fluctuations, both bull and bear, but all were comparatively small in scope as compared with the major movement of 1937, and nothing of a sensational nature occurred marketwise in any one of the four years covered by this period. From an overall standpoint during the four-year period, it may be said that the market assumed a creepingly lower tendency. In other words, the main force of the bear market had spent itself during 1937 and 1938, but a somewhat further downward drift was experienced during the following four years of 1939-1942. Most of the leading groups of stocks ended with an average December level in 1942 of from 8.1% (railroads) to 44.3% (public utilities) under the December average of 1938.

Price Movements of Important Groups.—Averages published by the Standard Statistics company showed that a representative list of 20 railroad stocks began 1939 with a January average of 31.3, then declined to 26.8 for May, and subsequently rose to 31.7 for December. In 1940 the monthly average declined from 31.2 for January to 22.1 for June, and subsequently rose to 28.4 for December. During 1941 the monthly average rose from 29.8 for January to 30.3 for August, and subsequently declined to 24.9 for December. In 1942 the monthly average declined from 28.1 for January to 24.0 for June, and subsequently

closed at 28.2 for December. This December average of 28.2 for 1942 compared with a December average of 30.7 for 1938, a decline of 8.1%.

A representative list of 50 industrial stocks began 1939 with a January average of 122.5, then declined to 105.2 for April, and subsequently rose to 120.2 for December. During 1940 the monthly average declined from 119.0 for January to 93.0 for June, and thereafter closed at 103.0 for December. The next year, the monthly average declined from 102.6 for January to 92.4 for May, and subsequently declined further, closing at 88.2 for December. In 1942 the monthly average declined further from 89.2 for January to 79.0 for April. Subsequently the average closed at 96.5 for December. This December average of 96.5 for 1942 compared with a December average of 125.8 for 1938, a decline of 23.2%.

Twenty representative public utility stocks started 1939 with a January average of 66.6, then declined to 62.1 for April, and subsequently rose to 68.5 for December. In 1940 the monthly average started with 70.4 for January, then declined to 56.8 for June, and later declined somewhat more to 53.8 for December. In the following year, the monthly average declined from 55.0 for January to 44.4 for May, and subsequently rose and declined at intervals until the December average stood at 34.3. During 1942 the monthly average declined from 35.4 for January to 28.8 for April, and thereafter rose slightly to close at 34.9 for December. The December average of 34.9 for 1942 compared with a December average of 62.7 for Dec. 1938, a decline of 44.3%.

A representative list of 7 copper and brass stocks started with a monthly average of 145.6 for January, then declined to 114.0 for May, and subsequently closed at 141.3 for December. In 1940 the January average was 134.3; thereafter a decline occurred to 92.3 for July, while the close for December showed a rise to 125.7. During 1941 the January average was 86.9 (a new base, using 1935–39 as a base period, having been adopted by the Standard Statistics service). Thereafter a decline occurred to 78.5 for April, while the December close stood at 71.6.

The combined average for the first 3 groups of stocks—railroads, industrials and public utilities, comprising a total of 90 stocks—stood at 99.3 for Jan. 1939, then declined to 89.2 for May, and subsequently rose to 98.2 for December. For 1940 the January average was 97.7; thereafter a decline reached bottom in June at 76.8, while the December close stood at 83.7. The year 1941 began with a January average of 83.8, followed by a May low of 74.9, and a December close of 69.5. During 1942 the January average stood at 70.9, followed by a decline to 62.2 for April, and a subsequent rise to 75.6 for December. The December average of 75.6 for 1942 compares with a December average of 100.7 for Dec. 1938, a decline of 24.9%.

Economic Factors.—The gradually declining seesaw market of 1939-42 was largely the outgrowth of conditions

Copper and brass figures from 1941 on use 1935–39 as a base period. All other figures use 1926 as a base period. The dobug figures are an average for the month based on daily closing prices, except for copper and brass, which are weekly closing prices. (Source of data—Standard Trade and Securities, Current Statistics, Standard Statistics company, Inc.)

resulting from World War II. The first of these years showed an overall improvement in business of about 18% as compared with the close of 1938, thus causing many to believe that the stock market had failed to keep pace with business conditions. However, the actual outbreak of war in Europe was a new factor of importance. War scares were frequent during the early months of the year and were possibly responsible for the marked decline from January to April, inclusive. When World War II finally became a reality, the market seemed to have discounted the momentous event, and exhibited a remarkably steady tendency. In this respect, the stock market's actions were very different from those at the outbreak of World War I, when chaos resulted with news of the commencement of war and all stock exchanges had to be closed for a fourmonth period.

During 1940 despite the war news from both a national and an international point of view, stock movements, as in 1939, were in no sense extraordinary. The whole year's showing was rather surprising in view of the substantial enlargement of business activity caused by large war orders and the initiation of a huge national defense program. Probably the continued absence of substantial market movements was attributable to the fact that fundamental conditions affecting business had not changed materially. The burden of taxation upon corporations, an unbalanced national budget and a rapidly growing national indebtedness seemed to indicate in 1940 every prospect for further extensions. Increased volume of business, in other words, was counterbalanced by the fear of possible price restrictions and general governmental regimentation of business.

As was the case during 1940 market movements in 1941 were again distinctly and gradually downward, despite the tremendous enlargement of business activity occasioned by war orders and the exceptional earnings of larger corporations. All through the year the market seemed to be influenced by fear and indecision. Apparently the market was discounting future prospects and, therefore, remained uninfluenced by current improved volume of business and earnings. As in 1939 and 1940 the market lethargy and general price decline was largely attributable to a huge increase in the tax burden and the fear of governmental regimentation. But a new factor was increasingly entering the economic picture, namely, the prospect of inflationary tendencies with their increased cost of raw materials as well as increased labour costs. Despite war psychology and war controls, the year was marked by constant labour troubles. Moreover, there was a marked trend toward the adoption of priorities in business and of price restrictions. A considerable amount of selling in the stock market also had for its motive the establishment of losses for income tax deductions.

Rarely had annual stock market price fluctuations, as well as the annual volume of transactions, been smaller than in 1942. Strange as it may seem, this unusual record

occurred despite momentous developments of a domestic and international character. Neither war events, favourable and unfavourable, nor extraordinary domestic news with respect to the dislocation of industry, the imposition of greatly increased taxes and the introduction of rationing and other control systems, seemed to have any real effect, except momentarily, upon either the price level of stocks or bonds or the volume of transactions. Nor did the market respond to the splendid earnings of corporations and the payment of large dividends. Instead it continued low and dull, despite the fact that for many of the listed issues of common shares, the dividend distribution to stockholders during the year equalled an 8% to 10% return on the prevailing market price.

Bull Market of 1943-46.-Although stock market price movements for the year 1943 were somewhat more extensive than was the case during 1942, the fluctuations were comparatively small considering the extraordinary economic events occasioned by World War II. As was the case during 1939-42, the market as a whole seemed largely unaffected by war events or economic happenings. However, the year was quite consistently a moderate bull year, in marked contrast to the creeping seesaw downward trend of prices during 1939-42. During 1944 stock market fluctuations were again exceptionally small, as was also the volume of trading. But the year was again marked by an upward trend, the various groups of stocks showing an appreciation for the year, as compared with 1943, of about 7.3% for railroads, 8.2% for industrials, 11.3% for public utilities and 8.2% for all three groups combined.

Compared especially with 1944 and 1943 the 1945 U.S. stock market was decidedly different with respect to (1) much greater activity, (2) a much higher price level, (3) a much greater continuity of trend and (4) a more vigorous extension of the bull market to all leading classes of stocks. In fact, the 1945 market may be described as an active bull market throughout the year (following the milder bull market of the preceding two years), with only one brief period of moderate decline in the middle of the year. At the end of December, railroad stocks showed an appreciation of 17.4% more than 1943, industrial stocks an appreciation of 38.2%, public utility stocks 28.1% and copper and brass stocks 41.5%. For all of the first 3 leading groups, the appreciation amounted to 33.6% as compared with a rise during the same period of 1944 of only 8.2%.

The vigorous bull market of 1945 was continued during the first six months of 1946. By June of that year the monthly average stood at 66.1 for the railroads, 177.8 for the industrial group, 94.5 for the public utilities group and 139.7 for the copper and brass group. This rise represented another appreciation for these groups respectively of 3.1%, 6.8%, 12.4% and 10.6% more than the averages of Dec. 1945.

Copper and brass figures use 1935-39 as a base period. All other figures use 1926 as a base period. The above figures are an average for the month based on daily closing prices, except for copper and brass, which are weekly closing prices. (Source of data—Standard Trade and Securities, Current Statistics, Standard Statistics company, Inc.)

Price Movements of Important Groups.—Averages published by the Standard Statistics company showed that 20 representative railroad stocks began 1943 with a January average of 30.2, then rose to 39.4 for July, and subsequently declined to close at 35.0 for December. During 1944 the monthly average rose from 32.3 for January to 42.7 for July, and subsequently closed at 46.6 for December. In 1945 the monthly average rose further from 49.3 for January to 58.6 for June, and closed with a December average of 64.0. The vigorous bull market of 1945 was maintained during the first 6 months of 1946, the monthly average standing at 66.7 for January and 66.1 for June. The January average of 66.7, the highest level for the 3½ year bull market, compared with the December average for 1942 of 28.2, an increase of 136.5%.

The representative list of 50 industrial stocks began 1943 with a January average of 101.8, then increased to 122.5 for July, and subsequently declined slightly to close at 113.8 for December. During 1944 the monthly average increased from 117.4 for January to 128.5 for July. Thereafter the monthly average held without substantial change until the December average stood at 128.5. In 1945 the monthly average rose further from 131.8 for January to 145.2 for June. Subsequently the monthly average fluctuated somewhat, but the December average reached the high figure of 166.7. This average continued to rise during the first 5 months of 1946, the figure rising from 172.8 for January to 179.8 for May. The latter average, again the highest level for the 31/2 year bull market, compared with the December average for 1942 of 96.5, an increase of 83.5%.

Twenty representative public utility stocks started 1943 with a January average of 38.2, then rose to 51.4 for July, and subsequently declined slightly to 48.9 for December. During the year 1944 the monthly average started with 50.2 for January, then increased to 55.4 for August, and thereafter held to the end of the year, when the December average stood at 55.1. In the following year, the monthly average rose from 57.7 for January almost uninterruptedly to a December close for the year of 83.2. This average increased further during the first 6 months of 1946, the price level rising from 88.5 for January to 94.5 for June. This figure of 94.5 compared with the December average for 1942 of 34.9, an increase of 170.8%.

The list of 7 representative copper and brass stocks started 1943 with a January average of 75.2, then increased to 85.8 for April, and thereafter declined to 72.7 for December. In 1944 the January average was 75.2, thereafter increased to 80.2 for July, and subsequently fluctuated up and down until the December average stood at 84.8. During 1945 the January average was 91.2, an increase subsequently occurred to 97.2 for June, and subsequently a further increase took place to 126.3 for the closing month of December. During the first 5 months of 1946, the average rose from 132.2 for January to 142.8 for May—again the highest level for the 3½ year bull market, comparing with the December average of 71.6 for 1942, an increase of 99.4%.

The combined average for the first 3 groups of stocks—railroads, industrials and public utilities, comprising a total of 90 stocks—stood at 80.2 for Jan. 1943, then increased to 98.1 for July, and subsequently declined to 91.2 for December. For 1944 the January average was 94.1. Thereafter an increase occurred to 103.2 for July, and this level was substantially maintained until December, when the monthly average stood at 104.2. The year 1945 began with

a January average of 107.1. Thereafter an increase occurred to 119.8 for June, and subsequently a further increase to 137.6 for December. The December average of 137.6 for 1945 was further increased during the first 5 months of 1946, rising from 143.1 for January to 148.5 for May, as compared with the December average for 1942 of 75.6, an increase of 96.4%.

The bull market of 1943-46 apparently had ended by June 1946. Following that month a very drastic decline occurred, especially alter August. The decline was so large as to raise the question of whether the stock market had not discounted a serious letup in business. Railroad stocks, using the Standard Statistics company figures, declined from a June average of 66.1 to a September average of 48.3, or 26.9%. Industrial stocks during the same period declined from 177.8 to 145.9, or 18%; public utilities from 94.5 to 75.5, or 20.1%; copper stocks from 139.7 to 109.2, or 21.8%; and the first 3 groups combined from 147.6 to 119.9, or 18.8%.

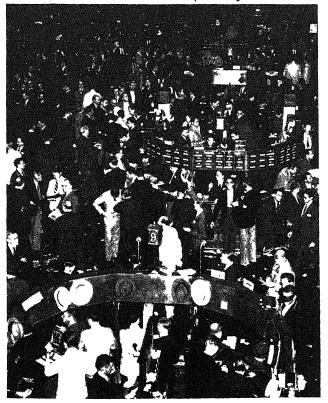

Market Factors.—The year 1943 could be regarded as the first conservatively bull stock market year since the break of 1937. New economic factors began to assert themselves, as compared with the preceding four-year period, namely, heavy emphasis concerning the prospects of inflation, as well as the expected high postwar activity to meet depleted backlogs of needed goods, repairs and new construction.

During 1944 the market at all times seemed to visualize an early termination of hostilities and the gigantic problems that would ensue. Price movements, therefore, were hesitating in character, and indicated an extremely cautious financial sentiment and unusually selective buying. On the bull side of the market, emphasis was given to large earnings and the resiliency of industry to withstand high taxes, the prospect of at least a temporary high postwar activity to meet the greatly depleted backlog of consumer goods and deferred repairs and construction, and the likelihood of the elimination of governmental price and other economic restrictions. On the bear side, emphasis was given to the rapidly mounting federal debt, the likelihood of continued high taxation, the costly problems of reconversion of industry to a peacetime basis, the loss involved in the renegotiation and termination of war contracts, the drift toward inflation and increasing production costs and the prospect of greatly increased labour troubles when strikes no longer would seem inconsistent with the war effort. The attempt to balance these two groups of opposite factors very likely led to the cautiousness of market speculators and their inclination to remain conservative as speculators on the bull side of the market.

Market factors of 1945 influencing the stock price levels were again exceedingly numerous. On the bull side, ten considerations seem to have been stressed by the speculative community, namely: (1) a strong undercurrent of inflation thinking, (2) an enormous pressure of idle funds seeking investment, with outright purchases the general rule, (3) a diminution of investment bond issues owing to large refunding operations, (4) continued low interest yields on choice bonds with a much larger yield obtainable from stocks, (5) favourable corporate earnings and increased dividend declarations, (6) federal tax legislation reducing corporate taxes materially, (7) better prospects for utility shares, resulting partly from tax redemptions and partly from a likelihood of more liberal recapitalization plans for common stockholders, (8) a belief by many in a huge postwar boom to meet the needs of foreign nations as well as domestic depleted backlogs of goods, repairs and badly needed new construction, (9) the hope of abolition of price and other economic restrictions with the close of hostilities and (10) a feeling that stocks were not too high, despite their substantial rise, in view of the devalued dollar (devalued by nearly 40% in 1933). Unfavourable market lactors were also plentiful, such as (1) continued heavy government deficit spending, (2) a substantial business reaction from excessive war activity, (3) a faltering reconversion of business to peacetime conditions, (4) a substantial increase in production costs, as well as a distinct trend toward higher living costs and (5) an enormous increase in strikes throughout the nation, with the automotive and steel industries paralyzed, and with a threatened stoppage of numerous other basic industries. For the time being, however, all these ominous factors seemed to be ignored by the stock market. Bad news, especially strike news, seemed to be geared to a further appreciation in stock values. Increasingly the inflation and boom psychologies seemed to brush all unfavourable factors aside and more and more to hold the market within their grip.

Toward the middle of 1946, however, bear considerations clearly gained the upper hand. Continual strikes throughout the country in nearly all leading industries made it more and more apparent that the anticipated postwar boom would not materialize immediately. Moreover, the numerous wage increase victories of labour were not accompanied by a compensating increase in prices for producers. Disappointment over the inability of leading corporations, especially the automotive industry, to get back to profitable production became increasingly keen to the thinking public. Moreover, the apprehension caused by stymied foreign policy indications, and the prospects of serious trouble with U.S.S.R. also shared in the undermining of confidence and the bringing about of the sharp market break following June 1946. Economic enterprise was also impeded by numerous serious shortages in steel scrap, freight cars, etc.,

Traders on the floor of the New York Stock exchange shortly before the outbreak of war in Europe during 1939

and by great uncertainties concerning cost price relations and corporation taxes.

Market Values.—Using the figures of the New York Stock exchange, the total value of listed shares on the New York exchange stood at \$66,864,000,000 on Oct. 1, 1946, and \$69,561,000,000 on Nov. 1, 1945. This value compared with \$53.087,000,000 on Nov. 1, 1944, and for the corresponding period, with \$45,101,000,000 for 1943, \$37,374,000,000 for 1942, \$37.882,000,000 for 1941, \$41,848,000,000 for 1940, \$45.500,000,000 for 1939, \$46.081,000,000 for 1938, \$40,716,000,000 for 1937 and \$62,618,000,000 for March 1937, the high mark before the bear market of 1937–42 began its course. During 1946 the total value was increased to \$74.350.000,000 on Sept. 1, highest during the ten-year period under consideration.

Volume of Transactions.—Stock transactions on the New York Stock exchange during the decade 1937–46 showed a condition of unusual dullness. This was particularly true of all years except 1937, 1945 and 1946. For 1937 total sales on the New York exchange amounted to 409,468,885 shares, and for 1945 to 377,563,575 shares. For all of the intervening years the total fell below the 300,000,000 share mark, and for the 3 years 1940–42, the total stood respectively at only 208,000,000, 171,000,000 and 126,000,000. These totals seemed extremely small when compared with former totals of 1,125,000,000 shares for 1929, the highest on record, with 920,000,000 and 810,000,000 for 1928 and 1930, and with 655,000,000 and 496,000,000 for 1933 and 1936. For 1946 the total was 363,709,312.

On the New York Curb market, the second largest stock market in the western hemisphere, the showing was similar to that explained for the New York Stock exchange. Here again the largest volume of sales occurred in 1937 (with 104,000,000 shares) and 1945 (with 143,000,000 shares). For all other years the market was comparatively dull, with 1944 and 1943 alone showing sales of 71,000,000 shares, and with 1942 and 1941 dropping to the low totals of 22,000,000 and 34,000,000 shares, respectively. Even the 1945 total of 143,000,000 shares seems small when compared with the 1930 volume of sales of 220,000,000 shares, and the 474,000,000 shares of 1929, the largest on record.

The Bond Market.—Unlike the stock market, the U.S. bond market of 1937–46 may be discussed as a single entity. Throughout the decade, bonds sold at an extremely high price level. Variations were comparatively small, with the exception of 1937, and the price trend was a gradually rising one.

Using the Standard Statistics company barometer figure for composite bonds (average for each month based on daily closing prices), the average high price for Jan. 1937. stood at 100.7, and thereafter declined to 83.6 in December. This December high level held substantially for the following 3 years, namely, 82.2 for 1938, 82.6 for 1939 and 84.4 for 1940. Thereafter the index was changed to a new basis. For 1941 the monthly high index for January was 99.87. Each succeeding year recorded an increase, namely, to 100.3 (January high) for 1942, and for the corresponding month, to 106.4 for 1943, 113.4 for 1944, 117.6 for 1945 and 120.2 for 1946. For Dec. 1946 the high average stood at 116.5.

1937–40 Daily Bond Price Indexes-60 Bonds Composite
1941–46 Daily Index of Medium and Lower Grade Bonds—Composite
(Source of data—Standard Trade and Securites, Current Statistics, Standard Statistics company, Inc.)

Using Moody's Bond Price index, the rise for "Aaa bonds" extended from a high average figure of 118.16 for 1937 to 126.61 for 1940. Thereafter a decline took place to a high average of 117.20 for 1942. Subsequently the price rise was resumed, extending from 119.41 for 1943 to 124.20 for 1946. United States government bonds showed an almost steady rise throughout the decade, from 112.78 (January high) for 1937 to 126.28 for 1946. During the decade, bond yields also showed a substantial decline. According to Moody's Bond Yield averages, the yield on the "Aaa group" of bonds declined from 3.47% for 1937 to 2.58% for 1946, whereas the yield on the "Aa group" declined during the same 10 year period from 3.60% for 1937 to 2.66% for 1946. On government bonds the yield, according to this index, declined from 2.13% for 1941 to 1.54% for 1946.

Factors Influencing Bond Prices.—Reasons for the huge ise in bond values during the decade 1937–46 were essentially three: (1) enhanced safety of bonds because of the improved solvency status of the issuing corporations, (2) the relative scarcity of available bonds, occasioned partly by rapidly growing investment funds on the part of depository institutions as well as individual investors, and partly by vast bond retirement and refunding operations by corporations and (3) an extraordinary decline in interest rates. The last two factors were the most important. Sound bond investments, when measured by the huge funds seeking investment, became acutely scarce. More-

over, interest rates sank to an extremely low level. Throughout the decade, time money rates for prime commercial paper (using New York as a basis) ranged between 0.75% and 1.00%, and call loans remained consistently at 1.00%. Owing largely to governmental policies, lunds for business purposes seemed to be a drug on the market; hence the unusual demand for high grade bonds on the part of nonspeculative investors, despite the declining yield.

Number and Value of Bond Issues.—According to

the N.Y. Stock exchange's compilation, the total market value of bonds listed on that exchange stood at \$41,612,-000,000 on Jan. 1, 1937. By Dec. 1, 1937, this market value had declined to \$39,000,000,000. Subsequently the market value figure (Dec. 1) rose gradually to \$50,000,000,000 for 1938, \$48,000,000,000 for 1939, \$51,000,000,000 for 1940, \$55,000,000,000 for 1941, \$63,000,000,000 for 1942, \$91,000,-000,000 for 1943, \$102,000,000,000 for 1944, \$139,000,000,-000 for 1945 and \$141,000,000,000 for Aug. 1, 1946. The enormous increase in the aforementioned figures was largely attributable to the issue of huge amounts of United States government securities. The New York Stock exchange's average bond price for Jan. 1, 1937, was given as 100.76 and for Dec. 1 of that year as 92.36. Thereafter a slight decline occurred to 91.24 for Dec. 1, 1939. Following 1939 a consistent rise took place, namely, to 93.58 (Dec. 1) for 1940, and for the corresponding date to 94.80 for 1941, 96.11 for 1942, 99.02 for 1943, 100.71 for 1944, 103.16 for 1945 and 103.52 (Aug. 1) 1946.

There was also a noticeable decline in the number of outstanding bond issues listed on the New York Stock exchange. Whereas the number of issues during 1938–40 was consistently near 1,400, that figure declined to 1,273 in 1941, 1,142 in 1942, 1,098 in 1943, 1,058 in 1944 and 946 in July, 1946. As already explained, bond issues became relatively scarce, owing to the large bond retirement and refunding operations of corporations.

Volume of Transactions.—Throughout the decade the volume of bond transactions was comparatively meagre. Only 1943 showed bond sales on the New York Stock exchange exceeding \$3,000,000,000. During 1938 and 1940 sales fell to the extreme low level of \$1,859,000,000 and \$1,671,000,000 respectively. For all other years the annual

				To	ы	e١	/III.—Bonds Traded o	on the New	York	St	ock	Exc	hange

total of sales ranged from a minimum of \$2,048,000,000 in 1939 to a maximum of \$2,790,000,000 in 1937.

U.S. Stock Exchanges.—The 1937–46 chronology of the New York Stock exchange's alterations in its rules and practices embraces an exceedingly large variety of subjects.

Governmental Reorganization.—In 1942 the governmental setup of the exchange was materially altered. The board of governors was reduced from 32 to 25; all standing committees were abolished; the rule-making powers of the committees were transferred to the board of governors and the election of the nominating committee was set to be held at the same time as the election of governors. The objectives of the change were "to establish the board of governors as the exchange's sole policy making body; to centralize administrative authority in the president and to provide the constitutional framework for a competent, responsible and representative government of the exchange."

In passing judgment upon the appropriateness of advertising, the committee on public relations of the exchange announced in 1939 that it was "pursuing a liberal, realistic policy and that its philosophy permitted all reasonable latitude."

Announcement was also made in 1939 of the establishment of panels of 504 business and professional men in Baltimore, Boston, Chicago, Los Angeles, Philadelphia, Pittsburgh, Richmond and San Francisco from which arbitrators might be drawn in cases involving members of the public.

Requirements Designed to Protect Public.-In 1939 new rules were adopted whereby the capital requirements of member firms doing a general business with the public were increased by 25%. Aggregate indebtedness of a member firm could not exceed 1500% of its net capital, whereas previously such indebtedness was limited to 2000% of net capital. In the same year all firms were required to make available to customers "on request a statement of financial condition as of a date within four months prior to such request," and notice of such availability must be sent to customers. Following this requirement, the exchange also installed a complete revision of its audit requirements in 1940. Later in 1942 the Securities and Exchange commission (SEC) adopted a rule "requiring all registered brokers or dealers dealing with the public, to file, on a standard type financial questionnaire, annual audit and financial reports with the commission." Mention should also be made of the ruling of the SEC restricting the use of customers' securities as collateral (effective Feb. 17, 1941). According to this ruling, "brokers and dealers are prohibited from commingling securities of different customers as collateral for loans without the customer's consent; from commingling customers' securities with their own securities under the same pledge; from pledging customers' securities for more than the amount the customers owe them." These new rules were designed to give customers added protection against loss in the event of brokerage failures.

Trading Procedures.—Five important actions affected trading procedures, as follows:

- (1) The order of the SEC (Oct. 4, 1941) to the exchange "to amend its constitution, effective Oct. 6, to make clear that members of the exchange would not be prevented from acting as odd lot dealers or specialists upon regional exchanges in securities listed on the New York Stock exchange."
- (2) Adoption of a "special offerings" plan, effective Feb. 16, 1942, providing for "the marketing on the floor of the exchange, by announcement on the ticker tape and by payment of a special commission, of blocks of listed securities

which could not readily be absorbed in the auction market within a reasonable time and at a reasonable price."

- (3) Adoption of an experimental trial (in 1942) to "determine if dealings in a selected list of stocks in units of trading smaller than 100 shares at active posts would improve the market for such issues." Later in the year 28 stocks were selected to be traded in units of 10 shares at active posts 1 to 15 inclusive. The purpose of the move was to see whether specialists might be able to make better markets and thus attract business away from the over-the-counter market.
- (4) Issuance in 1937 of a detailed set of instructions to specialists with reference to dealings on the floor of the exchange in stocks in which they were acting as specialists.
- (5) Adoption of rules (July 15, 1939) prohibiting general partners of member firms, doing a margin business with the public, from trading on margin.

Margin Requirements.-On long accounts the margin requirement was reduced to 45°_{0} in 1937 and on short sales to 50%. Effective March 1, 1943, purchases of securities selling at less than 5 could be on a cash basis only. In 1944 margins on "when issued" and "when distributed" securities were made equivalent to margins on issued securities. In 1945 the federal reserve board announced that the margin for the purchase of registered securities would be increased to 50%. In the same year the board of governors of the exchange amended its margin requirements "to provide for 100% margin on securities selling at or less than 10; a minimum of S10 a share on stocks selling at more than 10; 10% of the principal amount of any bond selling at more than 10% of its principal amount and a minimum margin account equity of \$1,000." On July 5, 1945, the federal reserve board again increased margin requirements for the purchase of registered securities from 50% to 75%, and also applied this same margin to short sales. Later the margin requirement for both purchases and short sales was increased to 100%.

Commission Rates.—Effective Jan. 3, 1938, 3 important changes in commission rates were approved: (1) a new schedule for commissions, increasing non-member commissions by an estimated 11% and member rates by 5%; (2) permission to members also holding membership on another exchange to charge whatever rates of commission might be prescribed by the other market and (3) the establishment of a service charge on inactive accounts. In 1941 commissions and clearing charges for United States government bonds and New York city corporate stock were reduced by 50%. Later in the same year "the odd lot differential on stocks selling at less than \$1 and more than 1/8th would be increased from 1/16th to 1/8th." For stocks selling at 1/8th or less, the differential, in order to cover expenses, was placed at half of the selling price. On Feb. 26, 1941, the exchange adopted an amendment "raising minimum non-member and member commission rates approximately 25% and 10% respectively."

Listing Requirements.—In 1939 listing fees were revised, involving a reduction in the initial fee on stock from \$120 to \$50 per 10,000 shares, a 15 year annual continuing fee of \$75 per 100,000 shares for the first 2,000,000 shares, and \$50 per 100,000 shares in excess of 2,000,000 shares; and a reduction from \$120 to \$60 per \$1,000,000 principal amount in the listing fee for short term bonds.

In the same year, announcement was made of a policy (1) to place "emphasis upon national interests and quality rather than upon size as a test of listing eligibility," and (2) to delist any stock issue whose outstanding shares

available for trading had become reduced to approximately 2 000 shares, or in the case of bonds to \$200,000 par amount

The exchange announced in 1940 that new preferred stock should not be listed unless the stock provided at least the following minimum voting rights (1) the right of the stock, "voting as a class, to elect not less than two directors after default of the equivalent of six quarterly dividends," and (2) 'affirmative approval of at least two thirds of the preferred stock, voting as a class, as a pre requisite to any charter or by law amendment altering materially any existing provision of such preferred stock."

In 1942 the exchange suggested to the presidents of listed corporations "that their inventory policy be disclosed in annual reports to stockholders". The exchange trans mitted a bulletin prepaied by the Committee on Accounting Procedure of the American Institute of Accounts which "discussed special reserves made necessary by wartime conditions". During the following year the exchange requested that presidents of listed corporations report to stockholders any effect that renegotiation settlements might have on the operating figures. The exchange likewise suggested to listed corporations "that stock dividends received not be recorded as income and that stockholders be notified of the amount of earnings or earned surplus capitalized by stock dividends when issued by a corporation".

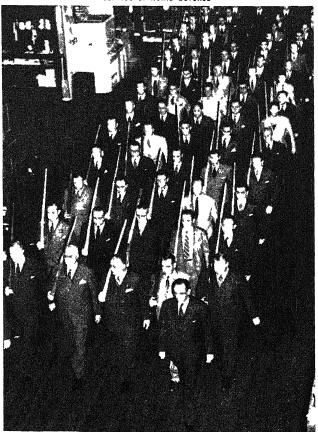

Supervision of Short Sales -On Jan 24 1938 the SEC ruled that, effective Feb 8 no person could make a short sale, other than in odd lot transactions, "at or below the price at which the last sale thereof, regular way, was effected" The previous rule effective since 1931, provided that "short sales could be made below the last sale" On May 25 the above mentioned change was enlarged by a ruling of the board of governors to the effect that "a short sale in an odd lot must be based upon a round lot sale at a higher price than the last round lot sale" In 1939 effective March 20, the SEC further amended its short selling rules 'to permit a short sale at the price of the last sale provided the previous different sale was lower than the last sale 'Bona fide international arbitrage trans actions, however were exempted from price restrictions upon short selling

Stock Transfer Taxes - During the decade, frequent ap peals were made for relief from the high state stock transfer tax, with respect to both the amount and the inconvenience of collection On April 24 1942, New York passed the Coudert Mitchell bill eliminating the double taxation on odd lot transactions a distinct benefit to investors In the following year (April 20, 1943) New York adopted legislation eliminating the requirement that brokers affix tax stamps to transferred securities. Instead, registered stock exchanges or affiliated clearing corporations were authorized to collect the tax, thus relieving brokers of the necessity of maintaining large stocks of stamps, paid in advance Similarly, on Oct 15 the federal bureau of internal revenue arranged to have the payment of federal transfer taxes made by the stock clearing corporation, instead of by the use of stamps by each member firm Effective July 1, 1945, New York state revised its stock transfer tax rates "to eliminate the emergency rate and to provide a graduated scale of charges of from one cent to four cents a share, depending on the selling price. Previous rates provided for a charge of three cents a share for stocks less than \$20 and four cents for stocks \$20 and more These rates included a one and one-half cent and 2 cent per share emergency rate, respectively"

It will be noted that many of the changes effected during the decade were ordered by the SEC, and numerous com plaints emanated from the exchange indicating that the burden and detailed character of government supervision was becoming increasingly apparent. Moreover, the presi dent of the New York Stock exchange reported in 1937 that "evidence accumulates that the quality of the market has been affected With much concern I note the continu ance of narrow illiquid markets in which wide spreads be tween bid and asked quotations prevail and in which comparatively small volumes of buying or selling create undue fluctuations in prices" That statement was inter esting in the light of the report of the Trading and Exchange division of the SEC in Jan 1945, proposing to prohibit floor trading by members of the New York Stock exchange and the New York Curb exchange. To that pro posal the president of the New York Stock exchange replied that "adoption of the rule might amount to a major surgical operation upon one of the most delicately adjusted segments of our national economy."

Great Britain and Europe

The history of stocks and bonds in Great Britain and Europe in the period 1937-46 was a reflection of the political strife that culminated in war. World War II was already beginning to cast its shadow over the financial scene as early as 1937, and so far as Great Britain was concerned the needs of financing of rearmament and, later, of the war itself at the lowest possible cost completely dominated the British market.

British Cheap Money Policy.-Up to 1986 a stock exchange boom had been in existence which had been touched off psychologically in 1932 by an event which was to have a major influence on stock and bond values throughout the years 1937-46. In June 1932 Neville Chamberlain, chancellor of the exchequer, announced the conversion of 5% war loan, 1929-47, into 31/200 war loan, 1952, or after. More than £1,910,670,000 was converted into the new loan, representing more than 1/4 of the total amount of British government securities then quoted on the London Stock exchange. The general effect on all government and kindred securities was dramatic. At the end of 1931 interest yields on quoted irredeemable British government securities ranged from $4\frac{1}{2}\%$ to nearly 5%; gross redemption yields from $4\frac{3}{4}\frac{6}{6}$ to more than $6\frac{6}{6}$; and the 3 months' treasury bill rate averaged over 31/2% discount. At the end of 1932 after the great war loan conversion, interest yields on quoted irredeemable British government stocks had fallen to $3\frac{3}{8}\%$ to $3\frac{1}{2}\%$; gross redemption yields to $1\frac{1}{4}\%$ to $3\frac{5}{8}\%$; and the treasury bill rate for the year to just more than 1.65% discount. The era of dear money which began with World War I had ended, and the era of cheap money had been ushered in. The latter proved to be independent of politics and probably owed its continuing impulse throughout 1937-46 to a fixed treasury policy, acceptable to different governments. Because of it, a later chancellor of the exchequer, Sir Kingsley Wood, was able to boast, in 1943, that the colossal war borrowing was being carried out at an average rate of interest of 2% per annum, with a net cost of only

1% after allowing for income tax.

The political events of 1937–39, leading up to World War II, greatly strained the treasury's ability to maintain the cheap money policy. Unlike the period from 1939, when a closed economy existed because of the treasury ban on purchase of securities abroad by United Kingdom residents and on new capital issues, external influences operated to affect government credit. In 1937 Europe seemed on the brink of war on more than one occasion. There was a heavy fall in all security values on the London Stock exchange, including those of the government and industrial companies, reflecting not only the approaching world disaster but also a recession in industrial activity. The rearmaments race was gathering momentum, and the government announced it would spend £1,488,834,000.

The position worsened in 1938; the business recession was not arrested until the spring. Sterling weakened in the international markets, and stability was not reached until Sept. 1939 when the sterling-dollar rate was pegged on the basis of 4.02-4.06 to the £ sterling.

Between 1937 and 1938 the total of government loans issued to the public was only about £179,901,000, with a

somewhat smaller increase in the amount of three-months' treasury bills issued. The deterioration in the effectiveness of the cheap money policy may be appreciated from the fact that between 1937 and 1939 the treasury bill rate had more than doubled and in 1939 averaged, over 1.2% discount, and that to attract subscriptions the terms of the only government stock issued in 1938—£81,000,000 of 3% National Detense loan, 195.1–58, issued at 98%—had to be fixed to show a gross redemption yield of nearly 3.15% per annum. This was a retrograde step; at the end of 1936, a loan of similar currency had been floated with a gross redemption yield of 2.85%. Municipal loans, originally issued in many cases at an interest rate of 6%, were converted into 3% loans.

With the declaration of war on Sept. 3, 1939, the cheap money policy of the British treasury, operating within a closed economy, entered into its own again. On Aug. 24 the bank rate had been raised from 2°0 to 4°0 as a precautionary measure, and minimum prices, below which dealings on the London Stock exchange could not take place, were fixed for British government and kindred securities. The government's announcement on Sept. 1 of a £496,278,000 credit for war purposes gave an inkling of the volume of borrowing to come. Temporarily, the market in British government securities became frozen, but following the restoration of the bank rate to 20%, and a plentiful supply of funds as government war spending got under way (note circulation and bank deposits reached successively higher records), the market became unfrozen and showed a sharply rising trend which persisted, with interruptions, until the end of 1946.

The British treasury found its keenest advocate for its cheap money policy when the Labour government came to power in 1945 and Hugh Dalton was appointed chancellor of the exchequer. Dalton was responsible for the outstanding event of 1946 in the market for government securities, with an issue of a "tap" loan of 21/200 savings bonds, 1964-67, at par. Holders of maturing National war bonds, 1946-48, accepted conversion into the new loan to the extent of £327.543,400, and £418,362,200 of new subscriptions were received. This loan may be said to have consolidated the ground gained throughout the previous ten years, and to have formally established British government credit over a period of 18-21 years on a 21/200 basis. The advantages were extended to municipalities and public boards, which under the sponsorship of the treasury were able to place loans on similar terms.

Indeed, the effects of the cheap money policy were felt throughout the whole range of securities in Great Britain. The continuous fall in prior charges and ordinary shares (and rising yields) of British industrial companies from 1937 until June 1940, when the trough of the slump was reached, was due initially to fears of war, then to the outbreak of war and finally to fears of a stalemate result at best following the British army's evacuation from Dunkirk and the air onslaught on Great Britain. The steady recovery in share quotations to a level which approximated to the peak of the 1936 loan owed its origin to the favourable turn in the war fortunes of the United Nations, to the satisfactory earnings of industrial companies because of war spending, and, later, to prospects of a return to peacetime trading and of a reduction of heavy war taxation. It was, however, greatly assisted by the low yields on British government securities which aided the presentation of industrial ordinary shares in a relatively attractive light for income purposes.

*Approximate figures only: there is no obligation on members of the London Stock exchange to make an official record of transactions.

The industrial share index reached a low wartime level of 61.1 on June 26, 1940.

Public Issues.—The British government's borrowing program, which resulted in public issues, including those to government departments, of more than £8,436,725,000 during World War II, did not really get under way until 1940. It was then evident from the terms of the new issues that the treasury intended to finance the war at low rates of interest. The war's first "tap" issue-a stock which remained open for subscription at the issue price at the Bank of England, usually for a considerable periodwas made. This was a loan of short currency, a 21/200 National war bond, 1945-47, issued at par. Lists were opened on June 24, 1940, and were not closed until Dec. 31. Subscriptions of more than £440,695,000 were attracted. Altogether, the device of the "tap" at the Bank of England as a means of mopping up surplus funds in the hands of the public, was used on 10 occasions during World War II, resulting in the subscription of some £6,352,109,000. This was, in fact, the chief means employed to obtain public subscriptions for new loans of various kinds.

The 3% war loan, 1955-59, a stock which was to become one of the leaders of the market for British funds, was also issued in that year; £302,233,250 was subscribed. Although public loans totalling only £741,439,200 were issued by the government during 1940 (excluding £243,176,000 of conversion loan, 2%, 1943-45), this was by no means the extent of government borrowing. It is sig-

nificant that at the end of the financial year 1936-37 the proportion of the national debt in 3-months' treasury bills was less than 9%; by the end of 1939-40, the proportion of a rising debt had increased to about 15%, and was later to exceed this ratio.

Short-Dated Securities.-Throughout World War II the short-dated security, bearing a low rate of interest, was the principal weapon in the British government's armoury, not only for absorbing surplus funds in the banking system and thus limiting inflationary trends, but also for financing the war cheaply so far as interest was concerned. Between 1937 and 1946 the total of treasury bills in issue increased more than fivefold. For the greater part of the war the 3-months' treasury bill rate was about 1% discount. In Oct. 1945 when the cheap money policy drive was intensified, the rate was reduced to 1/2%. Two other important short-term bonds were issued by the government during the war at low interest rates. In July 1940 the treasury asked for 6-months' deposits from the banks at an interest rate of 1.125% per annum. Receipts, known as treasury deposit receipts, were issued, and the banks were assured of their liquidity by the undertaking of the Bank of England to discount them at bank rate (2%.) Another short-term instrument used for war finance and which had a value as an anti-inflationary device was the tax reserve certificate. This was created in the latter part of 1941, and was in reality a means of anticipating tax payments, which were becoming heavy following big government spending and the rise in the level of taxation. Taxpayers were invited to buy certificates at par, bearing an interest rate of 1% per annum, free of any kind of tax. These could be surrendered against liability for incometax (Schedule E) and other taxes, as well as War Damage act contributions.

European Stocks and Bonds.—With Europe the centre of the political maelstrom, it was inevitable that the market for foreign bonds should have been distressed, a condition which lasted in varying degree, dependent on the country concerned, until the end of 1946. In 1937 Germany's internal economic difficulties were growing, so much so that free dealings in foreign stocks and bonds in Germany were forbidden by decree. Germany maintained the service of the Dawes and Young loans, however, although holders of state and municipal issues continued to receive interest payments in funding bonds. Both Poland and Hungary reduced rates on high-interest-bearing bonds to $4\frac{1}{2}\%$. Following the nazi coup in Austria in 1938, Germany recognized the Austrian debt, but reduced interest

rates generally, including those on the German Dawes and Young loans. The credit of Hungary, Bulgaria and Rumania as foreign borrowers was temporarily raised by improved debt offers, but the beginning of World War II and invasion by Germany in 1940 destroyed the security behind most European bonds, which slumped to nominal prices on the London market.

Postwar Europe as a Debtor.—The external debt service of most European countries remained in abeyance throughout World

Stone, Harlan Fiske

Stone (1872–1946) US jurist, was born Oct 11, 1872 in Chesterfield, NH He received a BS degree from Am herst college, Amherst, Mass, in 1894, then turned to the study of law, taking his LLB from Columbia university school of law in 1898. He entered private practice, then returned to Columbia as professor of law in 1902. In 1910 he was made dean of the law school, but resigned in 1923 to return to private practice. The next year, President Calvin Coolidge appointed him attorney general of the United States. On March 2, 1925, Coolidge named him associate justice of the US supreme court. On the court bench he frequently sided with the minority reports of

Oliver Wendell Holmes, Louis D. Brandeis and Benjamin Cardozo and was known with these other eminent jurists as one of the "great dissenters" Up on the retirement of Charles Evans Hughes as chief justice, Stone was appointed in June 1941 to that post He died at Washington DC, on April 22 1946

Stone

The production and uses of stone in the United States are shown in the ac companying table. To make the record complete, there is added to the data on the stone industry proper, the outputs of limestone used in making cement and lime, of asphaltic stone and of slate.

The World War II construction program increased the consumption of stone for building and paving, which reached a peak in 1941, declining in later years to 1945. While the postwar building revival doubled the demand for dimension stone in 1945, crushed stone continued to decline; there must have been an increased use of crushed stone in concrete aggregate for building in

1945 but presumably the rise was more than offset by a continued decline in paying

In comparison, other uses of crushed stone showed con tinuing increases beyond the break in demand for construction stone

Industrial uses reached a peak in 1943, the year in which production in general caught up with war demands food requirements remained high, and in agricultural uses the peak was postponed until 1944, with only a small decline in 1945

That the load on the railroads did not end with the close of the war was evidenced by the annual increases in the demand for railroad ballast, with a 16% rise in 1945 over 1944.

It should also be noted that stone was an important factor in munitions production, this was especially true of limestone, used as flux in metallurgical furnaces and in the production of calcium carbide the source of acetylene for welding

Dolomitic limestone and sandstone were used as a refractory in furnaces and the former as a source of magnesite and magnesium (G A Ro)

Strategic Bombing

The theory and practice of strategic bombing began in World War I, but did not advance beyond the rudimentary stage. The aeroplane had not then developed sufficient load capacity to serve as a decisive offensive weapon. It was used mostly for reconnaissance and for tactical support of armies, with only experimental air effort applied to strategic objectives.

The weapons then available for surface war favoured defense, as against offense. As a result, the western front remained comparatively stationary for the greater part of four years, "the blood-bath of positional war." Superiority of defense was a concomitant of the relative immobility of firepower entrenched behind barbed wire. Land offensives were restricted by the lack of a mobile armoured weapon. This deficiency was characteristic of surface war of the period, in which the opponents were relatively equal and similar in manpower, distribution, weapons and mobility. The objectives, of necessity, were limited to the deleat of the immediate military forces in the field and the progressive seizure of space. The tank, a mobile and offensive weapon, was not effectively employed until the final phase. ("The Black Day For The German Army," according to German authorities, was Aug. 8, 1918, when the British launched their co-ordinated tank offensive.) The only other means to force the enemy's collapse in two-dimensional war was the external blockade, to deprive him of outside sustenance.

The consequence of the superiority of defense resulting from immobility of firepower was that World War I, despite the many attacks and counter-attacks, remained a stalemate "in the mud" until the closing months, when U.S. reinforcements upset the balance between the opposing forces. The inescapable high cost of successful land offensives predetermined the outcome of a war of attrition; the side with the greatest resources in manpower and matériel, including food, would emerge victorious. Germany was conquered, but not invaded, during the period of combat. Under pressure of external blockade, Germany's "home front" collapsed, leaving its armies without support and therefore with no recourse but surrender. The "home front" was the Achilles heel.

The conclusion seemed plausible that constant increase of firepower, mounted in defensive works, would insure the continued superiority of defense over offense, given equality of forces engaged, and provided the "home fronts" remained unbroken. In the following years some authorities enunciated this dictum as an incontestable military doctrine. Its physical expression was the Maginot line, the classical pattern for a stalemate war.

The offensive character of the tank was a challenge to the idea of impregnable defense in that it increased the mobility of firepower, but within the limits imposed by its two-dimensional movement in surface warfare. Some new capacity was necessary.

Airmen believed that the aeroplane, operating in three dimensions, could not only give greater mobility to the offense, but also could break the deadlock of positional war by its capacity to maintain an *internal* blockade on the enemy's "home front."

The clue to this undeveloped capacity lay in the relatively insignificant experience with strategic bombing in World War I. Bombing operations were carried out with slight success by both sides in 1916. The German attacks on London in the summer of 1917, however, pointed to

the strategic offensive potentials of the air weapon. These attacks led to the creation of the royal air force as a separate service and to the establishment (within the R.A.F.) of a special bombing force, the independent air force, for direct action against the heart of the German industrial system. General Jan C. Smuts, in recommending air operations independent of the army and navy to the war cabinet, Aug. 1917, declared: "aerial operations . . . may become the principal operations of war, to which the older forms of military and naval operations may become secondary and subordinate." The independent air force dropped 543 tons of bombs on Germany in 1918, causing 2,589 casualties and damage amounting to \$6,000,000. These operations by light aeroplanes were small compared with those of World War II, but they did demonstrate the efficacy of the strategic air offensive.

Prophets of the offensive use of air power included Marshal of the Royal Air Force Lord H. M. Trenchard; Winston Churchill, British minister of munitions, 1917; Brig. Gen. William Mitchell, U.S. army air corps; and Gen. Giulio Douhet, Italian air force, author of *The Command of the Air* (1921). The R.A.F. staff college and the U.S. army air corps tactical school locused attention on the necessity for a new means of offense to reach the vital centres of an enemy's war production. From these studies there was gradually evolved a new concept, based on the capacities of the aeroplane.

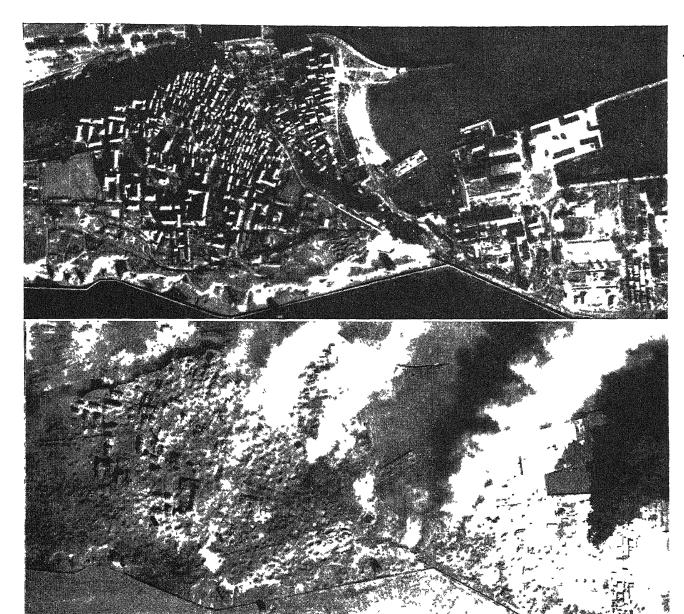

The aeroplane was not limited by geography, except for its requirement of surface bases. Its one serious limitation, weather, could be mastered by man's ingenuity in making and using electronic instruments. The aeroplane came from anywhere; it went everywhere.

The basic problem in designing a decisive service weapon is the necessary compromise between the contradictory imperatives of firepower, mobility and protection (armour). In general experience, one of these is achieved in a weapon only at the sacrifice, to some degree, of the others. The aeroplane is peculiar in that it not only harmonizes the three imperatives, but combines them to a high degree. Its firepower is measured by the allotment in its load capacity to armament and bombs, allowance being made for fuel and crews. It has unprecedented mobility in three dimensions. Speed and altitude are its principal armour. Its offensive character is determined by the extent of its radius of action, and by power of penetration equal to its reach. These qualities made the aeroplane a decisive weapon of a high order.

The mobility of the aeroplane vastly extended the reach of firepower, and created a new large-scale capacity for offense. It brought the enemy's "home front" within immediate range during hostilities, thus altering the meaning of time and space in war operations. This capacity was the basis for changing the concept of war from limited conflict between aimed forces in the field (nations in arms) to all-inclusive combat between the total human and material resources of the opposing nation-structures.

The ultimate national aim of all military action is to break the enemy's power and will to resist. Before proceeding to this ultimate objective, surfaces forces are obliged to attain a limited, intermediate objective—the defeat of the corresponding type of hostile force, the enemy's body muscles on the periphery of his strength.

Air power, on the other hand, acts not only against the corresponding hostile air force, but against all the hostile forces, land, sea and air. In addition, by reason of its power for offensive penetration, it proceeds to direct assault on the ultimate unlimited objective of all forces—the enemy's national will, his "home front," his heart,

Heligoland fortress shown before and after a single attack by R.A.F. bombers on April 18, 1945

brain and vitals, at the very core of his existence.

Concept of Strategic Air Offensive.—The nine fundamental principles of war (U.S. war department, 1921) were evolved during centuries of surface warfare, and were considered immutable. But air power was without the guidance of precedents for application of its peculiar capacities. The concept of the strategic air offensive could be stated in terms of the nine immutable principles, regiouped under the three headings: objective, means, application.

Objective.—In executing the national war aim of breaking the enemy's will to resist, an power may be employed to attack the hostile air, land and sea forces, or to attack the enemy's national structure, depending on the enemy's most vulnerable sources of strength. Against a heavily industrialized enemy, its maximum contribution to the national war aim is through strategic effort. It thus has both a mission which is sometimes co-ordinate, and sometimes subordinate, to the land and sea forces, and an independent mission of its own.

Its tactical mission is the destruction of military forces. Maintenance of air cover over the surface forces by bombers and fighters includes preparation for surface advance by assault on enemy ships, troops and supply lines; local control of the air; isolation of the battlefield; and airborne operations.

The independent strategic mission is destruction of warmaking capacity. The main targets of an air offensive are not the enemy's military forces in the field, but his arsenals, essential war industries, transport systems, communications, fuel supplies and other elements sustaining the national will on the "home front," including civilian morale. A primary purpose is to destroy the enemy's capacity to create war power and to maintain the battle. These vital objectives had formerly been accessible on a decisive scale only at the end of successful surface campaigns. They could be reached by air power regardless of the tide of surface battle, or even when surface forces were not engaged.

Systematic destruction of the enemy's sources of war power on the "home front" breaks his will to resist through paralysis of his means. To the indirect, external blockade

is added a direct, internal blockade which disrupts his means of sustenance inside the area occupied by his military forces and population. In a condition of progressive strangulation of his war effort, he loses capacity to maintain the battle and is forced to collapse from within. This assault on the whole national structure is the peculiar capacity of air power and its dominant mission in war.

Means.—The means for fulfilment of the strategic concept of air power are organized air forces, adequately equipped with aeroplanes of various types with the speed, range and firepower necessary to execute their particular missions. Auxiliary instruments include bomb sights, navigational aids, radio, aerial cameras, etc. The national sources of supply must be adequate to build and maintain the air forces and to replace battle wastage of manpower and matériel.

Application.—The application of air power includes those principles of war not listed under the objective. A special requirement is advance knowledge of the targets most vital to the enemy's war effort. These are selected from available intelligence sources, and confirmed by aerial photography.

The principle of offensive is inherent in the aeroplane; it cannot remain still. The methods of the offensive are attrition, destruction, external and internal blockade and capture. Security, in combat and at the base, is achieved by control of the air, gained by progressive destruction of the enemy's air force in the air and on the ground and stoppage in factories of his replacement capacity. The offensive for control of the air in its early stages parallels the strategic mission, as an air force on the defensive can be forced up to engage in combat by bombing "sensitive" targets. Control of the air is essential to freedom of action of all forces, land, sea and air. When the enemy's air resistance has been neutralized to the point where he can not effectively intercept strategic missions, the degree of air control advances to air supremacy which, if maintained, is tantamount to victory.

Air power achieves the principle of mass more effectively than any other armed power. By its extreme mobility, it attains an unprecedented concentration of force over single targets from bases separated by hundreds, and eventually thousands, of miles.

Economy of force is the efficiency which results from accurate bombing of the primary objective with the least expenditure of manpower and equipment and by avoidance of dissipation of strength on secondary operations. Air power is not committed to position in battle; its units retire to base to prepare for renewal of the assault. The rapid turnaround schedules permit a high degree of sustained effort on targets marked for destruction.

Movement is characterized by high flexibility in the tactical manoeuvres of combat and in employment. Strategic air forces may be used tactically; tactical air forces may be used strategically. Any component, within the limits of its capabilities, may be shifted from one target to another, from one type of operation to another or from one theatre of war to another in shuttle operations. High flexibility is a dominant characteristic of air power.

Surprise is elemental in air warfare. The enemy can never be certain of the target selected for attack. Feint attacks, camouflaged efforts and changes in direction are possible while missions are in flight. Diversionary missions cannot be evaluated in time to take successful countermeasures.

Simplicity, through unity of command, is a prerequisite

of the air offensive to insure integration of effort under the principle of mass. Co-operation is attained between strategical and tactical air forces, between bombers and fighters and between the air and surface forces by careful observance of timing. Co-ordination among the air, land and sea forces is achieved through a supreme commander and the over-all offensive plan.

The combination of new medium, new capacity for offense and new concept of total war, enabled airmen to raise their sights over the traditional line-of-war to the enemy's war capacity in the rear. By its ability to utilize increased firepower to enlarge rather than reduce the mobility of armed forces, air power abolished the stalemate of positional war. By its independent strategic mission to force collapse of the national structure, it could shorten the term of hostilities. As the new and supreme instrument of national will, air power altered the dynamics by which nations at war survive.

Strategic Employment of Air Power.-The concept of strategic air offensive was not given an adequate tryout until the final year and a half of World War II. Air operations between the two world wars (against the native tribes of the middle east, against China and Ethiopia and in the Spanish Civil War) were necessarily tactical because of the lack of strategic targets in such areas. The Germans, in preparing for World War II, designed a large air force for tactical support of fast-moving ground troops, without an independent strategic mission of its own. They had not developed the strategic concept. Their bombers (Ju-88, H-111, Do-17) were inadequately armed. They used their fighters defensively in close support of the bombers instead of offensively in general support. Because of faulty concept, the luftwaffe failed to concentrate primarily on the R.A.F. and subsequently on industry and ports. They were unable to establish control of the air against the eight-gunned British fighters (Spitfire and Hurricane), aided by the warnings of secret radar. Consequently, despite the Germans' numerical superiority, their air offensive in the battle of Britain, 1940, was doomed to failure.

The royal air force did have the strategic concept, but its available bombers were inadequate for the mission. Its daylight raids on German targets in 1940 resulted in prohibitive losses. The R.A.F. bomber command was forced into night bombing from 1940 onwards. It was not until 1942 that the development of radio navigational aids and the improvement of four-engined bombers (particularly the Lancaster) made the night operations of R.A.F. bomber command demonstrably effective in destroying German war capacity. The British heavy night bomber, which sacrificed defensive armament to bomb load, was successful to a limited degree while operating unsupported in its strategic tasks by U.S. heavy day bombers; it remained the greatest load carrier of the war in Europe. With its new equipment and more effective technique for concentration, the R.A.F. bomber command, commanded by Air Chief Marshal Sir Arthur T. Harris, was able to begin mass attacks on the concentrated German industries (the first mission was over Cologne on May 20, 1942, when 1,043 bombers dropped 2,000 tons in 90 minutes). Subsequently, R.A.F. area bombing became the night shift in the round-the-clock strategic Allied air offensive; in smashing Germany's national structure, it had the effectiveness of a titanic sledge hammer. Later, because of improved techniques in aiming, night bombing from medium altitude by the R.A.F. achieved degrees of accuracy and economy of force unsurpassed by other forms of air attack on specific and individual targets.

Shortly after World War I, U.S. air leaders began to

formulate ideas for the correct methods of using air power as the new decisive instrument in war. These ideas, expressed in lecture form at the tactical school, gradually assumed the status of air doctrine—the basis of the U.S. version of the strategic concept.

The strategic plans of the U.S. army air force envisaged precision bombing from high altitudes in daylight, aided by an improved bomb sight. The prohibitive losses incurred by the German and British daylight missions were to be prevented by more and heavier guns on the bombers and the use of tactical formations in combat to gain an intense concentration of protective firepower.

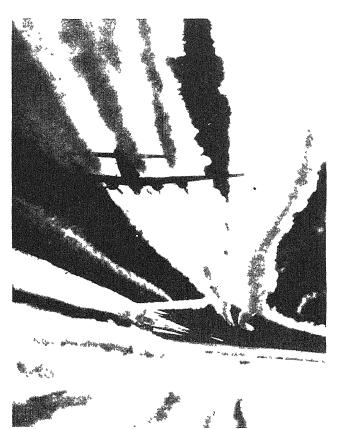

At the moment of Pearl Harbor, the U.S.A.A.F. confronted war in Europe and the Pacific without the means of putting its concept into operation. It did have the advantage of time to prepare while the Allies maintained the battle; of an enormous national industrial establishment for forging the weapon; and of a vast reservoir of U.S. youth capable of being trained in air techniques.

During the ensuing two years the U.S.A.A.F. under the command of General H. H. Arnold, built the striking force necessary to execute the concept. Its strength, which was 43,118 personnel and 2,546 aeroplanes in 1940, was expanded to 2,300,000 total personnel and 80,000 aeroplanes in early 1944. Technical training was necessary in the organization of air and ground crews, as well as in intelligence and target analysis, radio, tactical air doctrine, etc. Mastery of the new technique kept pace with production of the weapons-the B-17 and B-24 heavy bombers and the P-38, P-47 and P-51 fighters for escort. The first heavy bombing unit of the 8th air force arrived in Great Britain on June 10, 1942. The first mission of the 8th bomber command was an attack by 12 B-17s on the Rouen marshalling yards, Aug. 17, 1942. On the following day, U.S. fighters, P-38s, made their first sorties.

Day bombing was tentative and experimental until the Casablanca directive, issued by the combined chiefs of staff, Jan. 21, 1943, sanctioned the "destruction and dislocation of German military, industrial, and economic system, and the undermining of the morale of the German people to the point where their capacity for armed resistance is fatally weakened." To implement this directive there was drawn up "the combined bomber offensive plan" based on an operations analysis report. This plan, also called "pointblank," was approved by the combined chiefs of staff on June 10, 1943, and issued to the air commanders of the R.A.F. and the U.S.A.A.F. The order of target priorities established were: (1) submarine construction yards and bases; (2) aircraft industry; (3) ball-bearing industry; (4) oil industry; (5) synthetic rubber plants; (6) military transport vehicle industry. This order of priorities changed as the air offensive progressed.

During 1943 the 8th air force carried out strategic missions with insufficient force to insure control of the air over the targets. Losses threatened to become prohibitive. The development of long-range escort, by installing additional fuel tanks in fighters, solved this problem and permitted deeper penetrations. By the end of 1943, the 8th air force attained the necessary build-up of strength for effective execution of its strategic mission. The advance of the Allied forces across North Africa to Italy led to activation of the 15th air force on Nov. 1, 1943, with bases in the Foggia area. This made possible the co-ordination of bombing attacks from two theatres on the same German targets, implementing the principle of mass.

The co-ordination of the strategic bombing effort by the 8th air force, commanded by Lt. Gen. James H. Doolittle, and the 15th air force, commanded by Maj. Gen. Nathan

Vapour trails behind a fleet of B-17 Flying Fortresses on their way to bomb railroad yards at Linz, Austria, Jan. 8, 1945

F. Twining, was the function of the headquarters of the U.S. strategic air forces, established in Great Britain Jan. 6, 1944, under the command of Lt. Gen. Carl Spaatz. These air forces were in two theatres of operations, the European under General Dwight D. Eisenhower and the Mediterranean under General Sir Henry Maitland Wilson. The reach and power of the strategic air arm had not made sufficient impact on the thinking of military strategists to cause organization of theatres of war in conformity with the capability of the most elastic, far-reaching powerful weapon. Under this condition, the difficulties of operating the U.S. strategic air forces in Europe were greatly augmented. However, by frequent conferences between General Spaatz and Lt. Gen. Ira C. Eaker, commanding general of the Allied air forces in the Mediterranean who had administrative control of the 15th air force, wholehearted co-operation and effective co-ordination of effort was obtained. Co-ordination within U.S. Strategic-Tactical Air Forces was attained by appointment of two deputy commanding generals, Maj. Gen. F. L. Anderson, operations, and Maj. Gen. Hugh J. Knerr, administration (sup-

The absolute necessity for furtherance of the Anglo-U.S. strategic mission and of preparations for surface invasion of the continent was control of the air over Germany. This could be won only by cutting off the replacements of the German air force and by fighting its existing force out of the sky. The rising scale of R.A.F. night bombing of industrial concentrations, augmented by U.S. daylight attacks, led to German countermeasures. In 1942 the Germans began dispersal of aircraft factories to the deep interior. They planned to quadruple their monthly output of single-engined fighters by April 1944. The 8th air force

began its offensive for control of the air by an attack on the Focke-Wulf plant at Bremen, April 17, 1943. On six successive days of late July, it attacked the German aircraft industry so successfully that the production curve, which had attained double the output of 1942, was turned downward. The climax came in late Feb. 1944 (the "big week"), when during six days of perfect weather the R.A.F.-U.S.A.A.F. team dropped 16,506 tons of bombs in a series of attacks on the German aircraft industry. These fatally reduced its replacement capacity.

German aircraft production subsequently recovered; but the Allies retained control of the air during the remainder of the war.

The combined chiefs of staff retained final control of strategic bombing in Europe throughout the period of hostilities after the United States's entry into the war. Until April 14, 1944, their designated agent in exercise of control was Air Chief Marshal Sir Charles Portal, who as chief of air staff was ipso facto a member of the combined chiefs of staff. From that date until Sept. 15, 1944, the strategic air forces were placed at the disposal of the supreme commander, Gen. Eisenhower. During this period (operation "Overlord") they were used to prepare for and support the surface invasion of the continent. Co-ordination between the tactical and strategic air forces was effected by the deputy supreme commander, Air Chief Marshal Sir Arthur Tedder, as representative of Gen. Eisenhower. On Sept. 15, 1944, the strategic air forces reverted to the direct control of the combined chiefs of staff. Air Chief Marshal Portal and Gen. Arnold were designated joint agents, with Air Marshal Sir Norman Bottomley and Gen. Spaatz charged with co-ordination in the field.

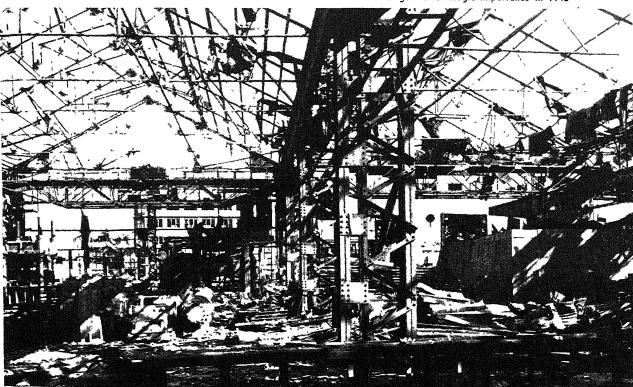

From April 1944 onward the immediate objectives were transportation systems, with increasing effort assigned to synthetic oil production and other strategic targets of a vital nature. Total German production and imports of oil dropped from 918,000 tons per month in the first quarter of 1944 to 319,000 tons in the last quarter, a decline of two-thirds caused preponderantly by the attacks of the strategic air forces. The effect of the oil shortage was catastrophic for all the German armed forces. The German ground troops literally ran out of oil in the battle of the Bulge, beginning Dec. 16, 1944. Destruction of the German oil supply was the climactic fulfilment of the strategic air offensive in Europe. By Feb. 1945 most of the remaining aeroplanes of the German air force, including the newly developed jet-propelled, were pinned to the ground by lack of fuel. Consequently, the Allied strategic air forces could attack at will, with negligible loss, any part of Germany's armed forces or national structure selected for destruction.

Total air supremacy was achieved over the whole area of the European war.

On April 16, 1945, orders were issued to the strategic air forces as follows: "The advances of our ground forces have brought to a close the Strategic Air War waged by the United States Strategic Air Forces and the Royal Air Force Bomber Command. It has been won with a decisiveness becoming increasingly evident as our armies overrun Germany. From now onward our Strategic Air Forces must operate with our Tactical Air Forces in close cooperation with our armies."

Until the arrival in sufficient numbers of very heavy, long-range bombers, the B-29s, the air mission in the Pacific was tactical support of the navy and the amphibious forces. The objectives were Japanese land, sea and air forces, and islands which were utilized as bases as the offensive of all arms closed on Japan proper. The strategic mission began in the summer of 1944 with small attacks on the industries of Japan by B-29s based in China. Attacks

Site of a former machine tool plant in the Osaka-Kobe area left virtually stripped by the pounding of B-29s aiming at Japanese targets of strategic importance in 1945

of similar weight were begun in Nov. from the newly acquired bases on the Marianas. The necessary control of the air had already been won. On March 9, 1945, Maj. Gen. Curtis LeMay, commanding general of the 21st bomber command (the striking force of the 20th air force, then commanded by Gen. Arnold from Washington, D.C.) initiated the all-out mass offensive by low-level incendiary attack. The U.S. army strategic air forces, under the command of Gen. Spaatz, was activated July 11, 1945, with headquarters at Guam. The attacks on Japan continued at accelerated frequency and unbearable intensity. The dropping of the two atomic bombs, one on Hiroshima Aug. 6 and the second on Nagasaki Aug. 9, merely served as justification for the capitulation, Aug. 14, by the government of a nation long since defeated. A surface invasion proved unnecessary. For this reason the air offensive against Japan was the classic prototype of fulfilment of the strategic concept in World War II.

In its strategic effort (1942–45) the U.S.A.A.F. expended 1,050,710 U.S. tons of bombs against Germany and 179,967 tons against Japan. In similar operations the R.A.F. bomber command expended 989,320 U.S. tons against Germanv (1941–45) and 13,730 tons against Japan (1943–45). Both air forces expended considerable additional tonnage in tactical operations of the air war. The combination of bombing by day and by night round-the-clock sulfilled the Casablanca directive of the combined chiefs of staff, Jan. 1943 (see above).

The two following extracts serve as over-all assessment of the strategic air war (from the Over-all Report [European War], of the United States Strategic Bombing Survey, Sept. 30, 1945):

"Allied air power was decisive in the war in Western Europe. . . . In the air, its victory was complete; at sea, its contribution, combined with naval power, brought an end to the enemy's greatest naval threat—the U-boat; on land, it helped turn the tide overwhelmingly in favor of Allied ground forces. Its power and superiority made possible the success of the invasion. It brought the economy which sustained the enemy's armed forces to virtual collapse, although the full effects of this collapse had not reached the enemy's front lines when they were overrun by Allied forces. It brought home to the German people the full impact of modern war with all its horror and suffering. Its imprint on the German nation will be lasting."

From the Summary Report (Pacific War) of the United States Strategic Bombing survey, July 1, 1946:

"The physical destruction resulting from the air attack on Japan approximates that suffered by Germany, even though the tonnage of bombs dropped was far smaller. The attack was more concentrated in time, and the target areas were smaller and more vulnerable. Not only were the Japanese defenses overwhelmed, but Japan's will and capacity for reconstruction, dispersal, and passive defense were less than Germany's. . . .

"The time lapse between military impotence and political acceptance of the inevitable might have been shorter had the political structure of Japan permitted a more rapid and decisive determination of national policies. Nevertheless, it seems clear that, even without the atomic bombing attacks, air supremacy over Japan could have exerted sufficient pressure to bring about unconditional surrender and obviate the need for invasion.

"Based on a detailed investigation of all the facts, and supported by the testimony of the surviving Japanese leaders involved, it is the Survey's opinion that certainly prior to 31 December 1945, and in all probability prior to 1 November 1945, Japan would have surrendered even if

the atomic bomb had not been dropped, even if Russia had not entered the war, and even it no invasion had been planned or contemplated."

* * *

WORLD WAR II was won through co-ordinated effort of all forces, land, sea and air, organized in over-all offensive plans. Air power did not attain its necessary striking potential until the closing 18 months. It was the new instrument of war and became the spark to success of all forces engaged. The national structures of Germany and Japan were disrupted; their defenses saturated; their home fronts dissolved in rubble. This appalling penalty was visited upon nations unable to control the air over their own territories.

Except for the two atomic bombs on Hiroshima and Nagasaki, the bombs carried the conventional type of explosives. A very small percentage of the total tonnage expended, if put in the form of atomic bombs, would have achieved the same results. Carrying a nation's power through the air and applying it to strategic objectives on the enemy's home front, had become the most powerful means to wage war.

Development of the heavy bomber was decisive in the first total war of history. Further evolution of the strategic air concept would include development of guided missiles. The military necessity of the strategic air concept thus epitomized the future issue between possible totality of destruction and the survival capacities of technical civilization. (See also Aviation, Military; Incendiary Warfare: Strategy of World War II; Tactics of World War II, World War II.)

Strategic Mineral Supplies

In 1937 ten commodities of mineral origin were included in the official U.S. Army and Navy Munitions board list of strategic materials—aluminum, antimony, chromium, iodine, manganese, mercury, mica, nickel, tin and tungsten. A number of other materials were considered "critical," that is, probably subject to more or less shortage in supply during an emergency, but it was for only the ten named that real concern was felt. In 1939 there were still ten items in the strategic list, but iodine had been transferred to the critical list, and radio quartz had been added. Also, two-thirds of the former critical list had been dropped to a lower category, under the designation of the control of the designation.

nation "essential," leaving nine members of the critical list—asbestos, cadmium, cryolite, fluorspar, graphite, iodine, platinum, titanium and vanadium.

Long-continued agitation for the stock-piling of strategic materials finally culminated in the passage of the Strategic Materials act of June 1939. However, action had been delayed too long, and by the time specifications could be formulated and purchase arrangements made, war had started in Europe, and with the resulting disorganization of world markets and the channels of international trade, little could be accomplished.

A year later the purchase of emergency stocks was turned over to the Metals Reserve company, a subsidiary of the Reconstruction Finance corporation. Less hampered by red tape, Metals Reserve made much better progress, and in the ensuing years secured a large portion of the metal and mineral requirements for the war program. However, as World War II spread over wider areas and increased in intensity and momentum, it was found that supply requirements which had been considered ample were becoming hopelessly inadequate, and before long the point was reached where the supplies of only gold and lead were adequate to meet demands, and later lead also became short in supply.

Stock-piling.—During the early stages of World War II, in what was still called the defense program, and before the United States became an active belligerent, it was becoming evident that previous conceptions of strategic mineral supplies were inadequate, and long before the war was over it had been effectively demonstrated that the United States could maintain self-sufficiency in few of the many minerals and metals required in such enormous quantities by modern mechanized warfare. This being the case, the only safeguard against critical shortage of supply in any future emergency lay in the advance accumulation of stock piles, to supplement the domestic output and such imports as could be maintained.

When World War II was drawing to a close, it became necessary to look to the future, and make plans for the disposal of the surplus stocks on hand at the end of the war. In order to prevent these stocks from disorganizing postwar markets, and at the same time to start a nucleus of stock-piling for future needs, the Surplus Property act of 1944 provided that all surplus property designated by the Army and Navy Munitions board as suitable for stock-piling purposes should be added to the stock piles authorized by the legislation of 1939, unless needed by industry for current requirements.

Since the stock-piling provisions of the Surplus Property act were scheduled to expire at a specific date, it was necessary that additional legislation be provided if stock-piling were to go beyond this preliminary step. In March 1945 and again in October bills were introduced in congress to provide permanent stock-piling procedure. In the hearings on these bills the chief objections centred on the question as to whether stock pile purchases should be made from domestic or foreign producers, and the methods proposed for the protection of industry against release of stock-piled material, with consequent bad effect on the current market. After much delay the bill was reformulated and passed and approved on July 23, 1946.

The new legislation provided that "the Secretary of War, the Secretary of the Navy, and the Secretary of the Interior, acting jointly through the agency of the Army and Navy Munitions Board, are hereby authorized and directed to determine, from time to time, which materials

are strategic and critical under the provisions of this Act and to determine, from time to time, the quality and quantities of such materials which shall be stock piled under the provisions of this Act." The procurement division of the treasury department was designated as the agency to make the purchases, provide for storage on approved military and naval reservations, provide for any needed refining or processing to put materials in the best form for stock-piling, provide for rotation of the stocks if necessary to prevent deterioration and to dispose of stocks as required by rotation, obsolescence or by revised determinations of requirements. The act also made permanent the temporary provision for transferring surplus war material to the stock pile, and the procurement division handled the materials received by transfer in much the same manner as new purchases. Later, the sum of \$100,000,000 was appropriated by congress for current purchases.

The chief objection to the act was that under pressure from industry the "Buy American" clause was included, giving the output of domestic producers certain priorities over imported materials. This inclusion definitely weakened the protective features of the legislation. The stockpiling of domestic output depleted the already weakened domestic reserves, and contributed nothing to future security except immediate accessibility; hence it should be used only to the extent necessary to keep a marginal industry on a going basis. Only through the stock-piling of imported materials could the available supply be increased.

Army and Navy Munitions Board Report.-In the light of the experience gained in World War II, and under the conditions existing at the end of that war, it was necessary to recast the entire basis of strategic mineral supplies. The Surplus Property act provided that the Army and Navy Munitions board should report to congress its recommendations as to the maximum and minimum amounts of each strategic or critical material that should be included in the stock pile. Similar provisions were incorporated in the Strategic and Critical Materials Stock Piling act of 1946. In accordance with this directive the board made a report in which the necessity for stock-piling was the sole criterion in the determination of strategic materials, and the only differentiation between strategic and critical materials lay in the amounts recommended for the stock pile. All materials which war experience showed to be short in supply were divided into three subclasses, depending on the relative desirability and feasibility for stock-piling, as

A. Those commodities for which stock-piling was considered the only satisfactory way of assuring an adequate supply for future emergency.

B. Materials the stock-piling of which was practicable and acquisition of which was recommended only so far as they might be turned into the stock pile as surplus property, on the score that future supply might be secured by stimulating output from North American sources, or by the use of substitutes.

C. Materials not recommended for stock-piling because difficulties in storage outweighed the advantages of stockpiling.

In its report to congress the board listed 43 items in Group A, 20 items in Group B and 5 items in Group C, a total of 68 items, of which 24 items were different forms or grades of the same 9 basic materials. The last prewar official list (1940) included 9 strategics and 6 criticals in the mineral and metal group; the comparison of this total of 15, against the numbers given above, was a rough measure of the extent to which the status of U.S. strategic minerals had been modified by World War II. (See MINERALOGY.)

Strategic Minerals in Other Countries.-Adequate discussion of the problems of strategic mineral supplies in other countries than the United States was hampered by lack of information. The United States was in a better supply position than any other country and also paid more attention than any other to the means of meeting its inherent shortages in time of emergency demand. At the same time it must be admitted that when the World War II emergency arrived it developed demands so far beyond any that had been anticipated that the supply position proved hopelessly inadequate, and supplementary provisions had to be improvised to meet the needs as they developed. At the end of the decade 1937-46 there was insufficient information available on supply and demand during World War II in other countries to make it possible to say much about the subject except in a general way. However, bearing in mind the experiences of the United States with its superior advantages, one was inevitably led to the inference that supply problems in other countries must have been even less satisfactory. This conclusion was also substantiated by the extent to which others of the United Nations received help from the United States in the way of lend-lease material. In fact, it was the necessity for extending such aid to the Allied nations that caused much of the exaggeration in the war demands in the United States, more than those that had been anticipated.

Prewar Status.—It was difficult likewise to arrive at any effective method of evaluating the comparative status of the various countries with respect to strategic mineral supplies since there was no common factor on which a direct comparison could be made. About the best that could be done was to make a rough appraisal of the self-sufficiency of the various countries with respect to the chief commodities involved in a war program. Table I, adapted from

data of this type compiled in 1939,¹ lists the approximate self-sufficiency of the United States and the 6 other most important industrial nations, with respect to 25 mineral commodities important in the development and maintenance of a war program. This list included 12 nonmetallic minerals and 13 metals for which the relative smelting

Tungsten concentrate in the form in which it is added to steel used in tool making. The only Canadian tungsten refinery, at Ottawa, contributed to the supply of the strategic metal when it became scarce after the fall of Burma in 1942

capacity was also rated. In some cases, a country was rated as having a smelting capacity greater than the corresponding ore-producing capacity, indicating that the smelting capacity was dependent on imported ores to the amount of the difference. In other cases the ore capacity showed a surplus, leaving material available for export. These points were particularly important in time of war, when the country deficient in ore supply might be cut off from imports necessary to make its full smelting capacity effective, while on the other hand the country with surplus ore might not be able to export it. Of these two conditions, the former was of course the more important.

The ratings in the table show the approximate self-sufficiency, or ratio of production to consumption, for the various countries and minerals during the years preceding World War II. While in most cases data of this kind were fairly definite for a particular year, they might vary considerably from year to year; so no attempt was made to classify the ratings more closely than the rough grouping into surplus, adequate and deficient, scaling partial deficiency in thirds. In arranging the table, the minerals in the metallic and nonmetallic groups were listed approximately in the order of increasing deficiency for all countries combined, rather than for any particular country. While this order could not be determined accurately, it still served as a rough relative measure of the over-all strategic importance of the various minerals. While in general the major metals headed the list, and the less common ones followed, the order of importance varied in each country.

Interesting as the comparative status of the various minerals might be, a far more important factor was the comparison of the different countries with each other, since it gave some insight into the question as to the amount of effort required for any country to develop and maintain a munitions program. The attention of the reader is therefore directed to a study of the vertical columns of the table, rather than of the horizontal ones. At a glance it is seen that none of these countries had an adequate supply

¹G. A. Roush, Strategic Mineral Supplies (1939).

of all the minerals listed, and on the other hand, none was deficient in all of them; but the over-all degree of deficiency varied widely. In general, it is also to be noted that self-sufficiency ran higher in the nonmetallic group than in the metallic.

It would not only be interesting, but also extremely valuable, if there were some way in which the various deficiencies could be given a relative weighting and so combined to show a total deficiency factor, but this could not be done. At first glance it might appear that the totals of the different country columns would give a first approximation of a relative factor of this kind, but the ratings on which these values are based are, in the first place, measures of self-sufficiency for ordinary everyday industrial operation, and not for an emergency demand. The countries are listed in the table roughly in the decreasing order of industrial activity; while the totals shown are a rough measure of self-sufficiency for the particular degree of industrial activity of the individual country, a second factor would have to be incorporated to make these figures comparable, taking into account the differences in the magnitude of the industrial activity in the different countries. The totals show that the U.S.S.R. had the best self-sufficiency ratio of the group, so far as its scale of industrial activity went, but that scale of activity was far less than in any of the countries listed in the preceding columns. Then too, the increased activity incident to a munitions program would likely revise many of these factors downward, to an indeterminate but appreciable degree. And finally, to arrive at a factor that would be comparative, it would be necessary to weight each separate commodity according to its value in the program as a whole. From a strategic standpoint the lack of a ton of manganese ore had about the same importance as the lack of 80 tons of steel, since the manganese was required in the production of the steel; or, having both and having the steel made up into finished projectiles, the whole procedure could be made ineffective by the lack of the few ounces of mercury to supply the primers required to make the projectiles function.

It being obviously impossible to develop a directly comparable self-sufficiency factor, investigators were limited to such incomplete data as shown in Table I as a basis for comparison. Furthermore, keeping in mind that these data were all of prewar origin, and the extent to which the United States fell short of expectations under war demands, the situation in the other countries, all of which had greater deficiency lists, must have been considerably worse.

Stock-piling.—Although stock-piling was not officially inaugurated in the U.S. until 1939 (see above), some stocking of strategic materials had been done by industry in the immediately preceding years, but only with a few commodities. On the other hand, there was abundant evidence that stock-piling of some strategic materials, especially manganese ore, was started in Europe almost immediately after the close of World War I. How much, and what materials were stocked, was not known; neither was it known to what extent the stocking was done voluntarily by industry and what part, if any, was fostered by government action. The chief evidence of stock-piling was the importation of commodities in quantities appreciably greater than were currently required by industry. For example, over a long period of years, and beginning as early as 1922, for each ton of steel produced, France imported about four times as much manganese ore as did the United States. There was similar evidence of stock-piling in other coun-

trics, especially Japan, Italy and Germany, during the immediate prewar years. Again using manganese ore as an illustration, world production per ton of steel made was more than a third greater during 1924–37 than it had been during 1911–23, the surplus presumably having gone into stocks in various countries. There were no definite records on the extent of stock-piling during the interwar years, but indications such as those cited above pointed to its rather extensive use. Though limited to a few countries and a few of the more important strategic minerals in the early years, the practice came into more extensive use in the latter 1930s when, in turn, Japan, Italy and Germany were preparing for war. (G. A. Ro.)

Strategy of World War II

Victory in war is achieved through the tactical application of superior military power in proper directions and at the right times and places. The art of developing and applying this power to accomplish national objectives is military strategy. This is a definition dangerously subject to oversimplification. Strategy is ever complicated by obscurity of the enemy situation, by national and international politics, geography, the elements, by technical developments and most important, by unpredictable moral factors, by human strengths, genius and limitations. Once all the complications and difficulties have been resolved by the courage and wisdom of victorious leaders, their strategy will appear simple. However, as Karl von Clausewitz put it, everything in strategy is simple, but not therefore very

Comparison of the opposing forces in World War II and analysis of their employment vividly illustrate all the elements of the preceding definition. Furthermore, the global features of the conflict added greatly to the complexities of evolving and implementing strategy. These difficulties were never fully surmounted by the axis powers, who never achieved a co-ordinated strategy. On the other hand the Allies, particularly the United States and the British commonwealth, did ultimately achieve relatively effective and continuous co-ordination.

In varying degrees the Allies had conflicting political, economic, social and military interests and doctrines and, to some extent, divergent interests regarding the enemy. It should be appreciated therefore that each major decision was not necessarily satisfactory to all the participants, and that complete agreements did not always exist among the war leaders of each nation. Each decision, however, was one which all accepted as effectively leading toward the final goal of decisive victory. That divergent interests were reconciled and an agreed over-all strategy evolved was due to the realization of the overriding importance of inflict-

ing complete deleat upon Germany, Italy and Japan.

In the early stages, an effective tenet of axis strategy was to divide and conquer. The machinery and procedure for Allied co-ordination evolved slowly and did not become reasonably effective until after Pearl Harbor. Eventually the United States and Great Britain developed an effective basis for production and allocation of resources—both human and material. Only very general co-ordination was achieved with the soviet union, and not until late in World War II.

First Phases—Axis Triumphs.—As disciples of Clausewitz, the axis leaders espoused military power as an essential instrument of their expansionist policy. Adolf Hitler, in his early career, defined a specific application of this doctrine when he said, "It is not by flaming protests that oppressed lands are brought back into the embrace of the common reich, but by a sword ever ready to strike" (Mein Kampf, translated by Ralph Manheim, Houghton Mifflin, 1943). Even with Hitler's warning, his intended victims rationalized their estimates in accordance with their desires. The western democracies blindly formed their policies on the unwarranted assumption of continuous peace.

The bloodless occupation by the nazis of the Rhineland, Austria and Czechoslovakia evidenced their early strategy of gaining objectives by the threat of force. The axis success at Munich flowed from axis military power. By Sept. 1939 Germany had "peacefully" enlarged its territory to a relatively broad, productive base for additional expansion and increased its flexibility and potential for surprise action. However, the exasperation and growing fear of other nations had exhausted possibilities of further coups d'état by the mere threat of force.

In Aug. 1939 a trade agreement with the soviet union, followed the same month by a nonaggression pact, effectively divided the nations of Europe and seemed to ensure Germany against a two-front war—the strategic dilemma which Hitler dreaded. Attempts to obtain the Polish corridor by "diplomacy" ended on Sept. 1 when German troops invaded Poland without a declaration of war.

In less than a month, the Polish state was destroyed. Modern equipment and weapons supplied the German commander, Walter von Brauchitsch, the mobility and power to carry out a campaign that overran an entire nation in a few weeks. Manoeuvres which moved rapidly across a nation and would have been strategic in Napoleon's era had become merely battlefield tactics. The principles of war were skilfully and effectively applied to the employment of new weapons and equipment. As many claimed, there was indeed a new face to war—a mechanical face. However, the quality and type of individual genius required behind that face remain unchanged.

Success in Poland greatly improved Germany's strategic position. Elimination of the Polish corridor, acquisition of a frontier further to the east and control of a large portion of the Polish population added to its prestige, resources, depth, flexibility and security. With Poland so quickly eliminated and soviet neutrality virtually ensured, there was little chance that the forthcoming western campaign would suffer, as did Helmuth Moltke's Marne campaign in 1914, by diversions to secure an eastern front.

On Sept. 3, 1939, Great Britain and France, in a belated demonstration of vigorous policy, declared war. However, defensive thinking, feeble Allied preparations and the strength of the German west wall precluded a correspondingly vigorous strategy. As a positive measure, naval blockade produced a limited effect; however, passive measures featured the "sitzkrieg" Allied strategy by which, in 1939 and early 1940, they futilely sought to halt a strong and

clever aggressor.

Much of the iron ore of Sweden, so important to German industry, came through the port of Narvik and the territorial waters of Norway. British sea power was moving to cut off the flow when Germany, uninhibited by any threat on the western front, struck (April 9, 1940) Denmark and Norway. Success not only secured the flow of ore to Germany but also acquired coastal bases which precluded an effective Allied defense against submarine and air activities in the North sea. Denial of the area to the Allies secured Germany's northern flank. Later operations from Norwegian bases against Allied convoys into Murmansk bore eloquent testimony to the farsighted strategy of this manoeuvre.

By May 1940 the bloodless preliminaries of the Rhineland, Austria and Czechoslovakia had been followed by the brutal engulfment of Poland and Norway. Germany was now well prepared to undertake the destruction of France. Great Britain and France were not yet ready to fight. Militarily, Germany was superior in equipment, had more than double the number of Allied divisions, and in addition, had an overwhelming air force. France was further weakened by lack of offensive spirit and internal class strife.

The goal of German battle strategy was annihilation of the Allied forces. The 1914 plan of an enveloping attack through Belgium was replaced by a new plan to penetrate the weakest point of the French fortifications, at the end of the Maginot line in the Ardennes forest. The pattern was a gigantic manoeuvre in which a German feint on the right (north) occupied the northern channel ports, drew Allied armies northward into Belgium, following which the main attack swept through the Ardennes and to the coast, first destroying the Allied forces in northern France and Belgium, then completing the destruction in southern and eastern France.

In a few weeks the Wehrmacht defeated the European armies of the Netherlands, Belgium, France and England. The coast of western Europe was now secure to the axis from Spain to Narvik. Destructive air and submarine operations could be launched from numerous bases located throughout its entire length. In addition, bases could be developed for direct attack on the British Isles.

After the collapse of France, the strategic initiative everywhere rested with Germany. There were at least three possible lines of action, of which it might adopt one or more. First, Germany could undertake an assault on the British Isles to obtain full control of that territory; second, it could strike through the Balkans and North Africa to gain control of the middle east; third, it could invade the U.S.S.R. In a sense Germany undertook all three. The main weight of the nazi machine was shifted to crush its major objective—the U.S.S.R.—out of which, in accordance with Hitler's concept, could be carved a greater Germany. There was good evidence that Hitler expected to achieve victory over Russia within a few months, after which he could concentrate further effort wherever the situation required.

However, contrary to the early concept of Hitler, Great Britain, as well as the whole British empire, was now Germany's enemy. The situation required that the British Isles either be conquered or neutralized. Also, British hostility increased the strategic importance of the Balkans and the middle east to the axis military position. The axis strategy, as brought out by events to follow, indicated that the British Isles were to be neutralized by air and submarine attacks, the Balkans were to be overrun and the

middle east penetrated by campaigns against Egypt and perhaps through Asia Minor.

The German air assault was defeated in the battle of Britain, and the submarine menace was gradually overcome by dint of extraordinary Allied measures. As a result, the British Isles survived to become the base for launching the offensive which ultimately destroyed German power in western Europe.

Furthermore, the middle east was not conquered by the axis, and a vital gap in German planned territorial expansion was never closed. Most important, the Red army was not destroyed but eventually joined in the crushing defeat of Germany. The nazis thus failed in each of their strategic objectives. Success in any of the three undertakings of this period might have had a disastrous effect on the world's history.

In Sept. 1940, during the battle of Britain, the Italians struck eastward from Libya at the British in Egypt. Destruction of the British forces would have brought the strategic middle east under full axis control. The European axis and Japan could then have made a junction, a vital supply route to the U.S.S.R. would have been eliminated, important oil resources would have passed to the axis, India's position would have been compromised, severe repercussions might have been felt throughout the Moslem world, and North Africa, a potential base for attack against the southern flank of the axis, would have been difficult for the Allies to secure.

However, the British succeeded in their fight for time. The resistance, the delays, the losses inflicted in spite of tactical defeats and only a few victories, enabled them to hold on in the middle east. The issue was not finally determined until Gen. Erwin Rommel was turned back at El Alamein by Sir Bernard L. Montgomery's 8th army in 1942. This victory determined that the British would retain control of the middle east, an area vital to Allied strategy throughout World War II. While possession of Crete gave the axis added security in the Balkans, strategic domination of the Aegean sea and a base for offensive air operations, British determination had ensured that nothing essential to the strategic control of the middle east was lost.

Russia, by the spring of 1941, was practically isolated. It was small wonder it made a neutrality pact with Japan on April 13 of that year. Allies or potential allies could assist it only a little. The soviet for many months would have to fight its own battles and survive its own defeats.

The entire Balkan area had been secured to the axis in the spring months of 1941, and fighting in Crete was barely finished when, on June 22, 1941, Germany invaded soviet Russia. In 1941 the Wehrmacht was seeking primarily the destruction of the Russian army. Annihilation, taught by Alfred von Schlieffen, was to be accomplished through penetration and envelopment. The geographic pattern showed three terrain objectives and corresponding lines of operations—Leningrad, Moscow (initially Smolensk) and Kiev. The Red army could logically be expected to defend these vital objectives and in their defense might be destroyed. It was not clear that any specific battles were foreseen, but the tactics employed were such as to trap and devour masses of Russian troops.

On the other side, Stalin's early strategy was born of desperation and necessity. It was designed to sustain the war-making power of the nation until its strength and the attacks of its allies would permit the offensive. While initial soviet strategy was defensive, it was not passive and by no means called for defensive tactics.

The U.S.S.R. was not weak militarily. It had been rapidly preparing for war, and had absorbed the buffer Baltic states. It had almost inexhaustible manpower. In bloody engagements it could stubbornly trade space and manpower for time. Its industry, like its army, could not be destroyed in one mighty blow. Most important, the hardy Russian people possessed great determination and courage, both moral and physical, which could not be shaken by disaster.

All these factors were probably underevaluated by German strategists and statesmen as they were by the rest of the world. Only a few outside the U.S.S.R. doubted that superior German tactics and technique would quickly overcome the elements of Russian strength and accomplish the destruction of the soviet army. Alter the end of World War II, statements of responsible German leaders indicated that Germany expected a quick victory and prepared itself accordingly, both materially and psychologically.

By Dec. 7, 1941, Germany had advanced deep into Russia. Although it had failed to crush the Red army it had, in the eyes of the world, crowded Russia close to the brink of destruction. The situation in the U.S.S.R. on that date was of profound importance to the global strategic picture.

It is in a sense fallacious to mark Dec. 7, 1941, as a turning point in World War II. Certainly it did not mark any change in the axis procession of victories, unless to initiate for a period, more and greater ones for Japan. However, that date marked a fateful decision by Japan to make war on the United States—a development which was perhaps inevitable in view of its direct and irreconcilable conflict of interests with those of the United States.

Pearl Harbor temporarily paralyzed U.S. naval strength in the Pacific. On the other hand and of greater eventual significance, the U.S. people were immediately unified in a determination to defeat the axis. Although belated, the entrance of an angry and unified U.S. into the struggle, coupled with axis strategic mistakes and Russo-British success in preserving vital strategic areas and their armed forces, forecast eventual victory for the Allies.

In the spring of 1941 the United States had passed the lend-lease act, which was to contribute to Allied strength on every battlefield. The United States' entry into World War II stimulated this contribution and brought about combined (U.S.-British commonwealth) productive effort on a scale far greater than the axis believed possible. This industrial power, through the functioning of lend-lease and reciprocal aid, was employed to benefit all the Allies in accordance with planned priorities. It exercised a determining and overwhelming influence in the eventual Allied victory.

Allied Global Strategy.—As of Dec. 7, 1941, the strategy of World War II clearly became global; the relation between the Asiatic and European conflicts became well marked and had both a day-to-day and a long range effect. In order to allocate resources and guide preliminary operations, an over-all strategic decision was required as to the priority in which the Allies would take decisive action against their enemies. The U.S. and British leaders, Pres. Franklin D. Roosevelt and Prime Minister Winston Churchill, agreed that defeat of Hitler was to have priority over an offensive against Japan. British-U.S. preparations soon began to reflect this over-all decision.

It was an application of the best known principle of war which required the concentration of the mass of Allied resources against the major objective, in this instance, Hitler. As a corollary, the principle of economy of force had to be exercised elsewhere, especially in the Pacific and in India-Burma, where the concept required active opposi-

It was a decision for the United States and the British military chiefs who later as the combined chiefs of staff guided Allied strategy, including allocation of major re sources in western Europe, the Pacific, the middle east and Asia Especially for the United States, it was a difficult choice to make or implement Stung by the attack on Pearl Harbor, with its countrymen on Bataan dying with out hope of aid, and with its traditional friend China in danger of falling completely under Japanese control the US leaders could make and follow it only by exercise of the greatest courage. It was a lethal blow to the once suc cessful divide and conquer' strategy of the axis

The most serious threat rested with Germany Germany had more resources than Japan and these resources were more efficiently mobilized for war Furthermore Germany was nearer than Japan, both to the centres of Allied power and to the bases from which the final blows would be launched Fortunately, unprecedented and unexpected Al lied production later provided means to overcome the rela tive disadvantages and even permit assumption of a Pacific offensive before the final defeat of Germany

The important advantage of unified effort by the entire Allied coalition was largely dependent on the Hitler first strategy While eventual victory might also have been achieved under a Japan first strategy on the part of the US the inhibiting effect on Allied working relationships serious doubts as to the staying power of Russia and the time required to mount long range operations in the Pa cific were overpowering factors militating against such a course

There were at least six factors essential to the main effort and basic in the implementation of early strategy of the combined chiefs of staff although in themselves they could not bring about a decision. Strategic and opera tional decisions gave the factors full consideration. These factors were

- 1 The necessity of supporting the Russians whose forces were essential to complete defeat of the German land armies 2 Maintenance of the security and war making capacity of
- the British Isles and the western hemisphere
- 3 Maintenance of the stability of the middle east and prevention of an axis drive to join Japan and Germany
 4 Control of the sea lanes in the Atlantic, Pacific and Indian
- 5 The necessity of stopping the Japanese before they ad vanced so far or became so securely entrenched as to prolong World War II unduly
- 6 The need for keeping China in the war to contain Jap anese forces and possibly provide bases for operations against Japan as well as Chinese forces to mop up the Japanese spread through China

Success in these six factors alone would not assure vic tory they were nevertheless vital to the implementation of decisive offensive strategy. The factors did not change materially until very late in the conflict when the axis power began to crumble Although relative priorities be tween them could not be rigidly established the minimum essential means were required for each as failure in any one could not be countenanced A single failure would have had global implications. For instance, a failure to halt the Japanese advance would have forced the United States to shift major resources to the Pacific thereby seriously handicapping any major effort in Europe.

The basic factors in Allied strategy against Japan will be discussed later The above factors as they relate to the defeat of the European axis are worthy of individuil consideration

Support of Russia, of paramount importance to winning the European war, was provided in two ways-by actual combat and by supply Direct combat support, except by an, was slight until the Allied offensive in France was under way Probably the most important early effects through combat were from the British and US bomber offensives in 1943 and 1944 which reduced the capacity of German industry to support its forces in Russia and com pelled withdrawal of luftwaffe fighter squadrons from the soviet front Also indirectly, Allied strength in the Pacific and Asia must have exercised a strong restraining influence on any Japanese desire to attack Asiatic Russia, thereby saving the Russians from the problem of a two front war

Long before combat support produced any direct results US and British lend lease was reaching the USSR in substantial amounts and made a major contribution to the soviet military effort. A single item of more than 300 000 US made vehicles was in itself important enough to improve substantially the capabilities of the Russian army In 1941 and 1942 supply convoys to Murmansk and Arch angel were attacked by German U boat packs and aircraft from Norwegian bases which sank about one fourth of the ships Before the end of World War II substantial supplies flowed through Iran Alaska Siberia and Vladivos tok Since the items delivered and shipping used were in great demand by all the Allies, it was only a determined unity of purpose that permitted the deliveries

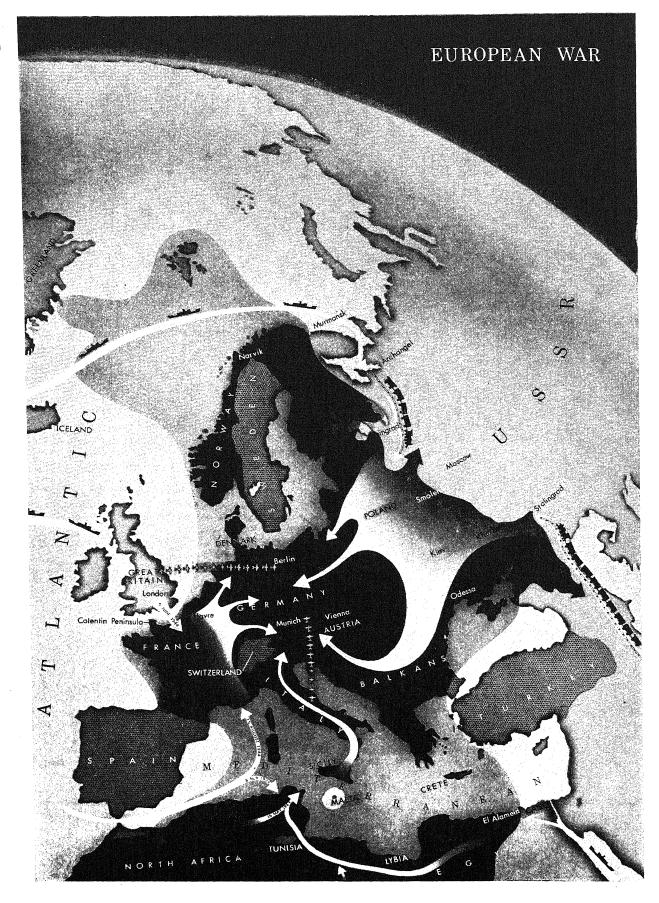

Maintaining the security and was making capacity of the British Isles was of vast importance in the strategic pat tern for the axis defeat. As an individual base, the United Kingdom was second only to the United States The islands were a springboard for decisive sea ground and air attacks on the axis Of major importance also was the maintenance of the will to win in a population which fur nished a large share of resources in men and materiel to bring about Allied victory Success in this factor required success in the battle of the Atlantic and in measures to defeat the German an and V weapon attacks However security was not complete until Allied infantry occupied the west coast of Europe

Britain had long been at grips with the axis in the middle east when the US entered World War II From the Allied point of view retention of the middle east was largely a British responsibility supported by US supplies and only a limited number of troops, principally air The British employed substantial forces and resources of all types in its accomplishment

Control of the Atlantic sea lanes was vital to the ac complishment of any of the other undertakings. It was sustained in a continuous and widespread maritime strug gle known as the battle of the Atlantic This battle be came critical within a month after the US entered World War II when effective U boat attacks commenced against shipping in the western Atlantic. In 1942 total losses in ships exceeded ships built

However the U boat was gradually subdued by a variety of measures both defensive and offensive in character In addition to naval surface craft, United States and British aircraft military and civilian, were used extensively on patrols Use of Iceland Greenland Newtoundland and later the Azores, as bases, greatly facilitated operations As an offensive measure the strategic air forces bombed German submarine bases and production facilities with limited effect. The menace of the U boats was drastically reduced by the combined effectiveness of the various meisures adopted and, after seizure of their western Lurope bases in 1944 this weapon was no longer a threat

It must be continually borne in mind that the minimum

demands of these vital undertakings were ever present and at times so urgent as to assume a priority higher than the main effort. In this situation, only the clearest of judgment and the greatest determination on the part of Allied leadership kept plans and their implementation directed with maximum efficiency toward the vital objective of destroying the axis military power.

Europe and the Mediterranean.—It was generally accepted in principle from early 1942 that the axis could be destroyed in Europe only by Allied victory on the continent, probably in Germany itself. Russia would play a vital role, but the western Allies would have to open a second front to make victory possible. The obvious solution was invasion of the continent at a suitable time and place to close with the axis forces and destroy them.

This was the final answer, but as stated earlier, it could be so oversimplified as to be almost meaningless in a serious analysis of the problem. There was no precedent on which to pattern the solution. There were political considerations such as the necessity for early victory and for encouraging resistance movements in occupied areas. The early liberation of France and British interests in the Mediterranean were some of the many conflicting factors to be resolved.

There was no textbook, no manual, no doctrinc which could be clearly and definitely applied. The great prestige of German arms did not tempt responsible Allied leaders to reckless or audacious schemes. Massive amphibious operations on an hitherto untried scale would be required. Discounting a few late lessons from Japan against relatively weak resistance, all the wars in history provided poor precedents and no encouragement for an amphibious assault against a strong and vigorous enemy. In short, it was easy to prove that the task could not be done.

In early 1942 a cross-channel operation for the summer of 1943, known as "Roundup," was discussed by the combined chiefs of staff. If an early desperate situation on the Russian front required a diversionary attack, a lighter and earlier assault known as "Sledgehammer" would be substituted for "Roundup."

By July 1942 the situation in Russia looked unfavourable, while Rommel was threatening Egypt on the El Alamein line. Hitler's strategy was strongly offensive—aerial bombardment of Britain, break-throughs at Stalingrad and in Egypt, and later a junction in the middle east. The British and U.S. decided to undertake "Torch," an offensive against North Africa, as the only possible move having a fair prospect of success with the limited resources available. As the Allies were still on the defensive, operation "Torch" was strategically defensive. Generally speaking, the expected returns included savings in shipping, extension of the blockade, increased security of the middle east and possible reconstitution of a French army in North Africa. Also, control of the North African area was a necessary preliminary to any strategic offensive which might later be made through the Mediterranean.

The soviet counteroffensive of the winter of 1941 and 1942 inflicted heavy casualties on the Germans but suffered reverses in the Crimea and at Kharkov. Just when the soviet war was beginning to look less like a blitzkrieg and more like a war of attrition, a serious nazi threat came in the summer of 1942 with the German drive toward the Caucasus and Stalingrad. This drive, if successful, would have cut off the oil of the Caucasus from the Russian armies and opened the way for axis control of the middle east. The attack was savage, but fell short of cutting off the oil or the flow of American lend-lease supplies. When the Russians, commanded by Vassily I. Chuikoff and

Georgi K. Zhukov, saved Stalingrad, the danger of disaster was past, and it was only a question of time until the Red army could commence offensive operations.

Meanwhile, Rommel's forces rolled dangerously near to Alexandria and Cairo. Further advance, however, was delayed by strong blows from the air and difficulties inherent in a long and inadequate supply line. British reinforcements at El Alamein halted Rommel and finally, by Oct. 1942, launched the attack which drove the Germans back to destruction in Tunisia. The German strategic pincers failed to close in the middle east, having met sharp tactical reverses in both Russia and Africa.

While in early 1942 cross-channel operations had been envisaged as essential to the defeat of Germany, the beginning of 1943 saw the Allied Mediterranean campaign being pressed forward with a vigour absorbing more and more resources. In Jan. 1943 the combined chiefs of staff decided to invade Sicily by midsummer in order to obtain further advantages to shipping and continue the momentum of recent successes in the area. In May 1943 the combined chiefs of staff decided that Allied pressure would extend to forcing Italy's withdrawal from World War II. The strategic advantages of success included denial of Italian manpower to Germany and the securing of a land base for launching possible invasions into the Balkans or southern France. In a sense, a second front in Europe would be created which would absorb limited German resources, although it was doubtful that the U.S.S.R. ever considered Italy sufficient diversion to be termed a second front. An important consideration was the advantage of maintaining the momentum of the successful attack on Sicily rather than to shift forces to another theatre.

Invasion of Fortress Europe.—While operations in the Mediterranean were proceeding with energy, it was accepted that defeat of the German armies in west Europe could occur only on the ancient battlefields of France and the Low Countries. Some strategists continued to press for the Allied main effort to be made through Italy and even the Balkans; however, the general determination to undertake a cross-channel invasion prevailed.

Preparations for the attack had been initiated in June 1942, but as a result of diversion of resources to the Mediterranean, consummation had to await successful conclusion of the North African campaign.

At Casablanca in Jan. 1943 the combined chiefs of staff directed definite preparations for cross-channel operations to take advantage of any sudden German weakness or for an assault in the spring of 1944 if no previous opportunity occurred. This decision gave definite impetus to the build-up of resources in the United Kingdom, to a combined bomber offensive and to formation of a combined plan for the continental assault. Although the air offensive was placed in first priority, the over-all plan evolved by mid-1943 provided for an Anglo-U.S. ground and air assault ("Overlord") in the spring of 1944.

It should be noted that definite combined (British-U.S.) planning and large-scale preparations for "Overlord" began about one and a half years before the assault was undertaken, and at a time when Allied defense around the globe was just beginning to achieve success. Preparations to carry out the simplest strategic decision often present problems of great magnitude and require substantial time prior to execution. Such was the case here.

A major element in the strategic pattern for the defeat of Germany was the combined British-U.S. air attack. This

attack absorbed a substantial proportion of the total avail able resources and considerable effort had been expended in analyzing its effect. According to the United States Strategic Bombing survey, the number of planes involved reached a peak of some 28 000 and men in combat com mands a peak of 1 300 000. The total loss in air action was about 158 000 men and 40 000 aircraft. This was a tre mendous expenditure of men and treasure to implement a hitherto untried employment of a new weapon. It demon strated the determination of the leaders to exploit fully the vast technical and industrial power of the United States and Britain as well as the possibilities of new developments in winning a war.

In addition, attacks both before and after D day on the German transportation system, combined with devastating strikes on oil resources severely reduced both the strategic and tactical mobility of the German forces and logistically had a paralyzing effect. The extent of these successes was extolled in the United States Strategic Bombing survey as follows

Allied air power was decisive in the war in Westein Europe Hindsight inevitably suggests that it might have been employed differently or better in some respects. Nevertheless it was decisive In the air, its victory was complete. At sea, its contribution, combined with navil power brought an end to the enemy's greatest naval threat—the U boat on land it helped turn the tide overwhelmingly in favor of Allied ground forces. Its power and superiority made possible the success of the invasion. It brought the economy which sustained the enemy's aimed forces to virtual collapse.

Some had hoped that Germany could be defeated in the west by air power alone, but plans had never envisioned such success. Air power was a decisive contributing factor, but the tenacious will of Germany to fight even after Allied armies crossed the Rhine demonstrated that the Allied leaders were correct in their judgment that a second front' on the ground (Overlord) was required to ensure early German defeat.

By D day, June 6, 1944, the USSR had not yet started its big summer offensives but was preparing all along the front A coordinated offensive by combined forces under Field Marshal Sir Henry Maitland Wilson in Italy pinned down German forces there, and an attack by French and American troops under General Jacob L Devers against southern France was to be launched in mid August The German leaders were probably aware of the forthcoming attacks on the west and east but it is doubt ful if they anticipated the strength and skill with which their coastal fortifications in France would be assailed or the paralyzing effect of the accompanying air attack. The destruction of their industry by strategic bombing and of their communications by tactical air preparations, together with loss of control of the air, was only a foretaste of the deadly blows about to be struck

Battle strategy of the supreme allied commander in Europe, Gen Dwight D Eisenhower, involved a landing, amphibious and airborne, between Le Havie and the Cotentin peninsula of Normandy In mid August the supporting attack was landed in the south of France. The Allied advance pushed rapidly across France and Germany to a junction with the Russians along the general line of the Elbe river. There were inevitable delays caused by German resistance and the necessity for seizing and operating ports and lines of communications in support of the idvance. However, as the attack progressed, large masses of German forces were progressively destroyed. At the time of the final German suirender on May 7, 1945, Ger

man military power had virtually ceased to exist

The Russians having held the general Leningiad Odessa line on D day advanced across eastern Poland into the Baltic states in July and August By Sept 1944 the drives by Fedor Tolbukhin's and Rodion Y. Malinovsky's armies into the Balkans were under way and became the principal soviet effort for the remainder of the year. The Balkans were soon largely under soviet domination. In early 1945 Zhukov's forces smashed across Poland and East Prussia to stand along the Oder river from which they subsequently advanced to the Elbe. By April their push up the Danube reopened to reach Vienna by the end of World War II.

In north Italy meanwhile the Allied armies had crossed the Po river in late April and were sweeping toward the Alpine passes

In general therefore the final destruction of Germany involved two great attacks one on the east and one on the west. The western attack involved initial amphibious and airborne landings in Normandy followed by destruction of German forces in France the Low Countries and west ern Germany. The eastern attack of the USSR swept westward from the Leningrad Odessa line, crushing German forces in its path and eventually meeting the western democracies in Germany and Austria. Contributions of the Italian front were an initial holding attack and pio vision of a base for supporting operations into south Europe.

The general pattern of Allied conquests found the west ern democracies, at the end of World War II in control of Italy and western Germany Eastern Europe and the Balkans were under Russian domination. This was a direct result of the military strategy employed and of great sig nificance to the political economic and military future of Europe

The conclusive element in the German surrender was the Allied ground strength. Until the infantry of the western Allies and Russia joined at the Elbe, Germany's will was unbroken However, it was useless to attempt an assessment of credit to each of the various arms services or nationalities The pattern for victory was dependent upon the early refusal of soviet Russia and England to accept defeat and on their retention of vital areas. The naval roles of securing the sea lanes and participating in the amphibious attack were also vital and essential. The importance of air operations has already been described Nothing could have been accomplished without the logistic support of the military services Civilian industry provided the sinews for all Not least in importance was the ac complishment of the leaders in guiding the production and organization of all the vast resources required and in the strategic determination of where and how they should be used These leaders, having defeated the European axis had yet to complete the same task against Japan

Japanese Objectives and Strategy.—General of the Army George C Marshall's analysis of Japan's objectives and plans was in part as follows

Strategically, Jipan was well poised in 1941 to carry out her tims in Asia. All the major world powers who normally main tained the status quo in Asia were absorbed in the war in Europe France had been overrun and eliminated. England was threatened by German invasion. The USSR was attempting to repel a German invasion on her Westein front reaching to the gates of the capital. The United States had become the Arsenal of Democracy with major efforts directed toward the support and preservation of our European Allies.

The Tripartite Pact had been signed giving Japan a free hind in Asia She had a large and relatively well equipped army and a moderately good an force well trained by actual combat in China She had obtained by forced agreement a

staging area in Tiench Indo China She had a fairly luge may especially strong in the transport craft available. She had accumulated by great national economy a good stockpile of strategic materiels at home for the initial effort and with each successive conquest she obtained new and important areas from which other supplies of materials could be drawn such as oil jubber, and metal. The Japanese mistakenly believed in the hearty cooperation of 'liberated' peoples of the so called Greater East Asia Co Prosperity Sphere with their huge labor pools. Japan considered herself ready to strike.

Japan's objective was the conquest consolidation and eventual domination of the whole Far East. She intended to make her conquest in a rapid surprise drive which would overpower all resistance to form an iron ring of outer defenses against which the spiritually inferior pacifistic combination of opponents could beat themselves into weariness, while she consolidated

her gains at leisure

Japan's plan for accomplishment of its objectives as later known or deduced from its actions and from interrogation of leaders involved

1 Neutralization or destruction of the United States Pacific

fleet by an attack on Peaul Harbor

- 2 Conquest of the Philippines the South Pacific Islands and the Burma Malaya Netherlands Indies barrier in order to se cure a strong southwestern flank against attack and to gain control of the sea lanes in the west and southwest Pacific South China seas, and the eastern part of the Bay of Bengal Control of these areas would cut China's supply line across Burma and isolate Australia
- ${\mathfrak Z}$ Later, capture of Midway and raids on Hawiii and the west coast of the United States
- 4 Invasion of the Aleutians to form a northern flank if initial success in that area warranted it
- 5 Stimulation of unrest and possible revolution in India 6 Probably eventual conquest of Siberia and the maritime provinces of U S S R $\,$

Therefore, while the German war concept had visualized the relatively unlimited objectives of the destruction of its principal enemies, the Japanese visualized a limited objective of securing a large area to its control but without the destruction of its principal enemy, the United States Furthermore, in contrast to Germany's doctrine of making a single main decisive effort, the Japanese strategic scheme was unorthodox. It involved simultaneous attacks in several different directions each with a limited objective. Even with efficient internal lines of communication, such a plan is ordinarily unsound because it requires a prolonged dispersion of forces to widely scattered points

Nevertheless in the situation as it existed, the Japanese strategy did not appear unsound Japan did not have means to destroy the power of the United States, but a quick victory leading to a favourable negotiated peace seemed a possibility Special preparations permitted Japan to concentrate superior power at nearly all the points of attack. However, when the productive power of the Allies exceeded even their own expectations, Japan's under estimate of Allied determination, strength and capabilities became a logical but fatal error

There was no indication that Japan and Germany succeeded in coordinating their strategy in the sense that agreements were reached on specific military operations or any combined allocation made of resources, such as submarines. The only possible coordination appears to have been through the timing of Japan in forcing the US into a two-front war and increasing the burdens on the British empire. However, the Japanese timing had the effect of forcing Germany into a war with the United States. There was evidence that Germany actually attempted to persuade Japan to attack Russia rather than south or east in the Pacific. Thus, Germany may have foreseen the possible implications on itself of a Japanese attack on the US Continued failure to coordinate was one of the principal blunders in axis planning and conduct of the war

Implementation of Allied Strategy against Japan —Con sidering the elements of the Japanese plan it was apparent that success therein would have indeed accomplished the objective perhaps beyond any Allied power to penetrate the iron ring and destroy Japan without an unacceptable cost. It is therefore appropriate to examine each of the elements to see wherein and why Japan failed.

Neutralization of destruction of the US fleet at Pearl Harbor was accomplished only temporarily and incompletely US naval power was not destroyed. The leader ship the men, the traditions, the know how of operation and production and the repair and manufacturing facilities were unimpaired. Even the principal US naval bases except in the far Pacific, were never lost

The objective of overcoming the Philippines, the South Pacific islands and southeast Asia including the seizure of Malaya and Burma was accomplished in 1942. However the resources of this area were never effectively exploited by the Japanese. China's overland supply line was cut in the Burma campaign in 1942, but China was never completely isolated and soon began to receive supplies by air from India. The important thing was that China never gave up but remained in World War II in accordance with one of the basic factors of Allied strategy. The Allied navies, in continuous and widespread operations, assisted by the air and land campaign to secure Port Moresby successfully maintained communications with Australia thus preventing its isolation. Allied strategy required that these sea communications be maintained.

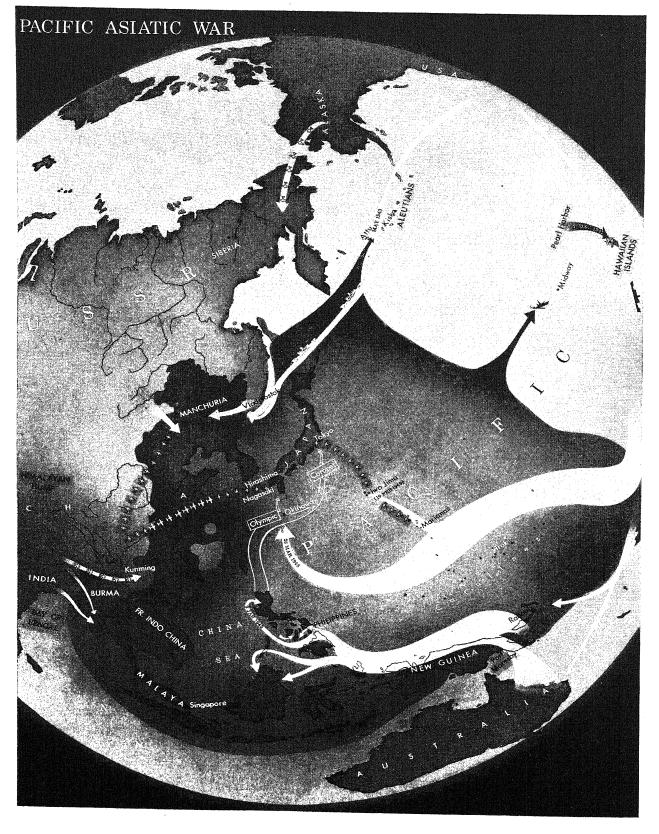

The attempt to invade Midway Island was foiled in the battle of Midway in June 1942. This and the Coral sea battle were the first decisive defeats inflicted on the modern Japanese navy. Not only was the threat to Hawaii removed but the reduction in Japanese carrier based air strength swung naval power in the Pacific back into bal ance. Thereafter until its air strength was rebuilt, the Japanese navy could operate safely only under cover of darkness or land based air protection.

The Aleutians were partially invaded and occupied in June 1942 (Kiska and Attu). However, failure in the bat tle of Midway and failure to push further eastward along the Aleutian chain made this occupation of no strategic importance to Japan.

India remained loyal to the Allied cause and furnished substantial resources in men and materiel contributing to the axis defeat

Japanese strategy failed when it missed the early oppor tunity to capture Hawaiian bases and to isolate Australia From these two areas were launched the advances which eventually converged on Japan and destroyed her. The grave perils of strategy with a limited objective thus bore the fruit of final defeat

Allied Strategy for Defeat of Japan.—By mid 1944 the Allied strategic concept for complete defeat of Japan was determined. Unconditional surrender was to be achieved by preliminary wearing down of Japan's ability to resist through air and sea blockade, intense an bombardment destruction of its an and naval strength, seizure of the necessary bases to serve as springboards and the ultimate invasion of the industrial heart of the empire. Blockade was of much greater significance against Japan a maritime nation, than it had been against Germany. There was a possibility that destruction of the Japanese forces in Man churia, China and elsewhere would have to be accomplished also. This latter possibility existed even at the formal surrender.

This concept required intense submarine, surface and air operations against Japanese sea communications, air bombardment of vital resources and simultaneously a continued amphibious advance across the Pacific to seize major bases from which could be launched the final overwhelming land, sea and air assault. In the advance, it was inevitable that Japanese sea power would be met in force and that its air power would have to be overcome. Japanese ground armies could be by-passed except in those areas essential to the advance. Control of the sea and air was the key factor. As long as such control was maintained, ground forces could be pushed in to seize the required islands or areas. However, sustained loss of control in any area would mean local disaster. Of course, the air and sea operations were tied to land bases which the ground forces must seize and secure. Hence, the importance of a unified land, sea and air team was magnified.

It must not be supposed that each of the various amphibious steps could be foreseen at the outset. In a geographic sense, it could not be determined at once whether or not bases on the China mainland would be required. Nor did it seem unlikely at the outset that an Allied attack would have to break through the Malaya-Netherland Indies barrier from the Indian ocean area to join eventually in the final assault. Furthermore, it required the experience of vigorous operations to demonstrate the feasibility of neutralizing and by-passing strong Japanese bases.

Japanese strategy, after the Allied assumption of the initiative, was one of passive defense. Having lost the initiative, Japan seemed largely paralyzed except for desperate naval actions and development of such extreme measures as Kamikaze or suicide attacks.

In a sense, Japan lost the strategic initiative at the battle of Midway on June 3-6, 1942. There followed a period in which the Allies gradually assumed the tactical offense but were not yet prepared to seize any of the areas vital to the Japanese position. This is sometimes called an offensive defense, and its early assumption was a necessity in the Allied concept of Pacific strategy.

Although that concept originally envisaged that the strategic offensive must await the defeat of Germany, it also required that Japan be kept off balance in the interim by tactics which would prevent consolidation of its position and further advances. This offensive detense was one of the strategic fundamentals of the combined chiefs of staff and included in its tactical objectives the acquisition and development of bases from which to launch major offensive action when means became available.

During the early phases, tactical thrusts known as island hopping were employed. It gradually became apparent that Allied naval and air superiority would permit bypassing of Japanese land forces on isolated islands, and as Allied strength and skill increased it was evident that even strong bases such as Truk could be by-passed and neutralized by air and sea operations. On the larger land masses such as New Guinea, by-passed Japanese forces required ground as well as air and naval forces for their neutralization. The first major Jap base so by-passed was Rabaul, after which it was apparent that only selected base areas need be seized. From these the Allied forces could step rapidly across the Pacific to the springboard from which the final assaults on Japan itself would be launched.

The land, sea and air arms found teamwork of primary importance. Two such teams, one commanded by Gen. Douglas MacArthur, the other by Adm. Chester Nimitz, operated under the control of the U.S. joint chiefs of staff, as independent but mutually supporting commands which co-operated not only as to the timing and the objectives of

their operations but also as to transfer of resources between them. These commands advanced on converging axes, one through the Southwest Pacific from New Guinea to the Philippines; the other across the central Pacific to the Marianas, Iwo Jima and Okinawa.

The advances were in successive strides, each step securing areas which could be developed to provide supporting facilities for subsequent campaigns. It was found that carriers could provide air cover until land-based air forces were established on shore in the areas assaulted. This capability was an operational factor which increased the length of the strides. Eventually the most advanced Allied bases projected Allied power within striking range of Japan itself, and cut the empire's supply lines to the south and the China coast. Allied military and economic strength and carefully scheduled interchange of amphibious resources permitted effective support to both arms of the pincers.

Strategy in Southeast Asia and China.—In the preliminaries for the final phase, southeast Asia, India and China played an unspectacular and indirect, but nevertheless important, role. From the beginning it was basic to maintain China in World War II. Not only were there substantial Japanese forces in China, unavailable for use elsewhere, but also their logistic support was a continual drain on Japanese resources. In addition, the possible future requirement for China bases to support the final assault on Japan demanded that Chinese forces be kept in being to help secure such bases at the appropriate time. As a direct contribution, air forces operating from China attacked industry and shipping.

The support to China all channelled through India and thence over the Himalayan "hump." Therefore, in the early stages of World War II, the strategy in India was directed toward the security of India and support of China. In the fall of 1943 the combined chiefs of staff created the Southeast Asia command (Adm. Louis Mountbatten) which assumed the responsibility in that area for operations against the Japanese, initially those necessary for protecting India and securing and improving the supply line to China. As a direct contribution to the defeat of Japan, Southeast Asia command prepared to capture Singapore and advance into the South China seas. Such preparations could not be implemented prior to V-J day because of lack of resources, although the Japanese army in Burma was destroyed by the end of hostilities. The security and quantity of supplies to China were continuously increased.

Air operations from China bases contributed materially to the attrition of the Japanese air force and to Japanese shipping in coastal waters of China. In addition, Chinabased B-29s struck the first blows at Japanese industry.

The Allied strategy in China, India and southeast Asia thus succeeded in its basic objectives of maintaining China in World War II and projecting operations to absorb and dissipate the enormous Japanese resources in the area.

Japan's Defeat—Final Phase.—Direct preparations for final amphibious assault on the Japanese Islands were underway in early 1945 and proceeded rapidly. New advanced base areas in the Marianas, Philippines and Okinawa were secured and developed. Resources were increased through redeployment of troops and supplies from the European theatre and other areas.

Japan's shipping had already been severely reduced by attacks from U.S. submarines. Losses became more critical as Allied air and naval raids struck deep into home waters. Plans and preparations were progressing rapidly toward

the full consummation of forcing Japanese surrender by seizure of vital objectives in the home islands. It appeared that the U.S.S.R. would attack the Japanese forces in Manchuria, while in China there were good possibilities of a

successful Chinese offensive to seize a coastal port.

The final amphibious blow was never struck. The threat of immediate land attack from all sides, the destruction of Jap shipping, loss or isolation of many outlying areas and forces and the strategic air attack, all combined with the effects of blockade, broke the will of the Japanese people. Desperate intentions and preparations by the Japanese army and the Kamikaze air force to die in the defense of the homeland could not be sustained in the face of mounting disaster.

By late 1943 it was visualized that strategic air attacks would play a major role in wearing down Japan's ability to resist. Starting in Nov. 1944 attacks from the Marianas bases centred on the Japanese aircraft industry. In March 1945 Gen. Curtis Le May's B-29s shifted from high altitude attacks to night incendiary strikes on urban industrial areas from altitudes of 7,000 ft., aimed at the destruction of the basic economic and social fabric of Japan. This method proved so highly successful that by the end of World War II, 66 of Japan's largest cities had been heavily damaged.

Thirty per cent of the urban population had lost their homes and one-quarter had evacuated the cities as a byproduct of the devastation of industrial areas. The holocaust wrought by the atomic bomb in Hiroshima and Nagasaki was the final blow. It crystallized growing intentions in the minds of Japanese leaders to surrender and brought about speedy capitulation.

As atom bombs levelled Hiroshima and Nagasaki, and the Japanese government finally made its decision to surrender, soviet armies struck into Manchuria. It does not appear that this attack materially hastened the final capitulation of Japan. However, the virtual certainty that a Russian attack would be launched eventually was undoubtedly a factor influencing an early decision to capitulate. Also, it must be realized that, throughout World War II, powerful Japanese forces were deployed in Manchuria prepared to meet a potential soviet threat. These forces could not be employed to meet Allied moves elsewhere. Therefore, it may be said that Russian forces in Manchuria did play a substantial role in Allied success in the Pacific.

Japan's surrender was brought about by developments for which each Allied service was in a measure responsible, although the final spectacular and conclusive role was played by the strategic air forces and, to a lesser extent, by raiding carrier task forces. As in Europe, it was useless to attempt to list these developments in order of importance or to allocate the credit for victory. In every campaign the various arms and services were interdependent for success. The final result could not have been achieved without the phenomenal industrial capacity of the United Kingdom and the U.S.

The important military developments which shattered the fighting will of Japan were:

- 1. Destruction, damage or paralysis of virtually all Japanese shipping by submarine, air attack and mining.
- 2. Destruction of the Japanese navy and the overpowering of
- 3. Actual loss or ineffectiveness of Japan's resources caused by loss of control of the sea, air and outlying key base areas.
- 4. Devastation of the strategic air attacks on the homeland. 5. Strategic position of Allied bases, where land, air and sea forces were poised to invade the homeland in overwhelming force.

6. Probability that the U.S.S.R. would attack the Japanese forces in Manchuria.

Aftermath of the War's Strategy.—The effects of Allied war strategy on world affairs were by no means terminated on V-J day. The wartime strategy largely determined the deployment of Allied forces at the end of hostilities and therefore in general the subsequent zones to be occupied by, or to come under the direct influence of each of the Allied nations. In Europe, the western democracies had decided to avoid major Balkan operations, which resulted in Balkan and eastern European occupation by Russia. On the other hand, the Allied strategy placed Italy, France, the Low Countries and western Germany in the areas controlled on V-E day by the armies of the west. In the Pacific, rapid thrusts took U.S. forces into Japan before the other Allies could arrive. Thus the United States played the dominant role in Japan.

The important effect of occupational control on postwar political, economic and military developments was apparent. Each of the great powers found the strength and location of its armed forces an essential factor in its influence on world affairs. In each case the occupying power was able to confront theoretical or moral persuasion by other powers with the realities of de facto control. Stratton, Dorothy Constance

Miss Stratton (1899—), U.S. coast guard officer, was born March 24, 1899, in Brookfield, Mo. She taught history in her native town and later, moving to California, became (1924) vice-principal and dean of girls at the senior high school in San Bernardino. She joined the faculty of Purdue university, Lafayette, Ind., in 1933 as associate professor of psychology and dean of women and was made full professor of psychology in 1940. In the summer of 1942 she joined the women's naval reserves (WAVES) as a lieutenant and in September of that year, she was appointed assistant to the commanding officer at the training centre for radio operators at Madison, Wis. When the women's reserves of the coast guard was created, she was selected to head the new unit.

Promoted to the rank of a lieutenant commander, she was sworn in Nov. 24, 1942, and was raised to a captaincy

Strawberries

See FRUIT.

Streeter, Ruth Cheney

Mrs. Streeter (1895—), officer of the U.S. marine corps women's reserve, was born Oct. 2, 1895, in Brookline, Mass. She was educated in Boston and Paris schools and Bryn Mawr college. After marrying Thomas Winthrop Streeter, an attorney, in 1917, she settled in Morristown, N.I.

After the women's reserve of the marine corps was formed early in 1943, Mrs. Streeter was appointed director and was inducted with the rank of major.

Mrs. Streeter was later raised to the rank of lieutenant colonel, and on Feb. 1, 1944, was promoted to the rank of colonel. She returned from the marine corps in the summer of 1946.

Streicher, Julius

Streicher (1885–1946), German politician, was born Feb. 22, 1885, at Fleinshausen. He served in the army during World War I, and became a school teacher in Nuernberg in 1919. In the early 1920s, he joined the nazi party and participated with Hitler in the Munich putsch of Nov. 1923. In that year he also founded a weekly magazine, Der Stuermer, in which pornography and anti-Semitism were combined to obtain mass circulation. Encouraged by Hitler, Streicher became the most extreme anti-Semite of the Third reich. After the nazis gained power in 1933, Hitler appointed Streicher to the Academy for German Law.

He was also made gauleiter for Franconia. Streicher thereupon intensified his anti-Semitic activities, which he maintained throughout the succeeding years.

After Germany's defeat Streicher was captured May 23. 1945, by U.S. troops near Waldring, Bavaria, disguised as a painter. Indicted with a score of other top nazi leaders on charges of war crimes before the International Military tribunal at Nuernberg, in 1945, Streicher was found guilty of crimes against humanity on Oct. 1, 1946, and was sentenced to death. He was hanged on Oct. 16, 1946, in Nuernberg.

Strikes and Lock-outs

The number of strikes in the United States from 1937 to December 1946, is shown in Table I. The years 1937, 1941, 1944-46 were characterized by marked strike activity, 1946 being the worst year for strikes in U.S. history. During Jan.-Aug. 1946, three times as much

Table I.—Number of Strikes, Workers Involved and Man-Days Lost, 1937-46

Year	No. of strikes beginning in year indicated	Workers in- volved in strikes beginning in year	Man-days idle	Average days lost per employee
1937	4.740	1,860,621	28.424.857	15.5
1938	2.772	688,376	9.148.273	13.3
1939	2,613	1,170,962	17,812,219	15.3
1940	2,508	576,988	6,700,872	11.7
1941	4,288	2,362,620	23,047,556	9.9
1942	2,968	839,961	4,182,557	5.0
1943	3,752	1,981,279	13,500,529	6.8
1944	4,956	2,115,637	8,721,079	4.1
1945	4,616	3,069,300	24,360,000	7.9
1946 (11 months).	4,335	4,545,000	107,475,000	23.4

working time was lost through strikes as in any previous full year in U.S. history.

Table II (p. 197) summarizes the major types of issues, 1937–45. The classification indicates only roughly their relative importance because few strikes, except those solely for wage increases, involved but a single issue or type of issues. Demands for a closed shop, for instance, or even union recognition, were almost always only one of many issues involved in a particular bargaining. There were no statistics to show in how many bargainings each separate issue appeared. If there were, the list would be so long as to be difficult to appraise.

Table II shows that the predominant issue of the decade 1937-46 was wages. Breakdowns in Monthly Labor Review showed that it appeared in bargainings concurrently with almost every other type of issue. Next in importance were the issues centring around union security—recognition, closed shop, maintenance of membership, check-off, grievance procedure, discrimination and rights of union representatives.

Strikes, Year by Year.—The 4,740 strikes of 1937 exceeded any other year up to 1944. The upsurge of union activity which started in 1934, encouraged, at least, by section 7A of the National Industrial Recovery act and the 1935 National Labor Relations act, developed into a definitely militant labour movement. The split in the labour movement in 1936, which established the C.I.O. as a rival to the A.F. of L., intensified rather than retarded labour's drive to spread unionism into hitherto unorganized areas of industry.

Sit-down strikes, a tactic still being used in 1937, tended to increase the number of strikes, since the sit-down enabled workers who were dissatisfied to call strikes without waiting for authority from their union, or without organization. The year was essentially one of offensive strikes—strikes to compel union recognition, wage increases, shorter hours and other positive gains. Few of the strikes were defensive.

The automobile industry was the worst strike area of 1937. Industrial conflict had become serious in the industry as early as 1934 and reached a peak during the spring of 1937 in the General Motors, Hudson and Chrysler strikes, all of which ended in union recognition and agreements. Of automobile workers 48,000 went out in the General Motors strike, tying up operations in 50 plants in 25 cities and directly affecting the employment of 126,000 other workers. Following the major automobile strikes there were numerous "illegal" strikes; i.e., stoppages which violated the agreements with the auto manufacturers. Some of these were sit-down strikes. In November major strikes again broke out at General Motors and the Hudson Motor company, chiefly over impatience and suspicion concerning the renewal of the agreement. During the latter part of the year the United Automobile Workers (C.I.O.) staged several strikes at St. Louis and Kansas City against the Ford Motor company but during 1937 did not attempt a major strike against that company.

The Pacific coast maritime strike, which lasted 98 days and ended on Feb. 4, 1937, involved 37,000 workers directly and many thousands indirectly. Large strikes also occurred in the leading "independent" steel mills (Bethlehem Steel, Inland Steel, Republic Steel and Youngstown Sheet and Tube). More than 10,000 coal miners struck in support of the steel strike, which failed after lasting from May to July. A strike of 31,000 employees of the silk and rayon industry of New York, New Jersey and Pennsylvania

during the summer resulted in union agreements similar to those of the men's and women's clothing industries. Several strikes occurred in the rubber industry at Akton O.; and a severe strike in the plants of the Remington-Rand company in New York, Ohio and Connecticut. In New York 15,000 shipyard workers were out two months in a strike for union recognition. The many strikes in retail trade, hotels, restaurants and other service industries attracted widespread attention in 1937. They involved relatively small numbers of people compared with the large manufacturing industries, but affected the convenience of the public directly and were new areas of industrial conflict.

During 1938 strikes decreased sharply in number, size and drama. The number was only 58% of 1937; man days lost only $32\frac{6}{10}$; and people involved $37\frac{6}{10}$.

Only two strikes involved more than 10,000 people-the hosiery strike in Pennsylvania, New Jersey and New York' and the truckers' strike in New York and New Jersey

A quieting-down period was to be expected after the strike wave of 1936-37, and it occurred in 1938. Business recession made the situation unfavourable to labour militancy, while the success of the National Labor Relations act in forcing employers to accept collective bargaining, together with the problems which labour leaders had to lace, arising out of the struggles between the A.F. of L. and C.I.O. tended toward a diminution in strikes.

Sit-down strikes were rare in 1938. The "slowdown,"-a tactic not measurable with statistics-continued to be used, but actual seizures of employers' plants had been dropped as a labour tactic. More than half of the strike activity of the year was concentrated in five industries outside the mass production industries—textile and clothing factories, trade, construction, local transportation and food manufactures.

The number of strikes decreased again in 1939. There were 159 fewer than in 1938. But nearly twice as many workers were involved and almost twice as many mandays were lost. The large loss of time was the result of the coal strike in April and May. Except for the coal strike, the disputes of 1939 were widely distributed, both industrially and geographically, and not of major importance. The principal strikes, outside of coal, were in the maritime and automobile industries.

In 1940 the number of workers on strike and of mandays lost dropped to the lowest figures of the decade 1937-46, with the exception of the year 1942. The monthlong strike of painters in New York city and the strike of 12,000 Pacific coast lumbermen, which started in December and continued into January, were outstanding in a year of moderate strike activity. There was no marked concentration of strikes in particular industries or areas. Nearly one-half the man-days lost during the year resulted from strikes involving relatively small numbers of employees. In retail trade there were 482.000 man-days lost; in machinery manufacturing 816,237; in lumbering 806,-773 and in transportation occupations 593.283.

A.F. of L. unions carried on 62% of the 1940 strikes, and their members constituted 53.5° of the employees on strike. C.I.O. unions called $28\frac{\sigma}{10}$ of the strikes and their members were 10° of the people who struck. More of the C.I.O. strikes than of the A.F. of L. were in mass production industries, particularly automobiles, steel, rayon. aluminum, shipbuilding and aircraft. Only 3^{α}_{0} of the strikes resulted from the controversies between the A.F. of L. and C.I.O.

In 1941 the number of strikes increased sharply. There were 70° more than in 1940. The new development in 1911 was that government representatives or boards (largely composed of people drawn into public life for the purpose) assisted in settling more than hall the strikes ending that year. These disputes involved nearly three-quarters of all the workers and 85°_{\circ} of the strike idleness of 1941. Three plants were serred temporarily by the government on account of labour disputes which interfered too seriously with war production-the North American Aviation company (Englewood, Calif.), Federal Shipbuilding and Dry Dock company (Kearney, N J.) and Air Associates. Inc. (Bendix, N.J.). The North American Aviation dispute was the first after 1921 to result in intervention by federal aimed forces. The strikers resumed work soon after the seizure on June 9 The National Mediation board effected a settlement of the dispute. On July 2, 1941, the plant was returned to private control.

The 3-month International Harvester strike which involved 15.700, the Allis-Chalmers 76-day strike involving 7,800, the strikes of 318,000 coal miners throughout April, the "captive mines" strikes of 58,000 intermittingly in September-October and the dramatic Ford Motor "organization" strike in April illustrate the large-scale strikes which caused more than 23,000,000 man-days to be lost in 1941. The west coast welders' strike involved 12.500 welders from shipyards and metal-working plants. In 1941 the coal miners lost 4.5°_{10} of their possible working time by strikes. There was no other industry in which the emplovees lost so much as 1°_{0} of the possible working time. The miners constituted 17^{o}_{o} of all the workers who struck during the year and lost $g1^{o}_{o}$ of the total man-days lost by all strikes in the nation. Steel had 10% of the strikers and construction 8° e. The number of strikes had been exceeded previously only in 1937 and 1917, and the number of strikers exceeded only in 1919. One-twelfth of the nation's industrial workers were involved at some time during the year.

War and Decline.-Pearl Harbor quickly arrested the epidemic of strikes, and several important ones were called off. In other cases where affirmative votes had been taken the strike was cancelled. Labour organizations pledged their full support to the war effort.

New York city was the "strike-capital" of the nation as far as urban industries were concerned. It had more strikes and more strike idleness than any other city. The other

urban areas most affected were Philadelphia, Detroit, Dearborn, Los Angeles, Cleveland and Chicago. The largest was at Ford's River Rouge plant, with 85,000 men out. The A.F. of L. called 54% of the strikes. but the C.I.O., with but 37°_{\circ} of the strikes, called out 70% of the strikers.

^{*}Compiled from information supplied by Monthly Labor Review, U.S. Bureau of Labor Statistics
**Not tabulated as separate item for this year

The year 1942 saw another sharp drop in strikes Labour and industry concentrated on getting out war materials. Overtime made earnings high, and the cost of living had not yet gone up sharply. Labour leadership and industrial leadership both indicated that every effort would be made to maintain industrial peace. The government's wage and price stabilization program promised to prevent strikes caused by rising costs of living. Hope ran high throughout the country that the government agencies set up to adjust labour disputes and protect the interests of wage earners during the war would prove adequate to prevent strikes detrimental to the war program.

Strikes dropped from 4 288 in 1941 to 2 968 in 1942, the number of strikers from 2 362,620 to 839 961 and mandays lost from 23 047,556 to 4 182 557—the lowest figure for the decade 1937-46 With industrial production 16% greater than in 1941, the cost of living up 1% and em ployment up 700, strikes were fewer, smaller and of shorter duration And of the strikes which occurred, a consider able number were not authorized by unions but originated among the local rank and file But 46% of all the strikes which did occur and 68% of the employees involved were in industries directly related to the war effort. In mining 515 000 man days were lost, in textile products 463 700 days, in iron and steel 270 000 days, and in leather manu facture 241,000 days Of the strikes 72% were concentrated in such leading industrial states as New York, Pennsyl vania, Massachusetts, New Jersey, Ohio, Indiana, Illinois and California Government agencies assisted in settling 1,880 of the strikes, 1,408 through conciliation, 121 by arbi tration and 349 through formal hearing by the War Labor board In two cases, the Toledo, Peoria and Western rail road and the General Cable company of Bayonne, N J, government seizure occurred In the railroad case the company refused to obey an award of the War Labor board and in the cable company case there was an unauthorized strike against the decision of the War Labor

In 1943, with the war at peak intensity, the number of strikes increased substantially. There were 784 more strikes than in 1942, nearly twice as many strikers and

"Ladies and Gentlemen—the Winnah" Ross Lewis' cartoon appeared in the Milwaukee Journal shortly after John L Lewis called a strike of the United Mine Workers on April 30, 1943

more than 3 times as much loss of working time

Coal was again the major area of conflict. The 2 year agreement negotiated in 1941 expired, and the coal miners demanded a \$2 a day increase in wages, 6 days' work per week, portal to portal pay, double time for Sunday work and other substantial gains. On April 29 the president ordered all strikers back to work on pain of government seizure of the mines. Instead of complying, 325,000 bituminous and 75,000 anthracite miners quit work on May 1

The government seized the mines the same day. On May 4, 1943 full production was resumed, with manage ment operating the mines for the government. On May 25 the War Laboi board denied most of the miners' demands but increased their vacation pay and required the operators to pay for tools and other miners' equipment.

The miners rejected the board's decision and struck again on June 1, and the president again ordered them back to work. On June 7 the union officers ordered them back until June 30. The War Labor board reaffirmed its May 25 decision, and the miners struck a third time. On June 23 the union's officers again ordered the men back to work but the miners were slow to return. About 6,000, 000 man days were lost in the series of stoppages. The miners lost an average of 19 75 days, strikers in other in dustries lost an average of 5 days. Their strikes decreased the year's coal output by 21,750,000 tons of bituminous and 3 500,000 tons of anthracite.

The average duration of strikes dropped steadily from 1939 through 1943 In 1939 it was 23 days, 1940, 21 days, 1941, 18 days, 1942, 12 days, and 1943, 5 days.

Many of the 1943 strikes were spontaneous stoppages, and more than one half were for wage increases, register ing the widespread dissatisfaction of labour with the government's wartime wage stabilization policy.

Passage of the War Labor Disputes act by congress in June, largely as a result of the coal strike, made illegal strikes which interfered with war production until after a 30 day notice had been filed with the government and a formal strike vote had been taken under government supervision. In 117 strike ballots under government super vision during the latter part of 1943, 102 strikes were voted but only 34 actually occurred.

The relative importance of strikes in different industrial areas during 1943 is revealed by the figures on man days lost as follows

Mining (mostly coal)	9 370,000 days lost
Iron and steel	726,000
Automobile factories	441,000
Other transportation equipment	382,000
Textiles	306,000
Construction	140,827
Trade	90,711

The strike pattern of 1944 was different from that of 1943. Two thirds of the strikes occurred in manufacturing, with mining second in importance. In manufactures 6,148,117 man days were lost in 3,257 strikes; in mining 1,412,634 days in 893 strikes. The strike area was again concentrated geographically. In Michigan 39% of the industrial workers struck at some time during the year, in Pennsylvania 13%, West Virginia 12% and Illinois 7%

There were 16 strikes involving 10,000 people or more, as compared with 10 in 1943. The Detroit strike of 54 800 foremen attracted particular attention. It was the first large strike of foremen in US history Discontent over wages, lack of formal grievance procedures and discipline were the principal causes. The strike evidenced that foremen were not nearly so "management minded" as management had believed. There were at least 30 foremen's

strikes in 1944, involving 130,000 supervisors and 650,000 man-days lost.

Wages were the most important issue in the strikes of rank and file employees but involved much more than demands for "over-the-board" wages increases. Disputes over incentive systems, overtime, vacation pay and shift premiums were especially common. Working conditions and shop labour relations policies were next in importance. These included disputes over discipline, job assignments, job security, work loads, work schedules, shift arrangements and safety conditions. Union security, including union recognition, efforts to get a closed shop, expansion of the rights of union representatives and reforms in grievance procedure were a part of the causes of many major disputes.

Cut-backs in war production contributed to the causes of 35 strikes in 1944—forerunners of what was to come in 1945 and 1946. Loss of overtime pay, transfers to lower-rated jobs and the application of seniority provisions were typical factors in "cut-back strikes."

In 1944 more than one-third of the strikes were terminated by straight collective bargaining. These 1,653 strikes involved 488,827 workers. Government agencies assisted in the settlements of 2,942. In 2,373 some or all of the issues had to be negotiated further after the strikers returned to work. In 822 of these cases the issues were referred back to the parties for negotiation; in 147 they were submitted by the parties to private arbitrators; and in 1,404 they were discussed further with government conciliators or boards. In 347 no settlement was reached during the year.

In 1945 there were 4,750 strikes and more strikers than in any other year after 1919; 10,000,000 more man-days were lost than in any other year after such figures had begun to be compiled in 1927. The previous peak was 1937.

Coal was again the most important strike area, with 670 strikes, 678,000 strikers and 6,234,000 man-days lost. The automobile industry had the worst experience of any manufacturing group—185 strikes, 473,700 strikers and 7,308,000 man-days lost. The rubber industry had 123 strikes, 248,000 strikers and 1,521,000 man-days lost. Iron and steel had 817 strikes, 425,000 strikers and 3,731,000 man-days lost; while textiles had 187 strikes, 107,400 strikers and 1,456,000 man-days lost. This group of 4 closely related industries lost more than 14,000,000 man-days, an unprecedented occurrence in U.S. manufacturing. There were 342 transportation strikes, 157,000 strikers and 1,551,000 man-days lost.

Pennsylvania's and Michigan's industries each lost more than 6,000,000 man-days; Ohio's more than 3,000,000; and California's and Illinois's above 2,500,000 man-days. Whether examined industrially or geographically, the strike picture in 1945 was one of concentration of a major part of the strike activity in basic industries and major industrial states.

Half the strikes involved basic wages and hours but were generally complicated by union efforts to obtain actual or virtual closed shop situations. "Fringe issues," such as holiday and vacation pay, changes in the administration of incentive wage systems and payment for travel time, were of increased importance—a trend which began in 1943. The fringe issues were responsible in 1945 for a larger percentage of workers being idle and man-days lost than were demands for straight wage increases. In 1942, 6% of total man-days lost were on account of fringe issues; in 1945, 22.8%.

Efforts to obtain collective bargaining rights for supervisory workers also increased in importance. They were a

major feature of the organization drive in 1945.

The number of strike ballots conducted by the National Labor Relations board increased to 1,445; and in 1,249 such ballotings the employees voted to call strikes—an enormous increase over that of the previous year. But only 213 strikes followed such ballots. They accounted for 15,015,000 man-days lost—39.7% of all strike idleness in 1945. Wages were an issue in three-quarters of these strikes. The postwar wage conflict was getting under way.

In the automobile and tire industries 17 strikes each involved more than 10,000 strikers. The largest, which included employees of Chrysler, Ford, Packard and Budd Wheel company, involved a jurisdictional dispute between U.A.W. (C.I.O.) and A.F. of L. building trades over reconversion of buildings. In this strike 47,000 were out. Chrysler had 16,000 men out in February in a dispute over production standards.

Briggs, A.C. Spark Plug, Hudson, Goodyear Tire and Rubber company, General Motors and Wright Aeronautical company all had important disputes over discipline and, or alleged discriminatory suspensions or discharges. The mine workers had 164,000 men out in portal-to-portal pay disputes. Libbey-Owens and Pittsburgh Plate Glass had 16,000 men out in 5 states over incentive pay; and Goodrich Tire and Rubber company had 21,000 employees on strike in an effort to force union participation in setting up wage rates, awarding wage increases and revision of the merit system. Chrysler corporation had 19,000 out on a demand for clean-up time. Eleven major strikes were for "over-the-board" wage increases. Textile mills in 5 eastern states had 16,000 out in November for a closed shop, increased wages and vacations after a strike in September for wage increases. The foremen's union at B. F. Goodrich called out 14,000 foremen in September because of some lay-offs. The diversity of issues, and particularly the increased variety of issues as compared with the period before 1937, was apparent in these important strikes.

First Postwar Year.—During the first 11 months of 1946 there were 4,335 strikes, involving 4,545,000 workers and loss of 107.475,000 man-days, more than 9 times the loss of time in the corresponding 11 months of 1945 and nearly 13 times the corresponding man-day loss of 1944. The strike epidemic continued into December with the coal strike and other major strikes in full swing when December began. The maritime strike of September, the stubborn Allis-Chalmers strike (which had continued, by Dec. g1, for more than 8 months), the coal strike and the New York trucking strike were the outstanding disputes in the latter part of the year. Overshadowing all others was the coal strike in which the federal government hailed John L. Lewis, president of the United Mine Workers, into court in contempt proceedings on Nov. 27 and obtained a judgment of \$10,000 fine against Lewis and \$3,500,000 fine against the union.

The miners were ordered back to work by Lewis shortly after the fines were imposed, and the U.S. supreme court took immediate jurisdiction over the case to decide the legality of the action of the lower court. The supreme court on March 6, 1947, upheld judgment against Lewis and the union, but reduced the latter's fine to \$700,000.

The wave of important strikes in the early part of 1946 had subsided by August. In February 21,500,000 mandays were lost: in August only 1,712,000. Then came the maritime strike in September, the Trans World Airline (T.W.A.) pilot strike, bus strikes, the Pittsburgh public utility strike and the coal strike.

199

Armed guard watching U.S. soldiers hoard a Philadelphia streetcar as the army took over the Philadelphia Transportation company in Aug. 1944. The strike, involving 6,000 workers, paralyzed transportation in the city from Aug. 1–6

Measured in terms of workers involved and resulting idleness, work stoppages in Jan. 1946 exceeded any previous month in the nation's history. About 500 strikes were in progress, the largest being the strike at General Motors which started on Nov. 21, 1945, and the strikes involving the electrical manufacturing and meat-packing industries. These three accounted for about three-fourths of the strikers and of total strike idleness in January.

Wages, and their relationship to prices and profits, were the most important issues in these and many other labour disputes.

On Jan. 21, 1946, another major strike broke out, the largest on record. The steel industry was shut down by a walk-out of 750,000 members of the United Steel Workers of America (C.I.O.). They demanded a wage increase of 52 per day. More than 1,200 iron, steel and aluminum plants were directly involved. An agreement between the union and U.S. Steel was reached on Feb. 15, with an 18.5 cents per hour wage increase, with a price increase of \$5 per ton allowed by the government. By Feb. 19, 450,000 steel workers had returned to work; the remainder awaited clarification of the government's wage-price policy. Approximately 200,000 electrical workers struck at 75 plants on Jan. 17-also for a S2-a-day increase. General Electric, Westinghouse and the electrical division of General Motors were involved. General Motors settled for 181/2 cents an hour on February 9. The General Electric strike was settled on March 18 for the same wage increase plus some inter-occupational adjustments of inequalities, an improved vacation plan and a more satisfactory overtime pay plan. The Westinghouse strike (75,000) continued through March.

The Allis-Chalmers strike, which began on April 28 at the Milwaukee plant, and at dates close to April 28 in six other of the company's plants, was still going at Milwaukee at the end of the year, though it had terminated at other of the works. It involved wages only as a secondary issue. The company refused demands for a closed shop, freedom of union representatives to move about in the shops without control by foremen, submission of wage issues to a referee and modifications in grievance procedure and discipline desired by the union.

A series of strikes in the maritime industry virtually paralyzed all shipping in the east, west and gulf states during most of September. The disputes started in protest against a refusal by the National Wage Stabilization board to approve negotiated wage increases for two A.F. of L. maritime unions which exceeded the \$17.50 per month the board had approved on June 14 for the National Maritime union (C.I.O.) and several other unions. The decision applied only to government-owned vessels. Between Sept. 5 and 7 all major ports on three coasts became strikebound. As one union after another became involved, these issues became more complicated. The A.F. of L. and C.I.O. were both alert to secure any benefits obtained by the other federation, and the employers were caught in a situation where they had to bargain separately with powerful unions from both federations and then, perhaps, to yield

to each set of unions all the gams each had obtained itself plus all that its rivals had obtained. On Sept. 30. after settlement had finally been reached in the disputes involving the seamen, firemen, oilers, water-tenders, cooks and stewards, the masters, mates and pilots (A.F. of L.), and National Marine Engineers (C.I.O.) went out.

A maritime strike on the Great Lakes in August made 5,000 seamen idle for a week. It followed several months of negotiations and it caused a serious disruption of the commerce of the Great Lakes region.

On May 23, 1946, the first widespread strike of the operating brotherhoods on the railroads after 1888 occurred and for two days the nation's railroad system was tied up The strike was the final chapter in a series of three threatened strikes over wages in 1941, 1943 and 1945. Under pressure of a strike threat the railroad-operating brotherhoods had obtained a 91/2 cents per hour increase, and nonoperating occupations 10 cents in 1941. Early in 1943 the operating brotherhoods demanded a 30% increase, and after months of controversy a strike was set for Dec. 30. The railroads were seized by the government on Dec. 27. and on Jan. 17, 1944, both nonoperating and operating occupations got another increase. In 1945, 20 unions (nonoperating and operating) served notice of further demands, and a 16-cent increase on April 3, 1946, brought them up to the full 33% increase allowable under the costof-living formula in an executive order of Feb. 14, 1946. On May 23, 1946, the brotherhoods struck for further wage increases. The roads had again been taken over by the government on May 17 as a precaution against the impending strike. But the strike occurred anyway. After two days it was called off, and the issues were submitted to further negotiation between the government, the railroads and the brotherhoods.

The ten-day strike at the R. H. Macy & Co. stores in July of 1946 had unusual causes. It was precipitated by transfer of their delivery service, together with their drivers and helpers, to the United Parcel Service, Inc. The Macy employees were members of a C.I.O. union of wholesale and department store employees, while United Parcel had a closed-shop contract with the A.F. of L. teamsters. The C.I.O. union claimed that the transfer was a violation of its agreement with Macy's. The dispute was settled when Macy's agreed to extend to the transferred deliverymen benefits which accrued to the store employees under the C.I.O. agreement, as well as any general wage increases given to the store employees during the life of the existing agreement. These included such matters as vacations, pension rights, severance pay and overtime and other wage benefits which might exceed the terms of the A.F. of L. agreement. The transferred deliverymen were also given a separate seniority roster. With these securities guaranteed, the C.I.O. deliverymen then joined the A.F. of L. teamsters en masse and a ten-man joint A.F. of L.-C I.O. council was set up to consider the common problems of the two groups of deliverymen.

The complexity of the patterns of strike issues from 1943 to 1946 indicated that a new era had arrived in collective bargaining; one in which unions sought to negotiate on everything touching the interests of employees and were willing to resort to strikes on matters formerly left to management to decide.

Strikes in Great Britain.—It is apparent from Table III that Great Britain did not experience a strike epidemic comparable with that of the United States. From 1938 through 1942 British labour unions kept strikes at a minimum and concentrated on war production. From 1943 onward the number of strikes and strikers increased, but

only in 1944 was there strike activity approximating that of 1987.

The loss of man-days, 1938-13, was at the average annual rate of 1.311.000 days—only 38.2% of the 1937 manday loss and 36.2% of the 1911 loss. The first eight months

Table III.—Great Britain Number of Strikes, Number of Strikers and Man-Days
Lost. 1937–46 (8 months)

Year	Number of strikes, begin- ning in year or month	Number of workers made idle by the strikes begin- ning during year	Number of man-days lost in all stoppages in progress during year
1937	1,129	597.000	3,410,000
1938	875	274,000	1,330,000
1939	940	337,000	1,360,000
1940	922	299,000	940,000
1941	1.251	360,000	1.080,000
1942	1,303	457,000	1,530,000
1943	1,785	557,000	1,810,000
1944	2,194	821,000	3,710,000
1945	2,293	531,000	2,840,000
1946 (8 mo.)	1,498	369,800	1,496,000

of 1946 indicated that the strike record for the year would approximate the 1945 record

The industrial distribution of surkes followed a fairly consistent pattern. Coal mining, engineering, the iron and steel industry, transportation and shipbuilding were the major areas of industrial conflict.

The long established procedures for government mediation and arbitration of labour disputes caused the stoppages to be terminated more quickly than in the United States, even when final decision of the issues was not achieved at once.

The industrial distribution of the labour disputes of 1913, 1944, 1945 is shown in Table IV. The industrial distribution of strikes in earlier years was closely similar, the principal difference between years being in the degree of strike activity in coal, engineering, dock work and shipbuilding.

The only large strikes in 1937 were in the Yorkshire coal industry, where 400,000 man-days were lost by 95,000 miners; and 2 strikes of engineering and shipbuilding apprentices involving 10,000 and 14,000 apprentices and causing a loss of 370,000 man-days. Thirty thousand engineers and shipbuilders struck for one day in moral support of the apprentices.

In 1938-43 the only major disputes were 2 coal strikes in 1940, involving 20,000 and 26,000 miners; and in 1943, extensive strikes in coal and engineering. In 1944, 170,000 miners in 7 areas went out because an arbitration tribunal rejected their demand for increased piece rates. They lost 850,000 man-days.

The engineering, metal and shipbuilding trades lost a quarter of the total number of days lost in 1944. Their disputes started with demands for wage increases, and then spread "in protest against the prosecution and imprisonment of certain shop stewards for their participation in the strike of aircraft workers," a total of 400,000 man-days lost.

The strike tempo picked up sharply in 1945. Disputes in the transport industries caused more than one-half of the total man-days lost during the year. In March 55,000 days were lost by dock workers in a dispute over a new method of checking in when they came to work and over other disciplinary matters. The dock workers lost another 1,100,000 man-days in disputes over increases in wages, shorter hours and working conditions demands. In late September and much of October longshore work was stopped in many of the important ports.

*Some workers, chiefly in the coal mining industry, were involved in more than one stoppage, and therefore have been counted more than once in the year's total.

Compiled from tabulations appearing in Ministry of Labour Gazette: London

In May more than 6.000 London street railway and bus operatives struck against new time schedules, and in July 6,500 more were idle in other areas for the same reason. In aircraft manufacturing there were strikes over piece rates and output bonuses.

In coal there was only one large dispute, in which 16,000 miners lost 180,000 man-days over wage demands.

Canada.—Strike activity was moderate in Canada except in the years 1937, 1943, 1945 and 1946 (Table V). The strike pattern of Canada in 1945-46 was similar to that of the United States and was undoubtedly influenced by the

Table V.—Canada: Number of Labour Disputes, Workers Made Idle and Man-Days Lost, 1937–46

Year	Number of disputes	Number workers made idle	Number of man-days lost
1937	278	71.905	886,393
1938	147	20,395	148.678
1939	122	41,038	224,588
1940	168	60,619	266,318
1941	231	87,091	433,914
1942	354	113,916	450,202
1943	402	218,404	1,041,198
1944	199	75,290	490,139
1945	197	96,068	1,457,420
1946 (9 months)	178	126 436	4 040 434

U.S. situation. Many of the important industries of Canada continued to be related through ownership to U.S. industries, and many important unions were also integral parts of U.S. international unions. The sharp increase in the number of man-days lost, in spite of a smaller number of strikes in 1945-46, was a noticeable feature of the Canadian strike history of those years. From the middle of 1945 through 1946 there were widespread, large and often prolonged strikes in the automobile, rubber, electrical, metals manufacturing, chemical, metal and coal mining and textile industries.

The Ford strike, Sept. 12-Dec. 20, 1945, was finally arbitrated by a judge of the supreme court who denied the union an all-union shop but granted a compulsory checkoff from the pay of all employes, whether members of the union or not.

The issues were identical with those being pressed in the larger strikes in the United States-increased wages, shorter hours, closed shop, seniority rules, check-off, liberal vacation plans, payment for legal holidays, resistance to discipline and protests against government wage policies. (See also Business Review; Labour Unions; Law; National LABOR RELATIONS BOARD.) (D. D. L.)

Stritch, Samuel Alphonsus

1945

Cardinal Stritch (1887-), U.S. Catholic prelate, was born Aug. 17, 1887, in Nashville, Tenn. Ordained to the priesthood in Rome in 1910, he became chancellor of the Nashville diocese in 1913. Upon his appointment in 1921 as bishop of Toledo, he became the youngest member of the Catholic hierarchy in the U.S. Nine years later, he was appointed archbishop of Milwaukee and in 1939, he headed the archdiocese in Chicago, succeeding to this office after the death of George Cardinal Mundelein. During World War

II, Stritch was active in organizing relief for war victims and directed a national campaign for shipment of canned foods to Europe and Asia. He was also chairman of the Bishops' War Emergency and Relief committee and supervised distribution of the large sums raised for relief purposes by U.S. Catholics. One of the archbishop's tenets was to distribute the food to all the needy "regardless of creed or political belief."

In his views on foreign affairs, he was a confirmed internationalist and he signed an inter-faith statement calling for international organization with economic and social controls. Under his direction, the archdiocese charity program expanded. He was elected chairman of the administrative board of the National Catholic Welfare conference in Nov. 1945. Msgr. Stritch, whose nomination to the Sacred College of Cardinals was announced Dec. 23, 1945, was created cardinal at the consistory of Feb. 18, 1946.

Strontium

The demand for strontium during the decade 1937-46 continued to be satisfied mainly by celestite, the sulphate. While pyrotechnics, tracer bullets and flares accounted for some of the increase in demand during World War II, a good share of the expansion was caused not by the need for strontium, but for a substitute for barite in oil well drilling mud. Beginning with 1940, the first year of production since 1918, the United States supply was as follows in short tons:

											_	Shipments	Imports
1940												350	2.751
1941												4,724	4.294
1942												4,041	10,387
1943												7,566	16,881
1944												3,005	5,793
1945	٠											2.784	3,691

Previous to 1940, the imports of celestite were supplemented by the importation of 200-350 tons of strontium chemicals from Germany. Demand for war uses reached a peak in 1943, with the consumption of 13,387 tons in the production of strontium chemicals. (G. A. Ro.)

Subasitch, Ivan

Subasitch (1890-), Yugoslav politician, was born at Velika Gorica, near Zagreb. A graduate of the University of Zagreb, he received a doctor of law degree. Drafted into the Austro-Hungarian army during World War I, he was taken prisoner on the Russian front and later joined Serb forces fighting the Russians. After the collapse of the tsarist armies in 1917, he was sent to the Salonika front.

Subasitch joined the Croat Peasant party after the war; when Croatia was granted autonomy Subasitch became ban (governor) of Croatia in 1939, a post he held until the German invasion in 1941. After the collapse of the Yugoslav armies he fled to the United States and maintained residence in New York city, N.Y. Subasitch returned to Europe in May 1944 and the following month was asked by King Peter II to form a government. After conferring with Marshal Tito and reaching agreement on points of dispute, Subasitch formed a government July 7, 1944. In Nov. 1944 he conferred with Joseph Stalin in Moscow on the problems involved in establishing a policy that would prove satisfactory to both Great Britain and the soviet union.

On March 7, 1945, Tito completed his new cabinet and appointed Subasitch as foreign minister. But Subasitch quit the Tito government on Oct. 8, 1945, for "reasons of health." Unofficially, he was said to have resigned after a dispute with Tito over "undemocratic" electoral laws.

Submarine Warfare

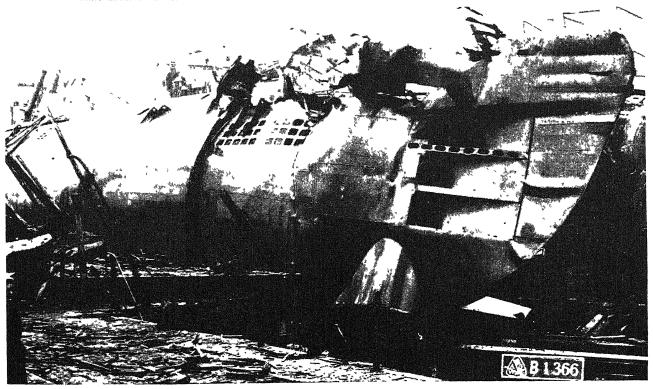

The submarine played a paradoxical role during World War II—it was either saint or sinner, depending not on its deeds or misdeeds but on the flag it flew. In the Atlantic, the German submarines were stigmatized as the rattlesnakes of the deep—the one great menace that must be wiped out if the Allied cause were to succeed. Concurrently, the United States submarines in the Pacific and the British submarines in the Mediterranean, conducting a similar type of warfare, were hailed as the defenders of democracy. The German analyst could undoubtedly inter-

U-Boat construction yards, including those at Hamburg, Emden, Kiel and Bremen, were major objectives of the R.A.F. and U S.A.A.F. during World War II. This picture, bearing the stamp of an official German photographer (lower right), shows a submarine destroyed while under construction at Bremen change the above designations with commensurate logic. The fact is that the submarines constituted a powerful offensive weapon, exploited by both the axis and the Allies with equal disregard for the prewar rules for submarine employment under international law. The Allies might rightfully argue that the Germans started the game and established the rules, and to justify this argument it is necessary to review briefly the status of undersea warfare at the outbreak of World War II.

The Battle of the Atlantic

It was the original intent of the Germans to limit the war to Poland by not inflaming the British or French people. Adolf Hitler hoped that, in spite of their declaration of war, Great Britain and France would accept the conquest of Poland as a fast accomple and that a major conflict could be avoided. Accordingly, to the U-boats at sea on Sept. 3, 1939, the German naval staff passed detailed orders for the conduct of the war. Merchant ships were to be attacked only in accordance with the rules of international law. Over and above this, Hitler expressly forbade attacking or stopping any passenger ship, or any ships of French nationality. Despite these orders an overeager U-boat captain sank the "Athenia" less than nine hours after declaration of war. The reaction to the sinking was immediate—it was only a matter of days before Great Britain began to arm its merchant vessels, and hasty preparations were made for the resumption of all U-boat defenses which the Allies had used during World War I. When these steps became evident, Germany, during the latter part of September, declared its intention of sinking all British ships without warning.

Germany had neither desired nor prepared to wage unrestricted submarine warfare. When Hitler came into power in 1933, he did not consider any of the great naval powers to be among the future opponents of Germany and

consequently he emphasized the building up of the wehrmacht and the air force. The naval service was not considered to be on a par with these other branches and had little or no influence in matters of high policy. It was Hitler's intention to create a small homogeneous fleet capable of matching the naval power of the U.S.S.R. or France, and no real effort was made to build up a large U-boat arm. Admiral Karl Doenitz, the German submarine expert, did strive for technical developments and added emphasis on submarines but was largely overruled, he then being of only captain's rank. As a result of this policy, the German navy at the outbreak of World War II consisted of the following units, in commission or nearing completion in the building yards: 4 battleships-"Scharnhorst," "Gneisenau," "Bismarck" and "Tirpitz"; 2 pocket battleships-"Scheer" and "Graf Spee"; 2 aircraft carriers-"Graf Zeppelin" and "B"; 5 heavy cruisers—"Hipper," "Bleucher," "Prinz Eugen," "Luetzaw" and "Seydlitz"; 30 destroyers; 76 submarines.

The submarines were of three general types:

	Type IX C	Type VII C	Type II
Surface displacement .	740 tons	500 tons	250 tons
Cruising radius (at 10 knots)	7,000 miles	6,000 miles	5,000 miles
Maximum submerged spe	ed 8 knots	8 knots	7 knots
Maximum surface speed	18 knots	16 knots	13 knots
Armament	ó torpedo tubes	5 torpedo tubes	3 torpedo tubes
	1 4 in. gun	1 3.5 in. gun.	1 AA machine gun
	2 AA machine guns	1 AA machine gun	·

With the decision to conduct unrestricted submarine warfare the Germans hastened to apply the techniques and operating methods they had developed in World War I. The plan for building a homogeneous fleet was drastically changed, and an increased U-boat construction program was ordered, concentrating on the 740-ton and 500-ton types. Whereas previously the monthly output had been 2 or 3 U-boats, the new construction was expected to bring production to 25 monthly within two years.

Initially the Germans concentrated their submarines in the vicinity of the British Isles, making attacks submerged in daylight from periscope depth. The tactics were highly aggressive, and each U-boat scored heavily against Allied shipping. One of the early successes was the sinking of the aircraft carrier, H.M.S. "Courageous," in the western approaches of the Atlantic on Sept. 17, 1939. The "Courageous" had been operating with British antisubmarine forces. Following this success the U-boat command determined on a bold plan of attack against ships in harbours and close in to the coast line. The plan included submarine operations in Scapa Flow, Moray Firth, the Firth of Forth, the Shetland passages, Loch Eue, Liverpool and the Bristol channel.

For the operation against Scapa Flow, an air reconnaissance was conducted, and detailed plans for the penetration of the harbour were prepared. The mission was entrusted to one of the most able submarine commanders, Kapitan-Licutenant Gunther Prien of U-47. In mid-October U-47 successfully penetrated the anchorage and sank the British battleship "Royal Oak." Torpedo failures denied Prien further successes against the anchored British fleet in this bold and brilliantly executed performance. In the operations against the Firth of Forth, the cruiser "Belfast" was torpedoed and damaged; at Loch Eue, the battleship "Nelson" was similarly damaged. The other planned operations were abandoned after several fruitless attempts.

During the first ten months of World War II, the average number of U-boats at sea in the Atlantic was 6; the average number of ships sunk monthly by them was 26. to-

talling about 106,000 tons. The principal factor in keeping Allied shipping losses low was the prompt institution of the convoy system and the rapid organization of all available antisubmarine forces into an antisubmarine warfare command.

By the conquest of the Netherlands, Belgium and France in May and June 1940, Germany gained a strategical naval position of great importance, and conditions became particularly favourable for the employment of submarines. The possession of the Bay of Biscay ports eliminated the long journeys to and from the hunting areas which had taken up much of the cruising radius of the U-boats. The sea routes were at the front door of the U-boat command, resulting in almost doubling the number of submarines that could be maintained on patrol stations.

By the fall of 1940, the danger of invasion of England had passed, and the British navy intensified its antisubmarine measures, while the royal air force was used on an increasing scale for guarding shipping routes. It became increasingly difficult for the U-boats to operate close into shore, and convoys were located less frequently. To counter these Allied defenses, the U-boat command instituted a method of group control of U-boats which permitted wide dispersion of the submarines for search, and heavy concentration for attacks. These so-called "wolf-pack" tactics were developed in the certain knowledge that location of the Allied convoys would be the greatest problem. Once a convoy was located, headquarters would direct the assembly and mass attacks of the submarines. Coupled with the wolf-pack tactics the Germans began their night surface attacks against Allied shipping. At night, trimmed down to decks awash, the submarine offered a very small silhouette to the human eye and was very difficult to detect by either radar or sonar. Having made its attack, the submarine would use its high surface speed to escape the convoy escorts, and diving was resorted to only in an extremity.

As a result of the new building program, coupled with the capture of the Biscay ports, the number of German submarines at sea increased from 6 in 1939 to 36 in mid-1941, and to as high as 93 in Jan. 1942, with 40 additional submarines available for operations in the Mediterranean and in the Barents sea, which were used for cutting the Allied supply lines to Libya and to the U.S.S.R. After the entry of the United States into the war in Dec. 1941, it was natural for the U-boats to head westward to search for weak spots in the Allied defenses. In their initial raids, the U-boats inflicted heavy losses in the areas off the eastern seaboard of the United States.

The first ten months of 1942 were by far the most successful of the war for the German submarines. The total world-wide losses suffered by the Allies during that period amounted to 878 ships of 4,587,000 gross tons. The main U-boat battle was fought in the Atlantic, where about 90% of the losses occurred. However, in this same period the Germans lost 78 submarines to the ever-increasing efficiency of the Allied antisubmarine forces. While the Germans could replace their submarine losses, they could not replace their experienced crews, and the effectiveness of the individual submarine decreased. The Germans then changed the locale of their concentrated attacks to the gap in the northwest Atlantic, where the U-boats could operate against the vital transatlantic convoys in a region beyond the range of Allied air cover. It was in these areas that the crucial war of the Atlantic was fought, and eventu ally won by the Allies through the employment of hunterkiller groups of escort carriers accompanied by a number of destroyer escorts. The carriers' planes would hunt and scek out the U-boats and vector the destroyer escorts into position to administer the coup de grace.

Between Oct. 1942 and June 1943, 112 U-boats were sunk in the Atlantic and 37 in the Mediterranean, with aircraft accounting for 76 of the total. Coupled with the severe losses, the expansion program for the U-boat fleet began to slow down as the Allied air forces' bombing began to take effect. The bombings of the construction yards and the U-boat pens seriously restricted new construction. But even so, the U-boat menace to the Allies continued as a major threat, for the Germans still had about 400 submarines in commission in mid-1943.

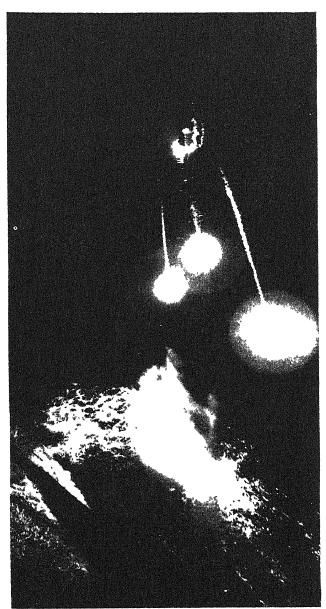

By late 1943, the Germans were forced to admit that the rate of submarine losses had become so great as to stop their operations effectively; reorienting their thinking, they sought to develop a submarine design that would permit operating beneath the surface most of the time, be highly manoeuvrable, and able to operate at great depths. As an interim measure the Schnorkel was developed for installation on U-boats in service. The Schnorkel was an extensible engine-breather pipe which permitted the submarine to operate her Diesels submerged at slow to moderate speeds, to charge her batteries submerged, and to replenish the air supply inside the boat. To allow the installation of the Schnorkel, as well as other devices designed to counter antisubmarine measures, the Germans withdrew many of the U-boats from the North Atlantic.

From late 1943 until May 1944, the U-boats were employed in a widely dispersed campaign in the Caribbean, off Brazil in the South Atlantic, and off Freetown, South Africa. Until all U-boats could be Schnorkel-equipped the U-boat command hoped to gain time and minimize losses by operating in these widely dispersed areas which they considered relatively weak in antisubmarine measures. The plan met with little success. The Allied antisubmarine forces continued to increase in number and efficiency and there were few, if any, ocean areas that they did not patrol. Consequently, the losses continued to mount—from July 1943 to May 1944, a total of 199 submarines were destroyed at sea by the antisubmarine forces.

The U-boat reverses at sea were only part of the perilous war situation which confronted the nazis on all fronts by the fall of 1944. The loss of France through the Normandy landings was a setback of utmost gravity to the U-boat warfare. The submarines had to fall back on the Norwegian and home bases and, as in the beginning, the long passage from these bases to the Atlantic shipping lanes absorbed a major portion of the submarine's cruising radius. In addition, the U-boats could no longer attempt surface running—the long journey to the hunting areas had to be made for the most part submerged.

In the final phase, U-boat operations resembled those of the early months of the war. Operating from bases in Norway and the Baltic, the submarines hunted in the waters around the British Isles. In these waters the Schnorchel-equipped U-boats were able to operate in inshore waters with relative safety from aircraft detection. At first they achieved some successes, but eventually the weight of the Allied antisubmarine forces became overwhelming and finally forced the U-boats from the coastal areas. The submarine then was no longer practicable as an offensive weapon against Allied antisubmarine measures.

The battle of the Atlantic, in which the Allies won a final victory over the U-boats, came to an end with the German capitulation on V-E day. A total of 781 German submarines had been sunk, with a loss of approximately 30,000 men from a total personnel of 38,000. But, from the German viewpoint, these men did not die in vain—their

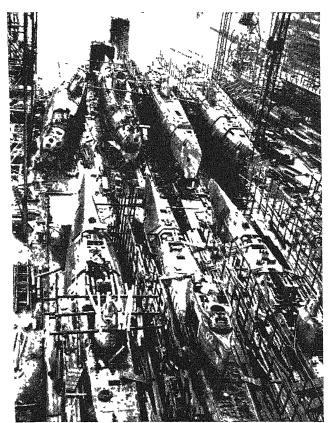

Night flares dropped above a German submarine by an R.A.F. coastal command plane flying at 75 ft. The flame-burst in the fore-ground was from an exploding depth charge

successes were outstanding and represented a large portion of the price of the Allied victory. They had sunk more than 2,500 Allied ships of about 14,500,000 gross tons, including two battleships, two aircraft carriers and numerous destroyers and escort vessels.

Admiral Karl Doenitz, the commander of the U-boats for almost the entire war, stated that the battle of the Atlantic was lost before it began. Germany, he said, was in no way prepared to fight a naval war against Great Britain. Had Germany adopted a realistic policy it would have had 1,000 U-boats available at the beginning of the war. Considering the depredations which his submarines committed on the Allies and how near to victory they were in the Atlantic, one is bound to recognize the fearful consequences which undoubtedly would have resulted had the Germans carried out such a realistic policy.

The U.S. Submarine War

In the halcvon days of 1930, Baron Kijuro Shidehara,

Shipways at Bremen harbour, where about 40 German submarines in all stages of construction and repair were captured by the Allies in 1945

foreign minister of Japan, had stated: "the number of submarines possessed by the United States is of no concern to the Japanese inasmuch as Japan can never be attacked by American submarines . . ." Eleven years later the baron's beliefs were still shared by the Japanese militarists, as was evidenced by the pattern of the attack on Pearl Harbor. The bombs and torpedoes were for the battleships and for the carriers which they hoped would be present. They could not be expended on such inconsequential targets as submarines and submarine repair facilities. The submarine base at Pearl Harbor and the few submarines based therein were ignored by the attacking planes. It was a fatal mistake.

The reasoning of the Japanese strategists was difficult to comprehend. They well knew of the effectiveness of the German submarines against the British, both in World War II and in the previous one, and Japan's position in the western Pacific was analogous to that of the United Kingdom in the eastern Atlantic-an island empire dependent upon ship-borne cargoes for the prosecution of a war as well as for the maintenance of the domestic economy. The ships bringing raw materials to the home islands and those providing logistic support for the outlying bases were the bloodstream of the Japanese war potential. The submarines, which the Japanese high command overlooked or underestimated, applied the tourniquet to that stream; the outlying bases became gangrenous and fell prey to amphibious assault. Long-range bomber forces moved into these captured bases and they, together with carrier air forces, which were free to roam the seas after the decimation of the Japanese navy by submarine, air and surface attacks, forced the empire of the mikado into acceptance of unconditional surrender. Had the submarines with their base at

Pearl Harbor and their tenders in Manila bay been destroyed in the initial attacks on those places, as easily they might have been, the submarine war against Japan would have been retarded many months. Had the Japanese devoted more of their prewar effort to the development of antisubmarine weapons and to training in antisubmarine methods, the submarine results would have been greatly curtailed. While the defeat of Japan was inevitable in any event, the war would have lasted much longer without the submarine achievements and have been far more costly in both men and material.

The United States government had strongly condemned the unrestricted warfare conducted during World War I and being conducted during World War II by the German submarines. It was opposed by U.S. public opinion, as well as by government policy. Yet, within six hours after the first bomb fell on Pearl Harbor, despatch orders from the chief of naval operations directed the submarines to conduct "unrestricted warfare against Japan." The United States had cut its pattern to fit its cloth. With the bulk of the fleet incapacitated at Pearl Harbor, the submarines were the one effective weapon available, and Japan had aligned itself with the powers that sanctioned unrestricted warfare. And, though the orders permitted attacks without warning on merchant ships, actually there were no merchant ships as such in the Pacific after the war began. All Japanese shipping was engaged in the prosecution of the war-either carrying men and munitions and equipment to the areas under attack or occupation, or carrying the raw materials to manufacture more munitions and more equipment. "Transports," "freighters," "tankers," were just other names for unarmed, or poorly armed combatant ships. Considered in that light, the directive to attack this shipping did not involve such an about-face as it appears at first glance. However, it did come as a surprise to the submariners who had been taught to believe that in the event of war they would be required to abide by the provisions of the London Naval treaty, 1930, which stated:

... a warship, whether surface vessel or submarine, may not sink or render incapable of navigation a merchant vessel without having first placed passengers, crew, and ship's papers in a place of safety....

But, though surprised, they were not caught napping. The submarines were well trained and well organized, and they were ready for war, or as ready as the peacetime ships of a peace-loving nation could be. With their all-embracing directive, they stood out to carry the war to the Japanese. On Dec. 15, 1941, the first confirmed submarine sinking of a Japanese ship occurred—that of the 8,663-ton "Atsutusan Maru," which fell victim to "Swordfish" off Hainan island in the South China sea. Three years and eight months later "Torsk," operating in the Sea of Japan, accounted for the last two victims of the war just a few hours before the cessation of hostilities. Between these sinkings, about 1,750 steel merchant vessels (not counting ships of less than 500 tons) and 94 major men-of-war were sunk by submarines.

Submarines vs. Japanese Merchantmen.—To inaugurate the submarine campaign, the United States had a total of 51 submarines available in the Pacific at the time of Pearl Harbor. They were of two general classes—the fleet submarines, each carrying the name of a fish, and the older and smaller S-class, with numerical designations rather than names. Twenty-three of the former and 6 of the latter class were based in the Philippines, while 16 fleet type and 6 S-class were based at Pearl Harbor. The fleet submarines were not of a homogeneous type. They represented the results of 20 years of experiment to determine the most suitable type of submarine for operations in the Pacific. However, they all had one thing in common. They

were all capable of long periods of sustained cruising. being able to remain at sea for periods up to 75 days and to cover about 10,000 miles at normal cruising speeds without refuelling or revictualling. On the other hand, the Sclass submarines, built primarily for defense purposes in the years following World War I, were comparatively short-legged and incapable of covering the vast expanses of ocean required for Pacific patrols, while their lack of airconditioning made them unbearably hot for submerged patrolling in tropical waters. The submarines of this class based at Pearl Harbor were transferred to the Aleutians to patrol those subarctic regions where distances were short and the waters cold. Those based in the Philippines made a number of patrols in that area and later, with their base moved to eastern Australia, they operated in the Solomons and New Guinea area but finally they also were translened to the Aleutians.

These 51 submarines had a Herculean task assigned them. Their patrol areas extended from the Aleutians southward to the Solomons, New Guinea and the Dutch East Indies, and from Midway westward to the coast of China and French Indo-China. It was their task to drive Japanese shipping from these 8,000,000 or more square miles of ocean. Experience soon proved that not more than one-third of the 51 could be maintained on patrol station simultaneously (the other two-thirds being either en route to or from station or undergoing refit or overhaul); the submarine effort was spread exceedingly thin. However, the 20 years of experiment in submarine design had culminated the year before Pearl Harbor in the evolution of the "Gato" class submarine which, with minor refinements dictated by war experience but no basic changes, remained the standard class for all wartime construction, thus simplifying and speeding up submarine production. As fast as new submarines of this class could be turned out of the building yards they were sent to augment the submarine fleet in the Pacific. Thirty-six (plus 11 S-class transferred from the Atlantic) were added in 1942, 52 in 1943 and 76 in 1944. With each addition, the intensity of the Pacific submarine war increased.

The campaign against Jap shipping introduced many new elements foreign to the prewar training curriculum. To the submarine captain, thoroughly trained in attacks on high-speed, well-screened, zigzagging men-of-war, attacks on eight-knot, poorly-protected Jap convoys offered no serious difficulties. But there were other phases of this type of warfare not so readily assimilated. It took many months to learn that having missed his target, or sunk only a part of the convoy, the submarine could wait until the enemy was out of sight, surface in broad daylight, make a high speed "end around" and attack again. It took longer still to learn that a submarine could steal silently into a convoy on the surface at night, sink two or three ships, and escape at high speed without even diving, and perhaps repeat the performance a few hours later on the convoy remnants. But the technique was finally mastered and the success of the submarine warfare was attested by the record of Japanese ships sunk. Up until the end of 1943, the submarines accounted for 73% of Japanese ship losses from all causes. Subsequent to 1943, this percentage dropped, not because of any lessening of the submarine effort, but rather because of an increase in sinkings by other agencies, mainly carrier aircraft and, during the closing months of the war, mines laid by B-29s in the Inland sea. The previously mentioned sinking of "Atsutusan Maru" marked the initial point on an ever-rising curve of submarine sinkings. This curve reached its peak in Oct. 1944, during which month 110 ships (exclusive of ships less than 500 tons) were sent to the bottom by U.S. submarine attack. The curve then tapered off because of a paucity of Japanese shipping.

The original plan for the employment of submarines was to place them at the focal points of Jap shippingthe entrances to Tokyo bay and the Inland sea, and off Truk, Palau, the Marianas, the Bonins and Ryukyus and the important harbours of Formosa, the Philippines and Dutch East Indies. With so many focal points and so few submarines initially available, not all productive areas could be covered, but none of them was totally neglected. A submarine would work one spot until it had made its presence known by sinking a number of Jap ships and would then move to another area to confuse the Japs and cause them to diffuse their antisubmarine forces. As the number of submarines increased, more and more of the vital areas were patrolled simultaneously until, by the fall of 1943, the saturation point was reached. Submarines then started operating in co-ordinated attack groups, or "wolf packs," as they were called. Three or four submarines under a wolf-pack commander embarked in one of them would co-ordinate their patrols, maintaining radio contact with one another. The first submarine of a group to make contact with Jap ships would trail and vector its packmates into contact positions before making its attack. Rarely were the attacks co-ordinated-after all submarines of the group were in contact with the Japs, each would attack independently. Wolf packing served a triple purpose-it permitted greater density of submarines in an area without interference with one another; it multiplied the effectiveness of each submarine by permitting it to act on contacts of its packmates as well as its own; and it reduced the severity of Japanese countermeasures. The escort commander could not concentrate his escorts on the first submarine to attack when his charges might be attacked a short time later by another submarine of the pack.

The ultimate in intersubmarine co-ordination was attained by a hastily organized pack of two boats. The story merits the telling. Early in Jan. 1944, "Seawolf," commanded by Commander R. L. Gross, on patrol in the East China sea, reported that it had sunk three ships and that it had but three torpedoes remaining from its original 20. The force commander directed it to return to Pearl Harbor, patrolling en route until its remaining torpedoes were expended. Two days later "Seawolf" contacted a southbound convoy of four ships protected by three escorts. With its three torpedoes, it sank one ship of this convoy and as soon as the usual depth-charging subsided it surfaced and commenced trailing the three remaining ships, sending an urgent dispatch for another submarine to join it and destroy the covey it had flushed. The closest submarine at the time was "Whale," Commander A. C. Burroughs commanding, patrolling off the Bonin Islands about 400 miles to the eastward. It was ordered to proceed at maximum speed to intercept "Seawolf's" convoy. Two days later "Whale," acting on information from "Seawolf," made contact, and with the latter watching through its high periscope from its position beyond the horizon, sank two of the three remaining Japanese ships. The escorts promptly started depth-charging "Whale" while the last Jap ship attempted to flee unescorted to the southwest. Gross, determined that no ships of this convoy would escape, made a high speed end-around to a position ahead of the fleeing ship where he opened fire on it with his three-inch gun. The gunfire had the desired effect; the ship reversed course to rejoin its escorts, who in the meantime had broken off

their attacks on "Whale," permitting it to surface. It reestablished radio contact with "Seawolf" who vectored it into position to destroy with torpedoes this last ship of the convoy.

The Japanese used relatively small convoys—usually four or five ships escorted by from one to four destroyers or destroyer escorts-and there were many instances where a single submarine destroyed an entire convoy unassisted. The first of such instances was that of "Wahoo" who, on Jan. 26, 1943, contacted an unescorted four-ship convoy in the area north of New Guinea. That night, "Wahoo's" commanding officer, Lieutenant Commander Dudley W. Morton, reported "... in ten-hour running gun and tor-PEDO BATTLE DESTROYED ENTIRE CONVOY OF TWO FREIGHTERS ONE TRANSPORT ONE TANKER X ALL TORPEDOES EXPENDED X RETURNING HOME . . . " Two days previously, "Wahoo" had penetrated the Japanese-held port of Wewak on the New Guinea coast to sink a destroyer therein, and this may have accounted for his finding an unescorted convoypossibly the destroyer had been the one designated as escort. The day following the convoy battle, "Wahoo" encountered another convoy. With all torpedoes expended, Morton trailed in the hope of picking off a straggler with gunfire. The attempt was thwarted by one of the escorting destroyers who detected "Wahoo" and chased it off. Morton then sent his classic dispatch "... ANOTHER RUNNING GUN I IGHT X DESTROYER GUNNING X WAHOO RUNNING . . . "

There were several cases in which submarine commanding officers, using the Mohammed-and-the-mountain principle, entered Japanese harbours to seek their prey. The "Wahoo's" penetration of Wewak mentioned above was one of them, but it was not the first. As early as Nov. 1942, "Seawoll," then commanded by Commander F. B. Warder, penetrated Davao gulf in the southeastern Philippines to sink "Sagami Maru" at anchor off Taloma wharf, about 50 miles from open water. The outstanding attack of this nature was that of "Barb," which in the dark of the night of Jan. 22-23, 1945, penetrated 20 miles of water too shallow for diving to attack a group of 30 Japanese ships at anchor in Namkwan harbour on the coast of China. "Barb" fired eight torpedoes in this attack and escaped undamaged through a rain of shells from exploding ammunition ships. The following day, a press despatch from Chungking, China, reported a naval engagement off the China coast, and so it was-30 Japanese ships versus U.S.S. "Barb." Its commanding officer, Commander E. B. Fluckey, was awarded the congressional medal of honour for this outstanding performance.

By the spring of 1945, submarine and air attacks had well-nigh cleared the seas of Japanese shipping, but there still remained one important area where Japanese shipping travelled virtually unmolested—the Sea of Japan with its many ships plying the waters between Korea and the Japanese home islands. During the summer of 1943, several submarines had entered that sea to patrol therein but the patrols were discontinued because of the risks involved. All the entrances to the Sea of Japan were known to be mined and with equally as productive areas elsewhere the risks of transversing these mine fields were not warranted. However, by the spring of 1945, the other productive areas no longer existed, and the Sea of Japan remained the one great challenge to the submarines. Foreseeing this trend of circumstances, the submarine force commander inaugurated a series of exercises to train submarines to underrun anchored mine fields. Early in June, nine submarines, formed into three wolf packs, simultaneously passed

through the mme fields of Tsushima strait to enter the Sea of Japan. They remained for nine days to sink 32 Japanese ships, including one submarine, for a total of more than 100,000 tons. It was the last great submarine offensive. While the submarine patrols continued until the end of hostilities two months later, and there were a number of desultory sinkings, the submarines had successfully completed their assigned task of driving Japanese shipping from the sea.

Whenever the opportunity offered, submarines attempted to rescue survivors from the ships they had sunk. Their efforts were usually resisted by the Japanese themselves who, with their suicidal complex and their inherent desire to die for the emperor, preferred death to rescue by the enemy. On several occasions submarines had to employ force to bring survivors on board; on three occasions survivors committed suicide after having been voluntarily rescued. The Japanese psychology was impossible to fathom.

While the over-all effect of the submarine war against shipping was known, the value of any individual attack was impossible to appraise. For man-of-war sinkings, the value could be judged by the size and type of the victim, but the same did not hold true in the case of the merchantmen. The lowliest tramp steamer might be carrying the most vital cargo. Two examples will suffice to illustrate this point. (1) When carrier aircraft made their first attack on presumably impregnable Truk, the air crews were pleasantly surprised by the weakness of Truk's antiaircrast defenses. Questioned about this point after the cessation of hostilities, Captain Tamura, air staff officer at Truk, stated that the weakness was caused by lack of radar control for the guns, and when asked the reason for this lack, he stated that the ship bringing in the radar control equipment was sunk by submarine off Guam. (2) Japanese authorities generally agreed that the loss of Saipan was the turning point of the war. On June 6, 1944, "Shark II" and "Pintado" decimated a Saipan-bound convoy in the waters northwest of the Marianas. The U.S. forces landed on Saipan nine days later. The campaign was touch-and-go with the issue in doubt for several weeks. Postwar information revealed that the ships sunk by "Shark II" and "Pintado" were carrying a division of troops to reinforce Saipan and that less than half that division, completely devoid of equipment, succeeded in reaching the island. This division of troops, fully equipped, might well have been sufficient to weigh the balance in favour of the Japanese.

Submarines vs. the Japanese Navy.-From the point of view of the individual submarine, the campaign against the merchantmen and that against the Japanese navy were one and the same thing. The two went hand in hand. The submarine on patrol station in Japanese waters attacked whatever came its way, be it freighter or man-of-war, with the latter always the target of preference. The war of attrition against Japanese merchantmen throttled Japan's economy and weakened the island outposts. The attacks on the Japanese navy had the more immediate effect of reducing the offensive and defensive strength of the fleet. With but a few notable exceptions, the majority of sinkings of important Japanese combatant ships took place during 1944. Unknown at the time, this late start was not because of any failure of the submarines, but rather because of faulty torpedo exploders which, activated magnetically by the induction of a ship's hull, while effective against merchantmen, had a tendency to explode from 30 to 50 yards away from the side of large combatant ships, causing only superficial damage.

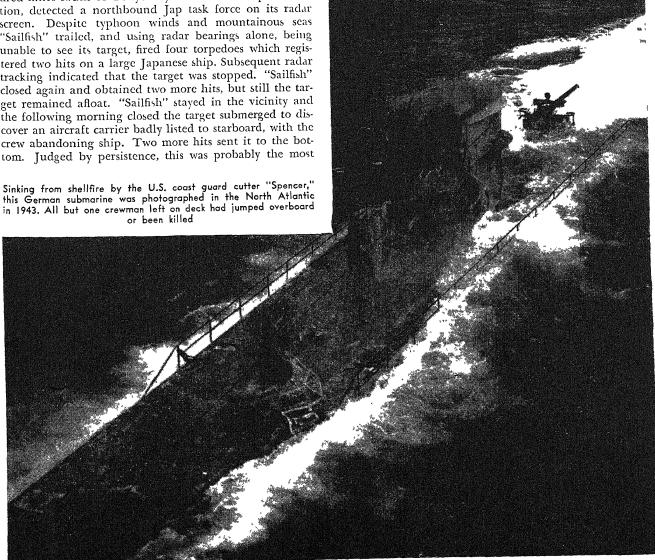

The first notable success was that of "Nautilus," which

during the battle of Midway in June 1942, sank the aircraft carrier "Soryu." "Soryu" had been severely damaged by carrier planes and was dead in the water when finished off by "Nautilus," commanded by Lieutenant Commander W. H. Brockman. Brockman was credited with an "assist" only on this sinking. Two months later "S-44," patrolling off Kavieng under the command of Lieutenant J. R. Moore, sent the heavy cruiser "Kako" to the bottom with all hits from a salvo of four torpedoes. Three days previously "Kako" had been a member of the force that had administered the greatest setback to Allied naval forces during the war. On the night of Aug. 7, the United States heavy cruisers "Vincennes," "Quincy" and "Astoria," and the Australian heavy cruiser "Canberra" were sunk off Tulagi in the Solomon Islands. "Kako" was returning from that engagement when it fell prey to "S-44."

Following the sinking of "Kako," 16 months elapsed before the next large. Jap man-of-war was sent to the bottom by submarine attack. In the meantime, the torpedo exploder faults had been detected and by late summer of 1943 had been corrected. (It should be noted that "Nautilus" had sunk a previously wounded carrier, while "S-44" was using contact exploders not subject to the faults of the magnetic exploders used by the fleet-type submarines.) On the night of Dec. 3, 1943, "Sailfish," passing several hundred miles south of Tokyo bay en route to its patrol station, detected a northbound Jap task force on its radar screen. Despite typhoon winds and mountainous seas "Sailfish" trailed, and using radar bearings alone, being unable to see its target, fired four torpedoes which registered two hits on a large Japanese ship. Subsequent radar tracking indicated that the target was stopped. "Sailfish" closed again and obtained two more hits, but still the target remained afloat. "Sailfish" stayed in the vicinity and the following morning closed the target submerged to discover an aircraft carrier badly listed to starboard, with the crew abandoning ship. Two more hits sent it to the bot-

outstanding sinking of the war-the series of three attacks had covered a period of ten hours, and Lieutenant Commander R. E. M. Ward, making his first patrol as a submarine commanding officer, had proved his mettle. The ship was the escort carrier "Chuyo," and there was tragedy as well as triumph connected with its sinking. "Sailfish" was the name given to "Squalus" after that ill-fated submarine, which sank during its trial runs off Portsmouth, N.H., had been raised and rebuilt. When it sank, during May 1939, the submarine which located it and stood by during its salvage was "Sculpin." Postwar information disclosed that "Chuyo" at the time of its sinking by "Sailfish" was carrying 21 of the total of 41 survivors of "Sculpin," which had been sunk about two weeks previously by Japanese action off Truk. Of these 21 on "Chuyo," only 1 survived the "Sailfish" attacks.

The banner year for submarines in their campaign

against the Japanese fleet was 1944. With the exception of May, not a month of that year passed without at least one important Japanese man-of-war being destroyed by submarine action. The first four months of the year each saw a light cruiser go down. In January, it was "Kuma," sunk by H.M.S. "Tallyho" off Penang, British Malaya. In February, the new light cruiser "Agano" fell victim to "Skate" north of Truk on the eve of the first carrier air attack on that island stronghold. The following day, carrier dive bombers sank the destroyer "Maikaze," which was bringing in survivors from the "Agano" sinking. In March, "Tatsuta" was sunk by "Sandlance" south of Tokyo bay, while the following month "Yubari" went down from torpedoes fired by "Bluegill."

Important as were these sinkings, they were but apéritifs for those which were to take place during the last seven months of the year. With the start of the amphibious oftensive in the Pacific, the submarines were no longer free to conduct their free-lance war of attrition in Japanese waters. While these offensive patrols were continued on a reduced scale, a considerable portion of the submarine effort was devoted to the support of the amphibious landings. For each operation, submarines were placed in positions to intercept Japanese fleet units that might attempt to oppose the landings. The mission of the submarines was twofold-to report Japanese fleet movements, and to attack, with report the primary mission. The submarines' orders required that "in the event of contact with a previously unreported major enemy force moving toward the area of operations your first duty is to send a contact report." These orders were universally unpopular with the submarine captains. For the first submarine to make contact, the order to send a contact report before attacking precluded the possibility of a successful attack. The burning ambition of every submarine captain was to torpedo and sink a capital ship, and these orders were depriving him of his rightful heritage. Before a message could be drafted and enciphered, and the submarine could surface and transmit it, the ship would be far over the horizon. However, the fleet commanders insisted upon these orders. From their vantage point the damage that could be inflicted by a single submarine, important as it might be, could not possibly outweigh the value of a contact report which might prevent a surprise attack upon the hundreds of ships involved in an amphibious operation.

For both the Gilberts and the Marshalls campaigns, the submarines were stationed to guard all the entrances to Truk, and in positions between Truk and the Gilbert and Marshall islands, as it was reasoned that if the enemy fleet attempted to oppose the landings it would either come from, or stage through, Truk. The Japanese fleet did not attempt to oppose the landings in either of these campaigns and the submarine efforts, involving about ten submarines in each case, appeared to be wasted. However, for the next operation, the Marianas campaign, the plan paid big dividends.

At the time of the landings in the Marianas, in June 1944, the bulk of the Japanese fleet was known to be anchored in Tawi Tawi bay in the southwestern Philippines. To reach the Marianas from there, the Japanese would have to pass to the north or to the south of the Philippines, or through either San Bernardino or Surigao straits. To watch the Japanese fleet and to guard all the avenues of approach to the Marianas, three submarines were stationed in the vicinity of Tawi Tawi, three north of Luzon and three south of Mindanao (the northernmost and southern-

most Philippines), while one was stationed at the castern entrance to San Bernardino strait and another at the eastern entrance to Surigao strait. In addition, five submarines were stationed to the northwest of the Marianas to guard the approaches from the Japanese empire while others, as available during the operation, patrolled in the vicinity of the Palau islands and in the waters between the Philippines and the Marianas.

First information on Japanese movements came from "Harder," who on the evening of June 10, reported that three battleships, four or more cruisers and six or eight destroyers had departed Tawi Tawi on a southerly course. Subsequent information indicated that this force proceeded to an anchorage off the island of Halmahera. "Redfin," also at Tawi Tawi, made the next contact report—this time on the striking force which contained the carriers. On the evening of June 13, it reported that a force consisting of six carriers, four battleships, eight cruisers and six destroyers had left Tawi Tawi that morning and had headed north. The Japanese fleet was underway, but was it coming out to fight? The question was answered two days later by "Flying Fish."

"Flying Fish" had been maintaining a lonesome vigil at San Bernardino strait for weeks and was nearing the end of its patrol endurance. Its fuel was running low, but it held out waiting for relief to arrive. Perseverance was rewarded. On the evening of June 15, it reported that shortly before sunset the force previously reported by "Redfin" had passed through San Bernardino strait and had proceeded slightly north of due east at a speed of 20 knots. The die was cast! The long-hoped-for fleet engagement was in the offing. But what of the southbound force reported by "Harder" on June 10? "Seahorse" sent in the answer within a few hours.

While "Flying Fish" had waited weeks to make its all-important contact, "Seahorse" made its quite by accident. It wasn't included in the submarine disposition for this operation but was passing east of the Philippines en route to its station in Luzon strait after fuelling in the Admiralty Islands. Shortly after the "Flying Fish" message arrived at fleet headquarters in Pearl Harbor, an urgent message from "Seahorse" stated "... TASK FORCE IN POSITION 10°-11' NORTH, 129°-35' EAST, COURSE NORTHEAST SPEED SIXTEEN POINT FIVE KNOTS ... SEAHORSE TRAILING...." Soon thereafter, it reported that its speed had been reduced by main motor trouble and that it had lost contact and had given up the chase.

The two forces were located but they were still a long way from the Marianas. They would undoubtedly fuel before striking. Where would they rendezvous with each other and with their tankers, and from what direction would they strike? These questions also were answered by the submarines, this time by "Cavalla."

"Cavalla," a new submarine making its first patrol, was en route to San Bernardino strait to relieve "Flying Fish." Upon receipt of the latter's contact report, "Cavalla" was ordered to patrol temporarily across the estimated track of the striking force. An hour before midnight on the 16th, it made radar contact with a convoy which later was determined to consist of one large and one medium tanker with three destroyers for escort, on an easterly course making 16 knots. "Cavalla" gained position ahead for an attack but had to abandon the approach when detected and forced to go deep by one of the escorting destroyers. An hour and a half later it was on the surface to transmit its contact report. It then proceeded on the way to San Bernardino strait. "Cavalla" had failed to grasp the importance of the convoy it had contacted. Normally, a Japa-

nese convoy in these waters would have little implication, but at this time, the only islands to the eastward being the Marianas, and they under attack by the U.S. fleet, these tankers could have but one possible mission-to fuel the Japanese fleet, and the position of that fuelling was the one bit of information vitally needed by the U.S. forces. And, if the tankers could be destroyed, the Japanese fleet would be slowed by lack of fuel and become easy prey for the carrier planes. As fast as the message could be drafted, orders were sent to "Cavalla" ". . . DESTRUCTION THOSE TANKERS OF GREAT IMPORTANCE X TRAIL X ATTACK X REPORT." "Cavalla" reversed course and started the chase at maximum speed, holding out little hope for success. It would take two days to overtake the tankers even if it knew where they were heading. The following morning, subsequent orders directed it to discontinue the high speed chase but to continue along the track at normal cruising speed.

"Cavalla's" adventures were only beginning. At 8:00 in the evening of June 18, it found itself directly on the track of the battleship force previously reported by "Harder" and "Seahorse." Knowing the need for definite information concerning the Japs, "Cavalla" rightfully elected to report rather than attack. The battleships passed directly over it without suspecting its presence. Two hours later, "Cavalla" was sending out its vital message. With its receipt, the fleet commander had sufficient information concerning the Japanese, and submarines were relieved of the restriction to "report before attacking." The following morning, "Cavalla" received its just reward for forbearance. Shortly before 11:00 o'clock on the morning of the 19th, "Cavalla" contacted the Jap carrier force. Now it was free to attack. The results are best decribed in its terse radio report of the ensuing action "... HIT SHOKAKU CLASS CARRIER WITH THREE OUT OF SIX TORPEDOES AT ZERO TWO ONE FIVE (11:15 A.M.) X ACCOMPANIED BY TWO ATAGO CLASS CRUISERS THREE DESTROYERS POSSIBLY MORE X RECEIVED ONE HUNDRED FIVE DEPTH CHARGES DURING THREE HOUR PERIOD X SUPERSONIC GEAR OUT OF COMMISSION X HULL INDUCTION **FLOODED X NO OTHER SERIOUS TROUBLE X SURE WE CAN HAN-**DLE IT X HEARD FOUR TERRIFIC EXPLOSIONS IN DIRECTION OF TARGET TWO AND ONE HALF HOURS AFTER ATTACK X BELIEVE THAT BABY SANK ..." The carrier proved to be "Shokaku," one of Japan's three largest carriers in commission, and it did sink. In a brand new submarine, and making his first attack as a submarine commanding officer, Commander Herman J. Kossler had attained the submarine hall of fame.

Unknown to either "Cavalla" or to the submarine force commander, another event of equal import had taken place just three hours earlier and about 60 miles distant from "Cavalla's" attack. On this same eventful morning of June 19, "Albacore," with Commander J. W. Blanchard commanding, was patrolling on the surface in the vicinity of 12°-20' north 137°00' east. Shortly after 7:00 o'clock it was forced to dive to avoid detection by a Jap plane. At 7:50 it sighted through the periscope an aircraft carrier, a cruiser and the tops of several unidentified ships. The range was 13,000 yards, and "Albacore" was 70° on the carrier's port bow. From such a position an attack was impossible—the carrier would pass well outside torpedo range. However, Blanchard manoeuvred for position, hoping that a favourable zigzag would bring the targets toward him. While attempting to close the range a periscope sweep of the horizon disclosed a second carrier group of similar composition. "Albacore" was 10° on the bow of the second carrier, an ideal attack position. This was a horse of another colour, and Blanchard forgot about the first group to concentrate on the second. At 8:08 he was 1,500 yards on the target's beam and ready to fire when he noted

that his fire control equipment was not indicating a correct solution to the problem. No sadder fate ever befell a submarine captain—one of the prize targets of the war crossing his bow at 27 knots and something was wrong. In a situation such as this, there was little time for thought; within two minutes the target would be beyond reach. It was now or never. Blanchard quickly estimated a solution, angled his torpedoes, and using a wide torpedo spread to compensate for the probable errors in his estimate, fired six torpedoes. He then ordered deep submergence to avoid the counterattack which he knew was coming. Two minutes after firing, "Albacore" heard what was believed to be a torpedo hit. However, at this stage of the war, hits that were heard but not seen were given slight credence. Disappointed in his results, Blanchard neglected to report this attack by radio. It was not until a month later when the patrol report was received that it came to the attention of the force commander, who credited "Albacore" with probable damage to a "Shokaku" class carrier. But the gremlins that had deprived Blanchard of his rightful quota of hits regretted their caprices and paid off in full. When "Cavalla" made its attack three hours later on what was obviously a combination of the two groups sighted by "Albacore," there was only one carrier in the formation-the other carrier must be in difficulty somewhere. Months later, information received from a Japanese prisoner of war disclosed that "Taiho" had been sunk on the morning of June 19. Information gathered after the end of hostilities proved beyond all doubt that the one chance hit from "Albacore" had, after six hours, resulted in a gasoline explosion which sent this newest of carriers to the bottom on the very day that it launched its planes for its initial attack on the U.S. forces.

There were two submarine commands operating against Japan-the Submarine Force Pacific fleet, based at Pearl Harbor, and Commander Submarines Southwest Pacific, based on the east and on the west coast of Australia, with headquarters at Perth. June 19, 1944, was the high point of the war for the former command. At that time, Japan had only three first-line carriers in commission, "Taiho," "Shokaku" and "Zuikaku," and within the space of three hours "Albacore" and "Cavalla" of the Pearl Harbor command had sent two of these three to the bottom in the initial and crucial phase of a fleet engagement. But the submarines of the Southwest Pacific were not to be outdone. They too had their day of glory, equal in importance to June 19. Some four months later, on Oct. 23, the day preceding the start of the battle for Leyte gulf, submarines of that command put four heavy cruisers out of commission, sinking two of them and sending the other two limping back to port, never again to see action during the war. But before describing these actions it should be mentioned that in these intervening four months, four light cruisers and two escort carriers were destroyed by submarine action. On July 19, "Flasher," patrolling the South China sea, sank the light cruiser "Oi." Aug. 7 marked the end of "Nagara" through action of "Croaker" in the waters north of the Ryukyus. As evidence of this sinking, "Croaker's" commanding officer, Commander J. E. Lee, brought back a reel of motion pictures taken through the periscope of this light cruiser's last moments. Eleven days later another light cruiser, this time "Natori," was sunk by "Hardhead" in the area east of the Philippines. On this same date "Rasher," operating to the north of these same islands, sank the escort carrier "Taiyo." Less than a month later another escort carrier, "Unyo," fell vic-

tim to "Barb" off the island of Hainan. On Sept. 19, "Shad," stationed south of the main Japanese island of Honshu, sank "Ihojima," the ex-Chinese cruiser "Ninghai" which the Japanese had captured and converted to their own use. By this time the supply of light cruisers as targets for submarines was running low—the next successes were against the heavy cruisers previously mentioned.

The initial landings for the recapture of the Philippines were made on the island of Leyte on Oct. 20, 1944. At this time the Japanese fleet was based at Singapore and submarines of the Southwest Pacific command were disposed in intercepting positions between Singapore and Leyte gulf. The Japanese had their fleet plans for defense of the Philippines and were quick to react. At midnight on the night of Oct. 22-23, "Darter" and "Dace," on station in Palawan passage, that long narrow strip of water between the banana-shaped Palawan island and the unexplored Dangerous Ground to the westward, were within hailing distance of each other, and their respective commanding officers, Commanders D. H. McClintock and B. D. Claggett, were discussing plans for the next day's operations when "Darter" made radar contact with a large Japanese force at a range of 30,000 yards. McClintock, the senior of the two, gave deployment instructions to Claggett, and "Darter" and "Dace" proceeded at full speed to their positions. "Darter" drew first blood. At 5:32 A.M., from the starboard side of the Jap formation, and from a range of 980 yards, it fired six torpedoes from its bow tubes at the heavy cruiser "Atago." Torpedoes could hardly miss from that range. Not waiting to see his results, McClintock swung hard left and one minute later fired his four stern tubes, this time at the heavy cruiser "Takao." With all tubes empty, "Darter" could take no more offensive action until they could be reloaded. Mc-Clintock ordered deep submergence to reload and to evade the depth charging which was as certain to follow as night the day, but before doing so he took a quick look at his first target. It had been hit with five torpedoes and, billowing smoke from forward turret to stern, was already well on the way to its final resting place. While going deep, McClintock heard three hits in his second target, with a fourth explosion, about 25 seconds later than scheduled, which might possibly have been a hit in a third ship. "Atago" sank. "Takao" was severely damaged but succeeded in reaching Singapore. The last explosion was not explained-it was possibly the sixth torpedo of the first salvo exploding at the end of its run.

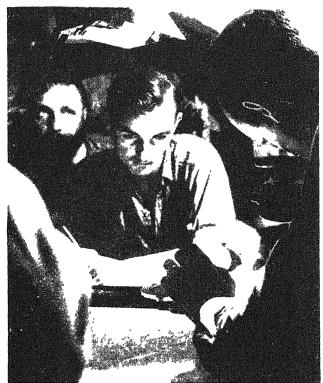

Meanwhile "Dace" was closing the Japs from the port flank. Twenty minutes after "Darter" fired her first salvo, "Dace" got off six torpedoes at "Maya." The resulting four hits sank this heavy cruiser within a few minutes.

Now it was the Japs' turn. The depth charging of "Dace" lasted for four hours; that of "Darter" for one. Neither sustained material damage, but it was early afternoon before their hecklers departed and they could return to periscope depth to take stock of the situation. They found the horizon clear with the exception of the damaged "Takao," which was heading slowly southward escorted by three destroyers. An attempted submerged attack by "Darter" was thwarted by these escorts. Both submarines surfaced after sunset and immediately embarked on a high speed chase to catch and destroy the crippled cruiser. At five minutes after midnight, on the morning of the 24th, "Darter," not having had opportunity to fix her navigational position within the past 24 hours, and making full speed in pursuit of "Takao." ran hard

aground on Bombay shoal, a submerged reef to the westward of Palawan passage. A hurried despatch brought "Dace" to her assistance. "Dace," seeing there was no possibility of refloating "Darter," who was so high out of the water that its propellers were exposed, removed all "Darter's" crew and then expended all its remaining torpedoes in an attempt to destroy its helpless sister. The attempt failed-the torpedoes exploding on the rocks before they could reach their target. "Dace" then sprayed "Darter" with 21 hits from its three-inch gun to damage it beyond salvage by the Japanese. After being brought home by "Dace," the entire crew of "Darter" was ordered to the new submarine "Menhaden," then building at Manitowoc, Wis., in order to maintain intact this fighting organization which had inflicted such severe damage on the Japanese. The damage was actually greater than was known or suspected at the time. Postwar information revealed that "Atago," sunk by "Darter," had been the flagship of the Japanese fleet, and Admiral Kurita had been forced to shift his flag to "Yamato" on the eve of the greatest naval engagement in history.

On this same morning that "Darter" and "Dace" were carving their niches in history, another submarine, "Bream," commanded by Commander W. G. Chapple, on patrol off the entrance to Manila bay, was further reducing the force which was to challenge the U.S. landings on Leyte. At 1:10 A.M. Chapple sighted two heavy cruisers, with destroyer escorts heading south from Manila bay, evidently to join the forces contacted by "Darter" and "Dace." Six torpedoes fired by "Bream" at 3:24 A.M. sent the heavy cruiser "Aoba," wounded with two hits. limping back into the bay. In this case, as in the case of "Atago," the damage was tantamount to sinking. While the Japanese expended great effort to repair "Aoba" and "Atago," they were still disabled when the war ended.

Four Jap cruisers put out of action was a good day's work for any organization. Submarines of the Southwest Pacific command had had their day of triumph and had proved their parity with the Pacific fleet submarines. But the story of the submarine part in the battle for Leyte gulf was still not complete. Submarines of the Pacific fleet were to get in their blows, unimportant as they might be as compared with the work of "Darter," "Dace" and "Bream." The main flect engagements took place on Oct. 25. The Japanese ships had approached through waters patrolled by Submarines Southwest Pacific, but if they attempted to reach Japan they would have to pass through the areas patrolled by the Pearl Harbor submarines. On the morning of Oct. 25, two submarine wolf packs of three submarines each were en route from Saipan to Luzon strait. The submarine force commander, seeing the battle shaping up, ordered these two groups to proceed at maximum speed into positions to intercept any Jap ships attempting to escape the fleet engagement. The positions chosen for these two groups were purely guesswork, yet strangely enough both groups made contact and both inflicted damage upon the Japanese. At 6:44 P.M., "Halibut" fired six torpedoes at what was believed to be a battleship of the "Ise" class and counted five hits. When "Halibut" surfaced a few minutes later nothing was in sight but a large upturned hulk. The Japanese records of this battle were very sketchy, and this sinking by "Halibut" was not confirmed. It was believed that it may have sunk a destroyer. At 11:00 o'clock the same evening "Jallao," of the other group, put three hits into a Japanese cruiser attempting to escape to the northward. It sank within a few minutes, witnessed by the group commander in "Pintado." It was the light cruiser "Tama."

Control room of a U.S. submarine in 1945 as crew members worked tensely on a problem while a Japanese ship dropped depth charges near by. Their only recourse was to shut off their motors and hope their position would not be detected

Following the battle, a number of the Japanese ships took refuge in Manila bay. On the morning of Nov. 6. a group of these ships, attempting to reach the Japanese homeland, ran afoul of the Southwest Pacific submarines—"Guitarro," "Bream," "Raton" and "Ray," all four of whom, in the order named, attacked the largest ship of the formation, the heavy cruiser "Kumano." Best available evidence indicated that it was "Ray" who inflicted the major damage. "Kumano" had its bow blown off and was immediately beached to prevent sinking. Its position, on the west coast of northern Luzon, was reported and on the 25th of the month, its destruction was completed by carrier planes of Admiral W. F. Halsey's 31d fleet.

Two escort carriers were the next victims on the submarine agenda. On Nov. 15, "Akitsu Maru," designed as an escort carrier but unsuccessful in that role and subsequently converted to an aircraft transport, was sunk by "Queenfish" in the Yellow sea. Two days later "Spadefish," operating in the same area and in the same wolf pack with "Queenfish," sank "Jinyo," the fifth and last escort carrier to fall victim to submarine attack. These sinkings were followed within a few days by the most important sinkings of the war, that of a battleship with a destroyer as a soupçon, and that of the largest aircraft carrier ever built.

Commander Eli T. Reich had an account to square with the Japanese. The first U.S. submarine lost to enemy action in the war was "Sealion," destroyed by aircraft bombing Dec. 10, 1941, while under overhaul at Cavite navy yard in the Philippines. Reich, a junior grade lieutenant at the time, was the engineer officer of "Sealion," and one of the two bomb hits, exploding in the engine room, killed four of his engineer ratings. "Sealion" was beyond salvage and had to be abandoned. Reich, a submarine officer without a ship, served for awhile on the

island of Corregidor but before the fall of that isolated stronghold he was evacuated by, and later assigned to duty in "Stingray." Subsequently, he was ordered to "Lapon" as executive officer. By the fall of 1943, he had worked up to command rank and was given "Scalion II," which was then being completed at New London, Conn. Now with his own command he was ready to exact retribution for the loss of his four engineers. Each torpedo that he fired carried one of the four names-Foster, Ogilvie, O'Connell and Paul, and like the Four Horsemen of the Apocalypse, each took a heavy toll. On its first patrol, "Sealion II" sank four Jap ships. On its second patrol it sank six. This patrol was noteworthy in that, in addition to the ships sunk, it rescued 54 British and Australian survivors from a Japanese prison ship which it had sunk three days previously. These survivors had spent more than two years in Japanese prison camps in Malaya and all were hospital cases, suffering from malnutration, scurvy and pellagra, as well as from the effects of three days' exposure to sun and water. Four of them died before "Sealion II," rushing at maximum speed, could reach port. (In addition to "Seahon II," three other submarines were involved in these rescues-"Pampanito," "Barb" and "Queenfish." Altogether, a total of 157 survivors were picked up, "Pampainto" alone rescuing 71.)

But Reich's greatest triumph was still to come. On the night of Nov. 20-21, 1944, "Sealion II" was patrolling north of Formosa, guarding the northern approach to Formosa straits. Twenty minutes after midnight its radar detected a group of three ships at a range of 44,000 yards -a phenomenal range for a submarine's radar-the ships must be big. Reich started tracking and as the range closed other ships showed up on the radar screen. Soon the situation clarified-contact had been made with a Jap task force consisting of a cruiser, two battleships and a second cruiser in column in the order named, with three destroyers as escorts (postwar information revealed that one of the ships identified as a cruiser was actually a third battleship, "Yamato," which explains the three ships originally detected by radar). By 2:45 A.M., Reich had determined the ships to be on course o60°, speed 16 knots, not zigzagging. He decided upon a surface attack -a hazardous method against an enemy task force. Detection would bring swift and severe retaliatory measures but, if undetected, surface action offered the greatest chances for repeated attacks on this important force. At 2:56, from a range of 3,000 yards on the Japs' port beam, six torpedoes from the bow tubes were fired at the first battleship. A quick reversal of course and three torpedoes from the stern tubes (the fourth stern tube being out of commission) were loosed at the second battleship. At 3:00 A.M. three hits were seen in the first target, and four minutes later a large and violent explosion was seen on what was believed to be the second battleship. The escorting destroyers dashed wildly to the eastward to depth charge some innocent whale, while "Sealion II," still on the surface, withdrew to westward to reload torpedo tubes and to prepare for another attack. Strangely, instead of slowing down, the Japanese formation increased speed. Whereas before it had been making 16 knots it was now making 18 and Reich, overloading his engines in an attempt to keep up, was slowly losing ground. While normally capable of 20 knots, a choppy head sea was slowing "Sealion II" to a maximum of 17. At 4:50 A.M. the break came. The Japanese formation split into two parts, three ships maintaining speed while the wounded battleship,

with two destroyers for escort, dropped astern. Radar tracking first showed the rear group to be making 12 knots, but shortly therealter indicated that the battleship was dead in the water. Reich, using the "bird in the hand" theory, abandoned his high speed chase to finish off the cripple. "Sealion II" closed to administer the coup de grace. The treatment was unnecessary. At 5:24, while still 12,000 yards from the crippled target, there was a tremendous explosion. The sky was brilliantly illuminated like a sunset at midnight. The target disappeared from the radar screen. It was "Kongo," the only Japanese battleship sunk by submarine attack during the entire war. Postwar information revealed that the fourth hit, rather than damaging the second battleship, had hit and sunk an intervening destroyer-"Urakaze." A battleship and a destroyer on one attack! Reich had collected his debt a hundredfold.

A newspaper hoax in the early stages of the war was the story of the U.S. submarine which lay in wait in Tokyo bay to torpedo a Jap carrier as it slid down the launching ways. Although vigorously and repeatedly denied, the story circulated rapidly and soon became a legend. But even were it true the deed of this legendary submarine could not compare with the less colourful but more important work of "Archerfish" in the early morning of Nov. 29. A carrier sliding down the launching ways is but partially completed, whereas the carrier sunk by "Archerfish" was on its trial run and nearing the stage when it would enter combatant service. On the evening of the 28th, "Archerfish," with Commander J. F. Enright commanding, was patrolling off Inamba Shima, south of Tokyo bay, when it made radar contact at 24,700 yards with a Jap force, later determined to consist of an aircraft carrier escorted by four destroyers. The base course was southwesterly, speed 20 knots, zigzagging radically. It was soon apparent that the force would pass outside of torpedo range-"Archerfish's" maximum speed of 19 knots was insufficient to permit closing. Enright parallelled the target's base course and sent out a contact report hoping to guide some other submarine into this juicy prize. His 19 knots, though insufficient to close, permitted him to keep up, the radical zigs and zags reducing the Jap speed made good. At 11:40 P.M., three hours after initial contact, the Japanese changed base course to the right. "Archerfish" on the port flank was left farther behind than ever. Enright sent out another contact report to give the new base course. The situation looked hopeless, but still "Archerfish" hung on. At 3:00 A.M., after more than six hours of maximum speed chasing, the Japanese made a radical change of course to the left and Enright found himself on the track of the formation. At 3:05, "Archerfish" submerged and started the approach. Twelve minutes later six torpedoes were fired from a position 1,400 yards on the starboard bow of the target. The four hits that resulted were all that were necessary. The Japs attempted to tow the cripple to port but it sank several hours later. Enright identified his target as a "Hayataka" class carrier of 20,000 tons. In the years immediately preceding the war, Japan had laid the keels of three superbattleships. Mounting 18-inch guns, they were to be the largest and most powerful combatant ships ever built. The first two were commissioned as "Yamato" and "Musashi." The third remained a mystery until the facts were learned at the end of the war. It had been converted to a carrier, named "Shinano," commissioned Nov. 18, and sunk by submarine attack on Nov. 29, while on its maiden voyage. Its full load displacement

was 71,890 tons. "Archenfish" had sunk the largest carrier ever built and the largest ship in history to go down from submarine attack.

The practice of sinking Jap carriers before they could see action was becoming established-first "Taiho" and now "Shinano." But there was to be a third, only 20 days after Enright's outstanding performance. On Dec. 15, 1944, as a prelude to the invasion of Luzon, U.S. forces landed on the island of Mindoro in the west-central Philippines. A Japanese task force, consisting of the heavy cruiser "Ashigara" and several destroyers, attempted to destroy the Mindoro beachhead. This force, lacking air cover, was easily beaten off and two of the destroyers were sunk. Survivors from these destroyers were captured and when questioned as to the absence of air cover they stated that the carrier which was scheduled to rendezvous with them had been sunk a few days previously by submarine attack in the East China sea. This time it was "Redfish," commanded by Commander L. D. McGregor, which had replaced "Sealion II" in the patrol area north of Formosa.

Shortly after noon of Dec. 19, "Redfish" was forced to submerge by the approach of a Jap plane. McGregor stayed down to await developments. Because of earlier attacks he had only four torpedoes remaining for his forward tubes, but still had his full quota of four in the tubes and four in the racks aft. At 4:24 P.M. the masts of two destroyers were sighted and three minutes later the top hamper of an aircraft carrier came into view. At 4:35, just eight minutes after the first sighting, McGregor fired his four remaining bow torpedoes at the carrier, and a moment later let go with four stern tubes at one of the escorting destroyers. These last four missed, but one torpedo of the first salvo caught the carrier in its engineering spaces. It stopped and listed to starboard. "Redfish" remained at periscope depth while a reload was started aft. McGregor's mental strain during the next few minutes probably was beyond description—a helpless carrier less than 1,000 yards away and all tubes empty. By 4:49, one tube was ready and judgment gave way to impatience. McGregor fired his single torpedo. It struck at the point of aim-just abaft the island superstructure. The torpedo explosion was followed immediately by an unearthly series of blasts. The torpedo had set off the aircraft bombs and the thousands of gallons of aviation gasoline. McGregor kept his periscope exposed to assure himself that the ship was doomed and to take photographs of his victim. One destroyer spotted him and rushed in for the kill. Deep submergence was ordered. While passing 150 feet, the blow struck. Seven well-placed depth charges exploded all around "Redfish." The bow planes jammed in the hard rise position, the steering gear jammed with rudder hard left; the hydraulic system, the gyrocompass and all listening gear were knocked out of commission. The pressure hull was cracked in the forward torpedo room. One of the torpedoes just loaded aft made a hot run in the tube to give off gases and noise as a continuous marker of "Redfish's" position. Several battery jars were cracked; there were numerous air leaks. "Redfish" settled to the bottom in 232 feet of water to await the final blows which all hands felt were sure to come. But they never did. The depth charging became progressively farther away. "Redfish" licked its wounds and after dark blew itself to the surface to work its way home for a well-earned and much-needed overhaul. Its companion on the bottom, the new carrier "Unryu," en route to its first combat action, remained. The air cover for the Mindoro bombardment force never arrived.

The campaign for the capture of Okinawa which started on April 1, 1945, was the last major operation of the war.

For this, as for all other major amphibious operations, submarines were again used to guard against surprise attack by Jap surface forces. But by this time, Japan had only lew capital ships. Not a first-line carrier remained in operating condition; the few that hadn't been sunk were under repair for damages inflicted by submarine or plane. A few cruisers were in Singapore, isolated from Okinawa and from the Japanese home islands by the U.S. occupation of the Philippines. All other remnants of the once proud Japanese fleet were based in the Inland sea, and submarines were stationed to watch the three entrances thereto-Bungo Suido, Kii Suido and Shimonoseki strait. Once again they had orders to "report before attacking." With all their losses the Japanese had one ace-in-the-hole remaining-the battleship "Yamato," the most powerful ship afloat. On the night of April 6-7, a task force consisting of "Yamato," the light cruiser "Yahagi" and seven destroyers, embarked on a suicidal attempt to break up the Okinawa landings. And suicidal it proved to be. Sortieing through Bungo Suido, the southwestern entrance to the Inland sea, they were immediately contacted by the submarines "Threadfin" and "Hackleback" who, in accordance with their orders, sacrificed their chances for attacking to trail at high speed and to send out a series of contact reports. Based on this information, planes of Admiral Raymond Spruance's 5th fleet caught the Japanese flatfooted the next morning. "Yamato," "Yahagi" and the destroyers, "Hamakaze," "Isokaze," Asashino" and "Kasumi" were sunk Only three destroyers escaped. For all practical purposes, it was the end of the Japanese navy.

But there still remained the cruisers at Singapore—"Takao," still out of commission from "Darter's" attack, the heavy cruiser "Myoko," with its stern blown off by the submarine "Bergall" on Dec. 13, 1944, the heavy cruiser "Ashigara" and the light cruiser "Isuzu." These last two were not to escape the submarines. The sun of April 7 that witnessed the destruction of the "Yamato" task force also saw, 2,000 miles to the southward along the Malay barrier, the end of "Isuzu," victim of three hits from six torpedoes fired by "Charr." "Ashigara" was the next and the last on the list of major combatant sinkings, victim of a British submarine, H.M.S. "Trenchant," commanded by Commander A. R. Hezlett, who destroyed it with five torpedo hits in a brilliantly executed attack in the shallow waters close into the coast of Sumatra on June 8, 1945.

* * *

IMPORTANCE of results was the criterion in selecting the actions described in the foregoing accounts. Space has not permitted the recounting of the many actions in which submarines sank 42 destroyers, 26 Japanese and 3 German submarines (exclusive of those sunk in European and Atlantic waters) and the countless minor combatant vesselsdestroyer escorts, coast defense vessels, destroyer minelayers, picket boats, etc. The stories of these many engagements lay buried in the mass of sixteen hundred odd submarine patrol reports, awaiting the future historian to bring them to light. That future historian would uncover many deeds of skill and daring-factors which could not be gauged merely by the size or importance of the victim. The fast weaving destroyer was more difficult to hit than the lumbering battleship; the enemy submarine and the small destroyer escort were hardest of all. And for intrepidity, who could excel the submarine captain (there were more than a few of them) who deliberately exposed his periscope to an enemy destroyer, to sink it as it charged down on him with bone in its teeth and depth charges set? Those stories were still untold. Soon after the war started,

submarines became known as the "silent service." Their activities and their successes were hidden behind a veil of secrecy. Anonymity rather than publicity was the watchword. They fought their battles in the Pacific, not in the daily press. An occasional communiqué announced that submarines had sunk several freighters or tankers, but rarely was the sinking of a combatant ship disclosed. Modesty had never been a national trait of the U.S. people, and the public, not understanding the submarine attitude, resented it. But it was self-preservation rather than modesty that dictated the policy. While naval vessels normally operated in groups, the submarine acted alone. Even when operating in a wolf pack, it seldom was in visual contact with its pack mates. The enemy was the only witness to the submarine's action. Rare indeed was the submarine attack which was not followed by vigorous countermeasures, and any announcement of the submarine's success would be prima facie evidence that it survived to tell the tale. The submarines could operate with relative impunity only as long as the Japanese maintained their blind faith in the lethality of their antisubmarine weapons. Any doubt would bring improvements and greater submarine losses. The silence policy paid huge dividends in lives of submarine personnel. Japan claimed 468 definite submarine kills. Actually, 52 U.S. submarines were lost during the war, only 42 of which could have been caused by enemy action. While these 52 submarines took a great toll of lives -approximately 16% of the total submarine operating personnel-the number was small as compared with the 781 submarines lost by the Germans, the 130 by the Japanese and the 85 lost by the Italians.

The final score sheet, as verified by Japanese records, disclosed that the submarines accounted for 54.7% of the Japanese merchantmen and 29% of the men-of-war sunk by all agencies, and this by a force which comprised but 1.6% of the total personnel of the United States navy! Impressive as these figures were they did not tell the complete story. The sinking of enemy ships, while the most important, was but one of the many phases of the submarine war. The war in the Pacific offered many unusual opportunities for the employment of submarines and, for the first time in history, they were exploited to the full extent of their capabilities. Many were the tasks assigned which had never been envisioned in prewar planning and training. The ability of the submarine to enter and remain undetected in enemy waters gave it a flexibility of movement denied to other types, and the fleet and force commanders were quick to capitalize on that ability. Evacuation of personnel from enemy-held territory, running ammunition and food into Corregidor and gasoline into Guadalcanal, supplying of guerrillas in the Philippines, landing of marine and army raiders on enemy islands, photographic reconnaissance of enemy beaches prior to amphibious landings, rescue of aviation personnel shot down over enemy waters, gun and rocket bombardments of enemy shore installations, supplying weather information for carrier strikes-these and a host of other tasks were successfully undertaken by the undersea craft. One of these extra-curricular tasks, that of air-sea rescue of aviators, assumed such major proportions that at war's end, with Japanese ships scarce and hard to find, it was absorbing almost 50% of the entire submarine effort. The story of its modest birth and rapid growth are worthy of this

Lifeguarding.—During the summer of 1943, ships, personnel and equipment were being assembled in the Pacific

for the offensive which was to start with the Gilberts campaign in November. In August a number of new carriers, with their supporting cruisers and destroyers, were formed into task force 15, under Rear Admiral Charles A. Pownall, to conduct a series of hit-and-run raids on various Japanese islands, with the dual purpose of harassing the Japs and training the air crews. For each of these raids, Admiral Pownall requested that a submarine be stationed near the island target for the purpose of rescuing downed aviators. The first two of these air strikes on which submarines were employed, at Marcus island and at Tarawa on Sept. 1 and 20, respectively, offered no opportunities for rescues but they did prove the feasibility of the plan. The highly successful submarine air-sea rescue work, or "lifeguarding" as it came to be called, was the outcome.

The first successful lifeguard mission was that performed by "Skate," who succeeded in rescuing six aviators during and following the carrier strike on Wake island on Oct. 6 and 7, 1943. These rescues, made under most trying conditions in the face of Jap gunfire, met with general acclaim from the carriers and carrier pilots. The submarines were definitely in the lifeguard business for the remainder of the war. Thereafter, no important air strike was ever made without its submarine lifeguards. During the seven and one-half months of hostilities in 1945, submarines spent 2,739 patrol days on lifeguard station, with as many as 20 submarines on such stations simultaneously around the Japanese empire during the closing months of

Altogether, a total of 504 rescues were accomplished by 86 individual submarines. "Tigrone" led with 31, followed by "Tang" with 22, while 17 submarines rescued 10 or more aviators each. In making these rescues, the submarines were catholic in their tastes-army bomber and fighter crews, marine corps fighter pilots, British and U.S. carrier pilots, with a few Japanese airmen, not included in the totals, salvaged for good measure.

Some rescues were purely by accident. A submarine heading for its station, or patrolling its area would occasionally encounter an aviator who had been adrift for days and who had long been given up for lost. On June 7, 1945, "Trutta," en route to its area, rescued an army pilot who had been drifting for six days and who had ridden out a typhoon in his one-man rubber lifeboat. More remarkable still, "Sealion II," on April 2, 1945, while passing through the South China sea, picked up an army bomber crewman who had been adrift in his rubber boat for 23 days, and who, aside from the loss of 40 pounds, was none the worse for his experiences. A few of the rescues were the result of long and thorough searches of a general area where planes were known to be down. But most rescues were the direct result of extensive planning and training which brought about effective co-operation between submarines and planes. For carrier strikes, one or two submarines would be stationed in the vicinity of the island target whereas for the B-29 attacks on the Japanese mainland, three or four would be stationed along the approach and retirement routes. The plane crews would be briefed on the location of these lifeguards, and planes in trouble would head for the submarine and ditch in its vicinity or would send a ditching message which the submarine would intercept and head for the position to start its search.

Many of the rescues were routine in nature; others were accomplished with the exercise of outstanding resourcefulness and daring. Perhaps leading the field in both of these attributes was the rescue on April 1, 1944,

of a carrier pilot who had landed on the reefs of the Japanese air base at Woleai in the Caroline Islands. The story is best told in the words of the official report of the commanding officer:

[8:25 A.M.] Planes sighted, headed for Woleai. Contacted aircraft by voice and learned of 'Downed Pilot'

drifting toward the reefs. o840 Made full speed on four engines. From here on, the picture in the skies looked like a gigantic "Cleveland Air Show." With dozens of fighters forming a comfortable umbrella above us, we watched a show that made the Hollywood "colossals" seem tame. We rounded the southeast coast of Wolcai one to two miles off the beach and had the perfect "ringside seat." The plastering that the airmen gave this Jap base was terrifie! Boinbs of all sizes rained on every structure on the island. Several buildings seemed to be lifted and thrown high in the air. Causeways between the various islands were bombed. Oil or gasoline storage tanks blew up covering the islands with heavy clouds of black smoke. The runway on the island was hit time and again with large and small bombs. It was hard to believe that anything could be left on the islands after the first waves of planes had gone over, and yet some bursts of AA, fire continued to meet the planes on each attack. The bombers hit Woleai from the south, waited for the smoke to clear, reformed, and then gave it the works from east-west courses! Fighters seemed to hit the place from all directions, peeling off from high above and diving straight into the AA, fire that still persisted. Many looked as if they would go right on through the blanket of smoke and crash on the islands, but all managed to pull out just above the trees. Fires blazed intermittently on Woleai and most of its adjacent islands and gradually the AA. defense was reduced to a few sporadic bursts.

Fighters now zoomed the "Harder" one mile off the northeast corner of Woleai and guided us toward the downed pilot.

He was finally sighted on the northwest tip of the second island to the west of Woleai. Battle surface stations were manned, the ship flooded down, and maneuvered into a spot about 1,500 yards off the beach. White water was breaking over the shoals only 20 yards in front of the ship and the fathometer had ceased to record. Planes now advised us that if rescue looked too difficult from here (and it did) that a better approach might be made from another direction. Backed off to make approach from another

angle. The aviator had been standing on the beach and was now observed to fall and lie there outstretched on the sand. His collapse was undoubtedly due to physical exhaustion, but also to the disappointment in seeing his chances of rescue fade away. We were then advised by the plane that further air reconnaissance showed the first approach best after all. Reversed course and headed back at full speed. Made ready the rubber boat (no paddles were aboard), selected Lieutenant Sam Logan. "J" "W" Thomason, SC1c, and Francis X. Ryan, MoMM1c, from a large group of volunteers and maneuvered the ship in for a second attempt at rescue. Moved in again until the forward torpedo room reported, "Bottom scraping forward" (soundings at zero fathom) and worked both

screws to keep the bow against the reef while prevent-

ing the ship from getting broadside to the waves. The three volunteers dove over the side and com-menced pushing and towing their rubber boat toward the beach about 1200 yards away. A line was played out from the sub to the rubber raft in order to pull it back from the beach. Meanwhile, one of the planes had dropped another rubber boat to the stranded aviator who got in and commenced feebly paddling it to sea against the tide. When the rescue party reached a spot where they could stand up, Thomason was directed to remain with the rubber boat while Lieut. Logan and Ryan waded on through the surf toward the aviator. Both were in the breakers now most of the time and their feet and legs were badly cut by the coral reefs. After about half an hour, Logan and Ryan, alternately swimming and wading, reached the aviator whose raft had meanwhile drifted farther

twily by this time he wis thoroughly exhiusted. They put him in the rift and by differently pushing and swimming heided back toward their jubber boat from which a line led to the submanne about 300 yards. Meanwhile a float plane (also attempting the rescue) taxled over the line to the raft and it parted?—The entire rescue party was now stranded. Thomas son was then recalled and managed to swim back to the sub after a hard battle against the tide. Another volunteer swimmer Freemin Paquet Ji. GMic then dove over the side and finally managed to swim a line to the three men standing just inshore of the heavy breafers. This line was made first to the raft and little by hittle the four men were pulled through the breakers and brought back to the ship.

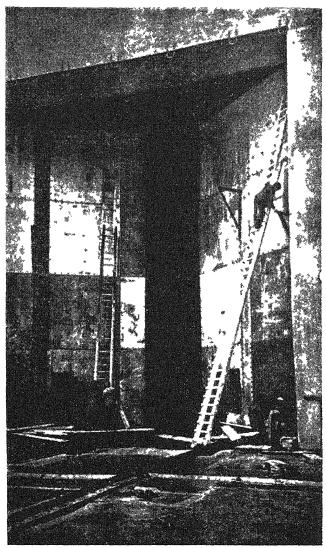

Throughout the entire reacted the cooperation of the evictors was superb. They kept up a continuous pounding of the islands by bombs and flew in low to Strife the Jips and divert then attention from the rescue. In spite of this Jip snipers conceiled in the trees along the beach commenced shooting at the ship and rescue party and bullets whined over the budge uncomfortably close. The rescue could never have been attempted without ne protection ifforded by the Hines Too much priise cumot be given to the offi cers and three men who effected this rescue. Its daring execution under the noses of the Jips and subject to super fire from the beach can be dissified as a truly couragious accomplishment and the rescued avaitor— (Insign John R. Galvin)—though physically exhausted showed a character that refused to admit defeat. It is a privilege to serve with men such as these

This account has been written in considerable detail partly to portray the spectacular in smashing of a Jap base, and partly in sheer pride of the volunteers who carried out the rescue

Commander S D Dealey who commanded Harder" and who wrote the above report was outstanding in every thing he undertook. On the same patrol in which this rescue was made he sank one. Japanese destroyer and damaged another. On his next patrol he cained the congressional medal of honour for the unbelievable performance of sinking five. Japaneses within the space of a lew days. Commander Dealey did not live to receive this highest of all awards. Harder, was lost with all hands on the following patrol while attempting to add another destroyer to its long list of victims.

Vying with 'Harder's' rescue in resourcefulness was the rescue on June 13 1944, of a carrier pilot just two miles off the coast of Guam when that island was still in Japhands. While approaching this aviator 'Stingray,' commanded by Commander S. C. Loomis. Jr. was forced to dive by fire from shore batterics. With shells dropping ill around the periscope. Stingray' continued in and liter three unsuccessful attempts lasting almost four hours, succeeded in having the downed pilot grab hold of the periscope, to be towed out of range of the shore batteries and then taken aboard.

In addition to the lives saved, submarine lifequarding exerted an influence on air force morale which had far leaching effects on the progress of the war. Pilots flying their fighters or bombers hundreds of miles from their bases or carriers became more aggressive in their attacks when they realized that even were their planes shot down in Jap waters they had an excellent chance for rescue. As the curve of successful rescues rose, the confidence of the fliers in the ability of the submarines to bring them home rose with it. This confidence reached its climax during the closing days of the war, when a carrier pilot remained off the coast of Japan guarding his downed wing man until he himself ran out of gas and had to ditch. Rescued by "Whale" and asked to explain why he hadn't tried to get back to his ship he stated that he wasn't wor

'Submarine fortress constructed by the Germans on the Atlantic coast of France to shelter U boats in port from aerial attack. This photograph was smuggled out of German occupied France in 1942

ried, he knew there would be a submarine along to pick him up

Lifeguarding profited the rescuers as well as the rescued Submarines had been the lone wolves of the U.S. navy I hen movements were cloaked in silence, they patiolled enemy waters denied to the surface forces. They stalked and struck and hid—a sinister arm fighting a sinister type of warfare. But with each successful rescue the submarine force and its methods became less and less a mystery to other units. By the time the war ended submarines had attained their rightful status among the honoured branches of the armed services.

British Submarine Operations

The importance of the submarine as an offensive weapon in naval warfare was brought home to the British just seven weeks after the outbreak of World War I On Sept 22, 1914, the first of the German U boat aces, Wed digen, in his U 9, sank the British cruisers 'Hogue "Aboukir" and 'Cressy," with a loss of more than 1 100 lives The action took place in the English channel with all three ships sinking in little more than an hour after the first attack. The 10yal navy had had a sizable submatine fleet in commission at the time—78 as compared with

30 for the Germans—but up until this action occurred the submarine had been looked upon as a defensive weapon for coastal patrol work and little had been done to develop its offensive capabilities, or to counter the submarine when employed offensively by the enemy. Even prior to these sinkings the potential strength of the submarine had been indicated when on Sept. 5, the light cruiser "Pathfinder" went down from U-boat attack, to be avenged a week later by the sinking of the German cruiser "Hela" off Heligoland by E-9, commanded by Lieutenant Commander Max Horton. These victories of the submarine over surface vessels augured ill for the traditional supremacy of the British fleet, and the attitude of the admiralty concerning submarines changed from complacency to grave concern. Every effort was expended toward the development of antisubmarine weapons and methods.

The activities of the German submarines during World War I and how close they took Germany to final victory, are too well known to be recorded herein. The lesson learned was not to be forgotten, and in the years between the wars the British, through diplomatic means, endeavoured to outlaw the submarine as a weapon of war. In addition, in the early 1930s, the British perfected the Asdic -an echo-ranging, underwater sounding equipment for the location of submerged objects-for use on destroyers and on other antisubmarine craft. Following this development, the admiralty's attitude toward the seriousness of the submarine threat again changed; the royal navy then felt that it could successfully put down any submarine menace that might threaten, and with this confidence came a more conservative attitude toward their own submarine branch.

In the peace years, the royal navy maintained a modest submarine fleet. Small groups were stationed with the far eastern fleet, in the Mediterranean and in home waters. In Sept. 1939, there were 60 submarines ready for service. Most of these were of the "H" and "L" classes, launched during 1918–19, of limited capabilities. However, 11 were under construction and a 12th, "Thetis," which had foundered during its trials off Liverpool in June, was being salvaged, to be renamed "Thunderbolt."

Upon the outbreak of war in Europe, the British recalled their submarines from the far east for duty in home waters. Since France, her ally, possessed a very large submarine fleet, an agreement was made that French submarines would conduct the patrols in the Mediterranean. The British submarines would patrol the North sea and the Bay of Biscay.

The operating theatres of action for the British submarines in World War II shifted with the progress of the war. In the beginning, the channel and the home waters were patrolled. Then, in 1940, came the Norwegian campaign with the invasion of Norway—this opened up the Norwegian coast, the fjords of the Kattegat and the Skagerrak. After the fall of France, the patrols of the Mediterranean and the French coastal position became the royal navy's responsibility. And, finally, during the summer of 1944, British submarines joined in force the U.S. submarines operating in far eastern waters against the Japanese.

The day Germany invaded Norway, "Truant" torpedoed and sank the German cruiser "Karlsruhe" off the Norwegian coast. Following this initial success, British submarines maintained a close-in offensive in the Norwegian waters against the German transport and supply ships supporting the invasion forces and succeeded in sinking 90,000 tons of German invasion shipping during the month of

April 1940. A notable event of this campaign was the sinking of the "Rio de Janeiro," a 5,000-ton German troop transport by the Polish submarine "Orzel." "Orzel" had escaped from axis custody in the Baltic and after a very dangerous voyage without compass or charts had made its way to the English coast and joined up as an operating unit of the royal navy.

With the fall of France in June 1940, Germany became an Atlantic power and made haste to use the many strategical advantages which possession of the French coast brought her. At Lorient, St. Nazaire and other French coastal ports, U-boat pens were built. The U-boats commenced to operate in force from these bases against the Allies' Atlantic life line.

The British shifted their submarine offensive at this time to the Bay of Biscay, the channel coast of France and the Mediterranean. Patrols in the channel were very hazardous because of the danger of mines, the shallow water, and the ever-present danger of attack from nearby land-based axis aircraft. In these areas, the submarines sought as their main targets the U-boats entering and leaving their coastal bases, the German blockade runners, and the small coastal convoys which the Germans attempted to operate along the French and Dutch coasts.

A keen disappointment to the royal submarines occurred when the German battleships "Scharnhorst" and "Gneisenau" successfully eluded a large group of submarines patrolling off Brest, France, in late March of 1941. Although aircraft reconnaissance had furnished good intelligence and the submarine deployment seemed sure to make contact should the "Scharnhorst" and "Gneisenau" sortie, the operation came to naught. The German ships escaped from Brest at night and, aided by rough seas and loggy weather, avoided the deployed submarines, passing through the English channel and into the North sea without damage.

Italy entered the war on June 10, 1940, on the side of the axis powers, and the Mediterranean with its contiguous waters—the Tyrrhenian, Ionian, Adriatic and Aegean seas—became the principal theatre of naval war. British submarines operated in this area for three years while the opposing armies waged the land war along the coast and over the deserts of North Africa.

In the initial stages of the campaign in the Mediterranean, the British had only a very meagre force of submarines available. Operations in the Mediterranean were difficult because of the transparent water, the coastal shallows and the frequent calms that prevailed. In such waters, the large type submarine was unsuitable for offensive work. Three of the first four large submarines that went out from Malta after Italy's entry into the war were lost.

As the war in the Mediterranean progressed, the British submarine strength increased despite losses suffered in offensive operations. New submarines of the U-class arrived and operated from Malta. These small submarines, although lacking both speed and endurance, were particularly suited for patrolling narrow waters. They concentrated on the Italian shipping routes between Tripoli and the Sicilian ports; the larger submarines operated in the eastern Mediterranean and in the Adriatic.

The advance of British land forces beyond Bengasi in Feb. 1941, marked the beginning of the first Allied major campaign in North Africa. In support of the campaign, British submarines set out to interrupt the axis convoy traffic to Libya. By the end of February, when the rout of the Italian army ended at El Agheila in the Gulf of Sirte, British submarines in the Mediterranean had sunk 100,000 tons of axis shipping.

As the land war in the Mediterranean theatre shifted back and forth from 1941 to 1943, the missions of submarines continued with additional tasks being imposed to meet the ever-changing situations. In the evacuation of Crete, H.M.S. "Thrasher" embarked 68 Allied personnel and transported them safely to Alexandria, Egypt. The larger type submarines, especially minelayers, were used in the vital service of supply to the beleaguered island of Malta. The axis powers had won control of the air over the island and had almost choked off all means of bringing in supplies by surface ships. To the submarines fell this mission of supply, and submarines operating as underwater freighters and passenger ships sailed from Gibraltar and Alexandria.

Throughout the long siege of Malta, British submarines continued to operate from the little battle-scarred island. Underground workshops and storage vaults were constructed, and safe living quarters were provided for the submarine crews resting between patrols. When the bombing became too intense, submarines in port for repairs were taken a short distance to sea, submerged, and work was continued while lying on the bottom. The spirit displayed by the British submarine personnel and their supporting forces at Malta in the face of such hardships was noteworthy and contributed much to the eventual success of the Allied naval forces in the Mediterranean theatre. As the Germans made greater efforts to supply and reinforce Gen. Erwin Rommel's troops in North Africa, the tonnage score of the British submarines rose. From February to mid-November 1941, the axis lost 300,ooo tons of supply shipping to submarine attacks. Among this tonnage were five of the largest Italian liners which the axis powers were using in a desperate effort to reinforce their armies in North Africa. The importance of these sinkings was heightened by the fact that they were southbound and full of troops and war material when sunk. Such sinkings put a great strain on the German air force, which was then compelled to use large numbers of aircraft for transport and supply missions.

The policy of the Italians throughout the war in the Mediterranean was to take no undue risks with their fleet. When they did put to sea, they were generally very closely and heavily screened. For these reasons, there were few real opportunities for the British submarines to make attacks against heavy combatant ships. However, those occasions which were afforded were fully exploited. In a night surface attack, "Utmost" sank an Italian cruiser in Nov. 1941, and in 1942, the cruisers "Giovanni delle Bande Nere" and "Armando Diaz" were sunk by "Urge" and "Upright" respectively. By such sinkings, the "Unity" class submarine proved its deadly offensive power in shallow water operations.

As the land war in Africa gradually turned in favour of the Allied armies in late 1942 and early 1943, the axis powers, in an endeavour to stave off defeat, used every means to reinforce the Afrika korps and to maintain a foothold in North Africa. Although the Germans made wide use of air transport for supplies and troops, they still had to rely on ships to carry bulk supplies across the Mediterranean. The axis convoys were almost always under the protection of German land-based aircraft-either from Sicily or Tunisia. To the royal navy's submarines fell the greater share of the burden of disrupting this reinforcement traffic. An example of the effectiveness of the British submarines against this convoy traffic was the record of H.M.S. 'Splendid." In the closing months of the African war, "Splendid" sank three tankers, six supply ships, two destroyers and three antisubmarine vessels.

When the Italian fleet surrendered on Sept. 11, 1943, the Mediterranean campaign ended. Between the entry of Italy into the war and the surrender of its fleet, British submarines sank 1,335,000 tons of axis shipping in the Mediterranean. The submarines' contribution to victory was not without its cost; 41 British submarines were lost in that theatre of action during the campaign.

Although the Mediterranean theatre occupied the major share of the British submarine effort during the campaign in North Africa, some submarines did operate in the Arctic during the same period, maintaining patrols between the North Cape and Varanger fjord. The mission of the patrols was to attack German shipping bound for Kirkenes, Norway, or Petsamo, Finland, with supplies and reinforcements for the German and Finnish troops on the north Russian front. A secondary mission was to help divert attention from the passage of British convoys to Murmansk and Archangel, U.S.S.R. In these Arctic patrols, the British submarines operated in co-ordination with Russian submarines and were based at Polyarni, near the mouth of Kola inlet, at the head of which lies Murmansk. Never before had submarines of the royal navy operated under such arduous conditions. Material difficulties and personnel hardships were numerous and ever-present. However, despite great handicaps, the patrols were maintained; several heavily-laden German supply ships were sunk.

The damaging of the German battleship "Tirpitz" by British X-craft in Oct. 1943, announced to the world the British use of midget submarines. Built in 1942–43, the X-class of submarine was about 50 feet in length and had a crew of four. The cruising range of the X-craft was very limited, less than 100 miles. It was designed to be towed to the vicinity of the scene of action.

Near the end of the war in the Pacific, X-craft entered Singapore to attack the damaged Japanese heavy cruisers "Myoko" and "Takao."

The royal navy also developed a human torpedo for use during World War II. This torpedo, operated by a crew of two, was designed to permit attacks on anchored targets. On an attack it manoeuvred at slow speed toward its target and then submerged. The nose charge was fixed to the enemy hull and the crew escaped on the torpedo body, the charge being detonated some time later by the action of a time fuse. These torpedoes were used successfully in attacks against the strongly defended base at Palermo, Sicily. There on Jan. 3, 1943, they sank the Italian cruiser "Ulpio Traino" and damaged a transport. Later, in June 1944, they sank the German-manned Italian cruiser "Bolzano" in the harbour of Spezia, Italy.

During the last year of the war, British submarines operated with their U.S. colleagues in the war against Japan from bases in southwest Australia. They were formed, with the U.S. submarines, into one force under the operational control of Commander Submarines Southwest Pacific.

The story of the U.S. submarines during this period was also the story of the British.

During World War II, British submarines sank 2,000,000 tons and damaged approximately an additional 1,000,000 tons of axis naval ships and merchant shipping. Seventy-two British submarines were lost. The royal navy could well be proud of its tough, hard-hitting submarine service.

Japanese Submarine Operations

At the time of Pearl Harbor, the Japanese navy pos-

sessed a modern submarine fleet. Numerically, Japan had the largest force of cruiser-type submarines in commission. It began building up its submarine fleet after World War I, using as prototypes the surrendered German submarines that had been allotted to it by the terms of the peace treaty. The Japanese considered themselves naturally adapted as a race to submarine warfare and devoted much interest and effort to development of submarine designs in the pre-World War II years.

Between 1920 and 1940, various submarine types were designed and built for experimental and operational purposes. Of these, the long-range reconnaissance type and the midget submarines were perhaps the most noteworths. The long-range reconnaissance type was a large submarine of about 2,000 tons surface displacement, equipped with a float plane and having a fairly high surface speed, about 22 knots. The midget submarine had been fairly well developed prior to the outbreak of hostilities, while during World War II the Japanese developed and built the very large 1-400 class reconnaissance and cargo submarine. This type was designed primarily for the transportation of supplies, fuel and planes to the beleaguered outlying Japanese island garrisons. An appreciation of the unusual size of this type can be had from the following tabular comparison of the I-400 class with a standard U.S. fleet submarine, which was considered a large type:

| Length over-all | Length over-all | 1-400 | U.S. fleet Submarine | 100 feet | 310 feet | 1,000 fors | 1,000 fors | 21 officers | 8 officers | 171 men | 72 men |

The I-400 class was fitted with eight-bow torpedo tubes and could carry four planes. To launch and recover the aircraft, a catapult and a portable aeroplane crane were installed.

Japanese submarines, except for the midget class, were not designed for mass production. As the war progressed, Japanese building facilities could not keep up with submarine losses and, consequently, the number of submarines available gradually diminished. However, the midget class was readily mass-produced and the war's end found hundreds of midget submarines in production and ready for operational use to defend the Japanese home islands against invasion.

The Japanese conception of the strategic use of the submarine arm was principally as an adjunct to their surface fleets. The submarine was used extensively for scouting and reconnaissance in advance of their surface units. Submarine reconnaissance of an objective area was always made preliminary to an amphibious assault or invasion. Offensively, the Japanese expected to employ their submarines in strength in ambush lines—that is, they were to be deployed across an enemy major fleet's track to attack and re-attack the enemy's large combatant surface units. It was for this reason and not because of any humanitarian motives that Japanese naval policy placed little stress on the submarine's role in commerce destruction. The submarine arm was integrated into the various fleets of the navy, and there was no central operational command for the submarine effort nor any over-all plan for the efficient employment of submarines.

The navy was hampered in its submarine combat operations by serious interference from the Japanese army, which was able to force the navy to use a large portion of its available submarines for transport and supply duties. Coupled with this interference, the Japanese navy, after the first year of war, began to feel the serious shortage of

scientific and technological knowledge. As compared with the Allied nations, little real progress was made in the development, production, and installation of radar, sonar radio and fire control equipment. The Japanese were cognizant of these deficiencies very early and, as a result planned their submarine operations with marked caution in an effort to minimize losses. The navy plan was to "save" the submarines for use against the U.S. fleet by restricting targets to the more valuable combatant ships. This encouraged in the submarine commanding officers an extreme sense of caution that amounted almost to timidity.

Three submarines accompanied the Japanese carrier task force which attacked Pearl Harbor on Dec. 7, 1911 Other submarines had left Japan earlier and conducted patrol and reconnaissance in the vicinity of the prin cipal Hawaiian Islands to keep a close observation of the movements of the large number of U.S. fleet units pres ent in the islands. Of the submarines directly participating in the Pearl Harbor attack, some were loaded with midget submarines. Two of the midgets made a successful penetration of the Pearl Harbor estuary and claimed the sinking of one battleship of the "Oklahoma" class. Shortly after Pearl Harbor, in the southern Pacific areas, Japanese submarines were assigned reconnaissance and mining mis sions in the Philippine and Singapore areas. It was a Japa nese submarine that initially located the British capital ships "Prince of Wales" and "Repulse" and supplied the intelligence which enabled the Japanese to attack with tor pedo planes and sink these two valuable ships in the wa ters north of Singapore.

Prior to the battle of Midway, the Japanese submarines were assigned reconnaissance missions in the vicinity of Midway and Pearl Harbor. To co-operate in the Midway offensive, the Japanese deployed three submarines on a scouting line to the north of their main body. In the Midway action, on June 7, 1942, the I-168 sank the crip pled U.S. aircraft carrier "Yorktown."

In the Indian ocean, the Japanese waged unrestricted submarine warfare on Allied convoys in a limited fashion. At no time did they have more than a squadron (about ten submarines) available for such duty. The Germans assigned a small group of their long-range, large 1,200-ton U-boats to operate in loose co-ordination with the Japanese in this theatre. The Germans established a liaison group with the Japanese for their submarines at Penang, Batavia and Singapore. The Japanese high naval command in the Southwest Pacific area had orders from Tokyo to co-operate with the German submarines in the matter of supply and maintenance, but had nothing to do with the operational control of the U-boats. Japanese submarines sank about 70 merchant vessels in the Indian ocean areas during the period of their employment in offensive patrols against Allied commerce.

Thirteen Japanese submarines co-operated in the invasion of the Aleutians in June 1942. In May 1943, when the United States torces attacked at Attu and later at Kiska, the Japanese position became untenable. Not desiring to risk surface transports, the Japanese employed 15 submarines to evacuate the Kiska garrison of 700 men to Paramoshiri

During 1944 and 1945, more than one-third of the available submarines were employed in transport and supply to the various isolated island bases, while German U-boats cooperated with the Japanese in blockade-running between Germany and the far east. Rubber and tin were carried to Germany and, in return, the Germans shipped plans of new weapons, optical supplies, and a variety of precision machine tools. This mission was a hazardous one; about

The United States fleet suffered a serious loss on Sept. 15, 1942, when the aircraft carrier "Wasp" was sunk southeast of the Solomons Islands by I-19. Other notable successes of Japanese submarines were the sinking of the escort carrier "Liscombe Bay" during the Gilberts campaign, and that of the heavy cruiser "Indianapolis" by the I-58 on July 29, 1945, northeast of Leyte, P.I.

In comparison with their modest successes, the Japanese lost 130 submarines during the war. The reasons for their over-all ineffectiveness were several—lack of building materials, backwardness of scientific research and efficiency of Allied antisubmarine measures all contributed. But perhaps the most important cause of the failure lay in the mistaken strategy of their employment by the Japanese high command. There was lacking a unity of purpose, an over-all war plan for the integrated employment of a large submarine force. When the navy became embroiled in the war, it shunted its submarine forces here and there—subordinating them to the service of the Japanese army and avoiding too-close contact with the enemy for fear of losses.

The intrinsic military value of the submarine as a powerful weapon of opportunity, of surprise in offensive warfare, was never fully appreciated by the Japanese.

The Submarine and the Future

Of what use would the submarine be in future wars? Did the Allies develop their antisubmarine measures to a point where the submarine ceased to be a menace? Had the atomic age made the submarine, as well as all the other conventional naval types, obsolete? To these questions, only qualified answers could be made at the end of the eventful decade 1937–46.

However, it could be said positively that research and development would greatly influence the employment of submarines

The Allies defeated the U-boat campaign in the Atlantic. However, had World War II continued and the Germans been able to place their new type high-speed, long-submerged endurance submarines into combat service, the issue might have been different. In addition to this interim type, the Germans sought to build a true submarine—one capable of remaining submerged indefinitely, possessing high submerged speed, and able to operate at great depths. It became known later that the Germans had working prototype models of a true submarine and apparently would have been able to develop the type in a short time. Whether Allied antisubmarine measures would have been able to cope with these new type U-boats remained problematical.

The atom bombs of Hiroshima and Nagasaki ushered in the atomic age of warfare. Press reports of the first and second Bikini atom bomb tests against modern naval ships left little doubt that revolutionary changes were in the offing in the design of warships to suit the requirements of atomic warfare.

It was significant that the naval type which best withstood these tests was the submarine.

It was probable that the atomic age of warfare would bring about the dispersal of great cities and industrial centres. It might force radical changes in naval tactics—the elimination of the concepts of large, surface task forces made up of battleships, carriers, cruisers and the many light and supporting forces. It might well be that the submarine would emerge as the only practical naval type able to navigate and hold the command of the seas of the world against an enemy power possessing atomic weapons.

It had been said that the future would belong to those weapons capable of operating in a medium of three dimensions—the submarine and the aeroplane. Who could say that huge atomic-powered submarines built as aircraft carriers, as battleships, or as amphibious assault ships might not rise from the ocean depths to decide the issue should a World War III engulf the world?

Suez Canal

The prominence of the Suez canal during the years 1937-46 was the immediate outcome of the events of 1935 and 1936. Italy, having conquered Ethiopia, effected a junction between its Red sea colonies of Eritrea and Italian Somaliland. The possession of Libya had already given Italy a frontier with Egypt on the east, and by the further enlargement of its African empire, as well as by the requirements of the Ethiopian expedition, the Suez canal had assumed a new significance for Italy. The campaign had necessitated the employment of the canal for the transit of war material and when the League of Nations had imposed sanctions under Article 16 of the covenant the closing of the canal to Italian shipping had been considered. The view had prevailed, however, that such action would be contrary to the stipulations of the Suez Canal convention of 1888. Nevertheless, Italy regarded the possibility of such a closure as a potential threat to its communications, and as making it a virtual prisoner in the Mediterranean, dependent on the goodwill of Britain, although by an agreement of April 16, 1938, both Britain and Italy reaffirmed their intention to respect the terms of the convention.

From 1937 to 1939 Italy sought to secure a more favourable position in regard to the canal by activities designed to weaken Britain's relations with Egypt, and by pressing claims to representation on the board of the Suez Canal company on the ground that it was now the second largest user of the canal. These claims were resisted by the company and were resented by Egypt. The canal was in Egypt's territory and would revert to its control at the expiration in 1968 of the concession granted to the company. The defense of the canal had been a joint Anglo-

Egyptian concern since Britain had taken the place of Turkey under the Suez Canal convention by the terms of the peace treaties after World War I and any changes required the consent of both powers. By the Anglo-Egyptian treaty of 1936, full recognition had been given to Egypt's right of self-defense as an independent sovereign state, and Britain had agreed to withdraw its forces to the canal zone when preparations for their reception were completed. Unable to attain its objectives, Italy proceeded to augment its fleet and military installations in Libya, and in April 1939 it became necessary for Pres. Franklin D. Roosevelt to invite an assurance from Germany and Italy that no aggressive intentions were designed against certain countries, including Egypt.

With the outbreak of World War II, and especially the collapse of France in 1940, Italy seized its opportunity. Not only was Britain fully engaged at home, but also the wings of the defensive system covering the Suez canal had folded up through the impotence of France in Tunisia and Syria and the neutralization of the French Mediterranean fleet. Late in 1940, Egypt was invaded from Libya, but the Italian forces halted immediately east of Sidi Barrani, and the British counterstroke in December forced their withdrawal to the back of Cyrenaica. Germany intervened in North Africa in 1941 and by June 1942 the axis troops were again on Egyptian soil and pressing forward to the Nile delta and the Suez canal. This time they were stopped at El Alamein, two days' march west of Alexandria. There a decisive battle was fought at the end of October and with the British victory the land threat to the Suez canal was ended. The danger to the canal from air attack and minelaying continued, however, until the Allied victory in Tunisia (April-May 1943) and Italy's subsequent surrender. From then on, the full use of the canal became possible again, thus affording help to Burma and facilitating preparations for the campaign against Japan.

In 1945–46, the defense of the canal was under review in negotiations between Britain and Egypt. The withdrawal of British forces to southern Palestine would still permit common defense of the canal even if British garrisons were not to remain in the canal zone. Developments in international affairs in any case required a Iresh instrument to replace the Suez Canal convention of 1888.

During 1937-46, the board of the Suez Canal company consisted of 32 directors (19 French, 10 British, 2 Egyptian, and 1 Dutch). Because of wartime conditions, however, there were in 1946, 4 vacancies (3 French and 1 British). After conversations between the canal company and the Egyptian government (1936-37) it was agreed that two of the directors should be Egyptian. The Egyptian government would also appoint a commissioner with right of inquiry into all the company's dealings. The company undertook to pay the government an annual rental of £E300,000 and to contribute the single payment of a like sum toward the cost of the strategic roads beside the canal provided for by the Anglo-Egyptian treaty. Other stipula-

tions covered the employment of Egyptian staff and the basis of valuation for the maximum chargeable for dues. In 1946 the tasks immediately ahead consisted mainly in making up arrears of maintenance and in carrying out local improvements held up by the war. New works were to include improvements in Port Said harbour. (H. J. SD.)

Sugar

World sugar production had increased slowly up to 1923, when the total passed 23,000,000 tons. From then until 1930 there was a relatively rapid increase to 31,800,000 tons, followed by a slight decline and then another increase to over 35,000,000 tons in 1936. Alter 1937 a new high record of 35,942,000 tons was set in 1940, followed by a steady decline to about 27,200,000 tons in the 1945-46 season—about 7,300,000 tons less than the prewar (1935–39) average. The losses were due to the reduction in cane sugar production in Java and the Philippines, and in bect sugar production in central Europe. In 1940, German-controlled areas reported production of over 3,000,000 tons of raw beet sugar, which had to be deducted from the world total in later years. Production fell off in other European countries; France, for instance, with a prewar (1935-39) average of over 1,000,000 tons, reported only 660,000 tons in 1943. The greater loss was in exportable surplus, which in 1945 was estimated to be almost 35% below the prewar average. Gross exports were estimated by the U.S. department of agriculture at 7,971,000 tons in 1945-46 compared with 12,603,000 tons prewar average 1935-39.

International control of sugar distribution was begun in 1937 under an agreement concluded between 21 countries, and ratified by the U.S. senate Dec. 20, 1937, to allot quotas for five years. The United States Sugar act of 1937 was passed to remedy the situation caused by the supreme court decision invalidating the processing-tax under the Jones-Costigan act of 1934 and the Agriculture Adjustment act. This act continued in force until it was suspended by executive order in 1942. The 1940 U.S. sugar production was maintained at a record level with a depressed market. South American exporting countries were cut off from European markets, and their stocks became available to the United States, resulting in the largest supply on record.

World sugar markets were divided by World War II into three major areas—Japanese-controlled Asia, German-con-

Gathering seed sugar cane in Louisiana for transport to new planting fields during the fall of 1945. Large crops were planted as sugar continued scarce in the United States

"Sugar Shortage," a reflection on the ironies of U.S. sugar rationing during World War II, by Goldberg of the New York Sun

trolled Europe and the United Nations areas. There was no trade among these areas; the United Nations remained dependent on the western hemisphere. Prior to the war, the hemisphere was a surplus area to the extent of about 1,300,000 tons, mostly shipped to Europe. At the beginning of 1945, sugar production accessible to the United Nations was estimated at about 20,400,000 tons of raw sugar, or 5% less than had been produced in the same area in the previous season. The year 1945 was expected to be the low point of both production and consumption. Early 1946 reports from all over the world indicated that recovery was taking place slowly. The rebuilding of sugar mills and transportation facilities in Europe had hardly begun in 1946.

The sugar situation was summarized by a committee investigation by the United States house of representatives in 1945 which said the causes of the sugar shortage were as follows: use of sugar, chiefly Cuban, for the making of alcohol to be used in synthetic rubber production; the drought in the Caribbean area; European relief needs; and heavy sugar consumption in the United States in 1944. The committee recommended continued rationing; purchase of the Cuban and Puerto Rican crops; a general review of allotments. The 1946 world production appeared to be increasing by the middle of the year, but stocks were very low so that the supplies for consumption were believed to be about the same as in 1945.

The production of sugar, cane and beet, in continental United States increased steadily up to 1937, when it reached a total of 1,720,000 tons. A decline then began, and the output dropped to 1,399,000 tons of raw sugar by 1943; but it increased to 1,760,000 tons in 1946. The U.S. supply, including that produced in the possessions, was estimated at 4,977,000 tons in 1937; it declined to 3,149,000 tons in 1943 and 3,618,000 tons in 1945. After 1941 the Philippine crop was not included. The United States supply was usually considered to include the surplus of

the Cuban crop. The total, including the Cuban supply, was 8,357,000 tons in 1937, 7,849,000 tons in 1943, and 8,068,000 tons by 1945. The shortage of sugar in the United States was the result of the several changes; reduced domestic production, loss of the Philippine supply, smaller shipments from Puerto Rico and smaller output of Cuba in some years.

Sugar beet acreage in the United States was 816,000 ac. in 1937, slightly below the average of the previous 10 years. The area increased to 1,048,000 ac. in 1942, then declined to 716,000 ac. in 1945 and increased to 865,000 ac. in 1946. The yield during the war years was near the average of 12 tons per ac. which returned a crop of 10,900,000 tons in 1946, compared with an average of 9,568,000 tons during 1935–44. The planted acreage in 1946 was estimated at 930,000 ac., an increase of 20% over 1945, as the result of a vigorous campaign to increase the crop. Abandonment was low, but the scarcity of labour caused harvesting troubles. The competition of other food crops which could be grown with machine work was a factor in holding beet acreage down during the war period.

Sugar beet production increased in the United States from 8,784,000 tons in 1937 to 12,292,000 tons in 1940, declined to 6,753,000 tons in 1944 and then increased again, to 10,916,000 tons in 1946. From these crops of beets the sugar output was 1,288,000 tons in 1937, 1,773,000 tons in 1940 and about 1,228,000 tons in 1945. Prices to beet growers advanced from \$5.27 per ton in 1937 to \$10.70 in 1944 and \$10.20 in 1946; these included price supports of \$2.02 per ton in government payments.

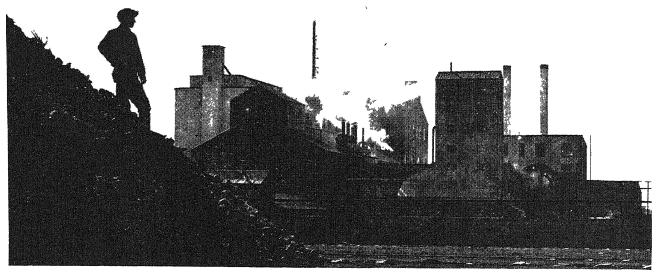

U.S. sugar cane production for sugar and seed continued at a stable level after 1937, the acreage for sugar ranging from 307,200 ac. in 1917 to a low of 269,700 ac. in 1940, then up to 298,800 ac. in 1946, as compared with an average of 291,210 ac. 1935–44. The later increases were almost wholly in Florida, under water control. The crop of cane for grinding ranged from 4,218,000 tons in 1940 to a top of 6,658,000 tons in 1946. Prices for the crop to farmers increased from \$2.90 per ton in 1937 to over \$5.00 per ton in 1946.

Under the U.S. Sugar act of 1937, the government made payments to beet and cane producers. From 1938 to 1941 the basic rate was 60 cents per 100 lb. of commercial raw sugar. Payments in 1942 and later years were at 80 cents per 100 lb., with reductions for growers producing 500 tons or more. Other payments were made for losses by abandonment, floods, drought, freeze or disease or insect damage. The total of these subsidies varied from \$46,000,000 to \$58,000,000 in different years. Other subsidies were paid to producers and processors for "excess" costs or as "incentive" payments to encourage the production of more sugar.

Sugar production in the United States possessions de-

Sugar beet refinery at Picture Butte, Alberta, Canada

clined as in the continental area. The Philippines produced about 1,150,000 tons from 1937 to 1940 inclusive, and thereafter none was available to the United States. In Puerto Rico over 1,000,000 tons was harvested in 1937 and the crop maintained nearly that average up to 1942. Hawaiian production, around 1,000,000 tons, dropped to 880,000 by 1944. The Virgin Islands crop amounted to an average of about only 4,000 tons after 1940. The Cuban crop, mostly bought by the United States during the war years, was 3,379,000 tons in 1937 and dropped to 2,734,000 tons in 1940 but recovered to 4,700,000 tons in 1943 and 4,450,000 tons in 1945.

Consumption of refined sugar in the United States was at a prewar average of 96.5 lb. per capita during the period 1935-39. The national supply included 1,948,000 tons from domestic production, 1,849,000 tons from the possessions, and 3,018,000 from foreign sources, mostly Cuban. Exports amounted to about 109,000 tons. By 1941, the supply had increased, because of larger crops and imports, to 11,166,000 tons; per capita domestic consumption was up to 103.6 lb. In 1942, military supplies and government purchases for export by lend-lease began by taking 608,000 tons. By 1944 these two requirements had increased to 1,330,000 tons, and the supply had shrunk to 9,209,000 tons, leaving only 89.0 lb. per capita for civilian consumption. By 1945, the per capita portion was down to 73.2 lb. and was estimated at 73 lb. for 1946. The United States had access to supplies adequate to increase production to normal levels, but the international controls held out supplies for countries dependent upon Java as a source since the Far Eastern stocks were not available. The United States government purchased the entire Cuban sugar and molasses crop, except that needed for Cuban consumption, from 1942 to 1946. The price in 1942 and 1943 was 2.65 cents per lb. for raw sugar, f.o.b.

U.S. sugar rationing began in May 1942, and was modified at frequent intervals as the war progressed. Special allowances were made for canning and preserving under the stamp system.

The use of sugar by institutions was controlled after April 1942, beginning with 50% of the amount used in the base period in 1941.

Allotments for industrial users of sugar were held to 70% of the amount used in 1941 for most of the war period.

The Combined Food board allocated the crop among the Allied Nations, including the Cuban crop. Molasses was also allotted to alcohol-making plants and other users. The Defense Supplies corporation purchased alcohol made in Cuba from molasses. The government also purchased the entire sugar crop of Puerto Rico during 1942–46. The crops of the Dominican Republic and Haiti likewise were bought in 1942 and 1943, but in 1944 and 1945 these crops were bought by the United Kingdom. Hawaiian sugar was not bought by the U.S. government but was handled by the sugar trade as in prewar years. Price ceilings for wholesale and retail sales were maintained without change from 1943 to 1945.

Raw imported sugar was 3.74 cents per lb. at New York city.

While U.S. domestic consumption of sugar was increased somewhat in 1945 and allotments to institutions and industrial users were relaxed, the short crop of beets in Europe made it necessary to increase allotments to liberated countries in 1945 over previous years. Supplies from the Philippines were expected to be small for several years, since the Japanese had changed the sugar areas into rice and cotton production and neglected the sugar plantations. Military needs for sugar declined in 1945 and the need for alcohol also decreased,

The United States sugar supplies changed little from 1937 to 1940, and ranged at about 6,700,000 tons. In 1941 the total supply jumped to 8,140,000 tons following a big crop of beets in the United States and a large Cuban crop. Then, in 1942, supplies dropped sharply to 5,675,000 tons, because of the smaller Cuban crop and the loss of the Philippine supply. To restore an abundant supply, the U.S. government encouraged the planting of beets and cane and planned to aid in the rehabilitation of the Philippine crop.

As European agriculture became stabilized, the need of sugar for that region would shrink; Europe produced most of its sugar supply in prewar years. Recovery would be slow, however, because of the destruction of sugar refining machinery in Central Europe.

Sugiyama, Gen

Sugiyama (1880–1945), Japanese army officer, was educated at the Imperial Military college. He was vice-chiel of the military general staff and chief of the military affairs department of the war office, 1923–25, and attended the Disarmament conference in Geneva, 1926–28.

He became vice-minister of the army in 1930 and director of the army's aviation headquarters in 1933. He was made a member of the Japanese Supreme War council in 1935, inspector general of the army the following year and was minister of war, 1937–38.

Appointed commander in chief of the Japanese forces in North China in 1938, he held this post through the year 1939. In 1940 he was made chief of the general staff. Gen. Hideki Tojo ousted Sugiyama from this post on Feb. 21, 1944, assuming it himself. On July 18, 1944, it was disclosed that Sugiyama had been made inspector general of army education. Also a member of the board of field marshals and admirals, Sugiyama returned to the government as war minister in the cabinet of Kuniaki Koiso but was not recalled after the resignation of the Koiso government in April 1945. He then became commander of the 1st Imperial army. Unnerved by the Japanese surrender, Sugiyama and his wife committed suicide Sept. 12, 1945, in their Tokyo home.

Suicide Statistics

Comparisons of mortality from suicide are commonly based upon the number of deaths from this cause per 100,000 of population. Thus, there were 13,231 deaths from suicide in the United States during 1944; the estimated midyear population, exclusive of the armed forces overseas, was 132,552,000, so that the suicide rate was 10.0 per 100,000. These suicides accounted for 0.9% of the deaths from all causes during 1944.

International Comparisons.—Before World War II, Austria had a higher death rate from suicide (38.1 per 100,000 in 1937) than any other country for which data are shown in Table I. Mortality from suicide was generally high among the countries of central Europe. For example, rates of more than 20 per 100,000 were found in Germany (28.6 per 100,000 in 1936), Czechoslovakia (27.5 in 1937), Hungary (32.0 in 1937) and Switzerland

(23.9 in 1937). Outside this area, the rates were ordinarily high in Denmark and Japan. On the other hand, they were very low in Eire, Northern Ireland, Spain (according to data for 1935) and Greece. Of the English-speaking countries, suicide rates in prewar years were generally lowest in Scotland and highest in the United States, while Australia, New Zealand and England and Wales were on about the same level.

Effect of War.—The previous experience of a decline in the death rate from suicide during wartime was duplicated in World War II. For example, the rate in the United States fell from 15.3 per 100,000 in 1938 to a little more than 14 in 1939 and 1940, and then to 12.9 in 1941, before U.S. participation in World War II. The subsequent years saw the rate drop rapidly to 10 per 100,000 in 1944. According to indications provided by the Metropolitan Life Insurance company, the death rate from suicide continued low during 1945 until the close of European hostilities in May. Beginning with that month, the monthly rates for the rest of 1945 continued at a higher level than for the year before. For the first quarter of 1946 the death rate from suicide was more than \(\frac{1}{2}\); higher than for the corresponding period of 1945.

The decline in the suicide death rate in the United States from the prewar period 1939-41 to the war years 1942-43 was studied in regard to sex and age, again using the experience of lives with industrial insurance (Statistical Bulletin of the Metropolitan Life Insurance Company, July 1944). It was found that among white males, the declines were greatest at the oldest ages, where the death rates from suicide are highest. Thus, at ages 55 to 74, the suicide death rate for white males was reduced by about one-third within the brief period of study; at ages 25 to 34 and 45 to 54 the reduction was by one-quarter, while at ages 35 to 44 it was by only one-eighth. The decline at ages 15 to 24 was by less than one-fifth. Among white females, on the other hand, the greatest improvement was at the youngest ages, amounting to about one-third at ages 15 to 24 and one-fifth at ages 25 to 34, the older ages showing minor gains. The marked declines among older men and young women were attributed, in large measure, to the more favourable economic conditions these groups were experiencing through their increased opportunities for work at satisfactory wages. The psychological effect of World War II upon the population, subordinating personal concerns to the general wellare of the country, was also considered to be a beneficial factor in the suicide situation. The postwar increase in suicide mortality was found to be more rapid among men than among women. Factors that may have contributed toward this rise were temporary unemployment while converting from war to peace production and, perhaps, the problems of readjusting to civilian life by men leaving the armed services.

The situation in the United States was undoubtedly duplicated, in substantial part, in other countries during World War II. For example, the death rate from suicide in Canada fell from 8.6 per 100,000 in 1939 to 6.1 in 1944. England and Wales, likewise, showed a marked improvement, from 12.1 in 1939 to 8.9 in 1944. In Scotland, the decline was less rapid, from 9.2 in 1939 to 8.1 in 1943.

Of the German-occupied countries with available data, Belgium, Denmark and Norway showed wartime reductions in suicide mortality, but the first two also showed an upward tendency in the later years. Thus, the rate for Denmark declined from 20.9 per 100,000 in 1937 to a low point of 17.2 in 1942, only to rise rapidly to a maximum of

22.2 in 1944. In Belgium, the suicide death rate rose from 10.4 per 100,000 in 1943 to 12.3 in 1944. It is likely that these late wartime rises in suicide mortality were also experienced by other overrun countries for which data were not available; this adverse situation was undoubtedly a reflection of the deteriorating economic and social conditions in the occupied countries as the war continued.

The only indication regarding the course of mortality from suicide in the axis countries during World War II was a report for large towns in Germany showing an increase of almost 20% in the deaths from this cause from 1939 to 1942.

In contrast to the wide fluctuations in the death rates from suicide in the countries engaged in World War II, the records for three neutrals with available data remained fairly stable. Thus, Eire had a low rate of 2.8 per 100,000 in 1942, practically identical with those for 1937 and 1939. The suicide rates for Switzerland hovered about a level of 24 per 100,000 from 1937 to 1943, and then moved still higher to a rate of 25.6 in 1944. In Sweden, the rate rose from 15.6 per 100,000 in 1937 to 17.1 in 1940, but fell to 14.3 in 1942.

Race, Sex, Age.—Death rates from suicide in the United States were much higher among males than among females, and also higher for white persons than for Negroes. In 1943, for example, white males had a suicide death rate of 16.4 per 100,000; white females, 5.9; Negro males, 4.8; Negro females, 1.3 (see Table II). When the wartime rates of 1943 are compared with the prewar rates of 1940, the Negro female population showed a more rapid improvement than the white female population, while males of both races showed the same improvement; the decreases amounted to 31% for Negro males, 38% for Negro females, 30% for white males, and 19% for white females.

Death rates from suicide according to age for the United States are shown in the upper tier of Table II. The rates rose rapidly with advance in age up to 65 years. Thus, in 1944, the rate at ages 15 to 24 was 4.3 per 100,000; this rose to 21.4 at ages 55 to 64, and then to 30.2 at ages 75 and over.

Means of Suicide.—In the United States, the most frequent means of suicide was by firearms or explosives. The proportion of suicides in which this means was used varied little from year to year after 1940; in 1944, it was 36.3% (see Table III). Next in frequency as a means of self-destruction was hanging or strangulation, used in 23.1% of the cases in 1944; the percentage using this medium increased rapidly during World War II. Third in rank was suicide by poison; the proportion using this means declined gradually after 1940, and, in 1944, accounted for 11.2% of the suicides. There was a sharp drop in the per-

centage using motor vehicle exhaust gas as a means of suicide, from 5.6% of the total in 1940 to 2.8% in 1944; the decreases were most rapid in the last three years of this period, while gas rationing was in effect. On the other hand, the proportion of suicides using illuminating gas rose gradually to 9.4% in 1944.

There were no significant changes from 1940 to 1944 in the percentages of suicides by drowning, by crushing, or by jumping from high places.

Table III.—Per Cent Distribution of Deaths from Suicide in the United States
According to the Means Employed, 1940 to 1944

Means	1940	1941	1942	1943	1944
Total	100.0	100.0	100.0	100.0	100.0
Solid or liquid poisons	13.6	13.3	11.9	11.4	11.2
Illuminating gas	8.0	8.5	8.6	9.5	9.4
Motor vehicle exhaust gas	5.6	5.3	4.0	30	2.8
Other gas	2.5	1.5	1.1	1.1	.9

Firearms and explosives	37.4	37.3	38.0	37.0	36.3
Cutting or piercing instruments .	3.8	4.3	4.4	4.8	4.7
Jumping from high places	4.0	3.9	4.0	4.3	4.5
Crushing	.8	.9	1.0	.9	1.2
Other means	1.0	.7	1.3	1.2	1.1

Marital Status.—The incidence of suicide was much higher among the unmarried than among the married. In the United States in 1940 the death rate from suicide among single males was 66% in excess of that among married males; among widowers the excess was 198% and among divorced males 292%.

Among unmarried women the relative excess was less. Spinsters had a death rate 38% above that for married women, widows 63% and divorced women 261%. (U.S. bureau of the census, Vital Statistics—Special Reports, Vol. 23, No. 7, Nov. 1945).

Reasons for Attempted Suicide.-Detroit records for 1942 and 1943 provided data for a study of the reasons for attempted suicide (Statistical Bulletin of the Metropolitan Life Insurance company, Feb. 1945). It was found that, among men, almost 40% of the attempts (whether successful or not) were caused by ill-health, about 30% by domestic difficulties, and 4% by love affairs. Among women, domestic difficulties led in importance as a cause of attempted suicide, accounting for 50% of the total; ill-health was the motive behind 20% of the cases, and love affairs in somewhat more than 10%. The proportion of successes in the attempts at suicide varied strikingly with the motive. Among men, about one-half were successful where illhealth led to the attempt, about one-seventh where there were domestic difficulties and about one-tenth in love affairs. For women, one-quarter of the attempts were successful in cases of ill-health, one-fiftieth in cases of domestic difficulties but only 1 in 114 where there was a love affair. In connection with these findings, it is interesting to observe that, in the United States in 1940, mental diseases and deficiency were reported in about two-fifths of the total suicide deaths in which a contributory cause of death was mentioned.

Place of Residence.—In the United States, suicide was most frequent in large cities and least frequent in rural areas. In 1940 the death rate from suicide per 100,000 population (adjusted to allow for differences in age distribution) in cities of 100,000 and over was 15.6; for cities of 10,000 to 100,000, the rate was 14.9; cities of 2,500 to 10,000 had a rate of 14.8 and rural areas, 12.9. Considered geographically within the United States, the death rate from suicides is generally highest in the Pacific coast states and lowest in the southern states.

Sulphur

In the years prior to World War II, the United States produced about 80% of the world's output of sulphur, and Sicily most of the remainder. Aside from those two, only Chile produced amounts greater than 1% of the total. By 1942 the Sicilian industry had been badly disorganized, and after the invasion of Sicily, operations almost ceased.

Sulphur production in the United States increased 26% between 1937 and 1943, and then, in the peak year of war demand for most materials, declined to below the 1937 level. The reduction was not caused by any production difficulties, but followed several years in which stocks had been accumulated to such an extent as to permit a temporary relaxation in production activity. Even with the reduction in 1942, production exceeded consumption. In 1945 production shipments and consumption rose to a new record high, and approximately the same high level was maintained through the first eight months of 1946. The increased activity of 1945 and 1946 were more because of the improved export position than because of higher domestic consumption.

From 1939 to 1944 exports averaged as much as in 1937, and in 1945 rose more than one-third above this level.

Close to 90% of the sulphur consumption went into chemicals, fertilizers and insecticides, pulp and paper and explosives. Regardless of the end use, most of it was converted first into sulphuric acid. (G. A. Ro.)

mander of the 38th division at Camp Shelby, Miss., when Japan attacked Pearl Harbor. Later, he was made chief of the 8th army corps, and in Jan. 1944 he became deputy commander under Gen. Joseph W. Stilwell in the China-Burma-India theatre of war. Promoted to the temporary rank of lieutenant general in Sept. 1944, Sultan was made commander in chief of the Burma-India theatre a month later (after the split of the C.B.I. theatre into two commands). He headed the Chinese armies in Burma, Nov. 12, 1944, but came under the authority of Chiang Kaishek. On July 9, 1945, Pres. Harry S. Truman announced Sultan's appointment as inspector general of the U.S. army.

Sunday Schools

Fifty-one national and international bodies interested in Christian religious education through the Sunday school and allied agencies were federated with the World's Sunday School association at the end of the decade 1937–46. The association began as a movement for the extension of Sunday schools, and the Sunday schools of the world retained a primary place in the program of all its constituent bodies. But increasingly the concern of all these bodies broadened to take account of the entire range of factors and agencies involved in Christian religious education. At a meeting of the board of managers held in London, July 1–4, 1946, steps were initiated looking toward a change of name to World Council of Christian Education.

The programs of the constituent units of the association varied greatly during the decade, as was proper to a move-

ment everywhere indigenous. But the movement as a whole, or through some of its units, was concerned not only with the promotion and improvement of Sunday schools, but with Christian religious education through such means and agencies as the following: the family, schools and colleges, youth organizations, daily vacation Bible schools, weekday schools of religion, Christian literature, visual aids, the radio and whatever other means

might be employed for the teaching and learning of Christian truth and living.

The last world's Sunday school convention prior to

The last world's Sunday school convention prior to World War II was held at Oslo, Norway, July 6–12, 1936. It reported 369,510 Sunday schools in 129 countries, with 3,145,895 teachers and 34,139,624 scholars. There were no Sunday schools in the U.S.S.R. and Turkey.

War conditions caused the cancellation of plans to hold a world's Sunday school convention in Durban, South Africa, in 1940. In its place the quadrennial meeting of the council of the World's Sunday School association was held at Lake Mohonk, N.Y., May 8–11, with representatives of 20 countries present. Sultan, Daniel Isom

Total . . .

Sultan (1885—), U.S. army officer, was born Dec. 9, 1885, in Oxford, Miss. A graduate of the U.S. Military academy (1907), he served in the Philippines, 1916–17. He was transferred to Washington, D.C., after United States' entry into World War I and was attached to the war department's general staff from 1918 to 1919. In the latter year he was assigned briefly to the A.E.F. general staff in France. On his return to the United States he attended the Command and General Staff school, being graduated in 1923 and served in Nicaragua. Gen. Sultan was com-

fax, England, was re-elected president, and Dean Luther Allan Weigle, Yale university, chairman of the council and board of managers. Dr. James Kelly, Glasgow, and Dr. Forrest Knapp, New York, were elected general secretaries.

An International Congress on Christian Education, held in Mexico City, July 16–20, 1941, under the auspices of the World's Sunday School association and the National Council of Evangelical Churches in Mexico, was attended by 962 delegates from all of the countries of the western hemisphere, with a few from mission lands. The proceedings of the congress were published in English and in Spanish. It was preceded by a smaller Conference for Sunday School Workers held at Cuernavaca, Mexico, July 13–15, and followed by a Conference on Christian Literature for Latin America, July 21–25.

The congress noted the following as reasons for encouragement: increased Sunday school attendance in many countries, increased recognition that religious education had become an integral part of the work of the church, increased interest in the reading and study of the Bible, a mutual approach of evangelism and Christian education, the greater extent to which preparation for service in Christian education was being included in the training of ministers in theological schools, the development of education for lay service of various types and increased interest of youth, where free, in religion. It recognized the need for better curriculum materials, better prepared teachers and more effective provision for the underprivileged, including the great number of illiterates.

Sunday school enrolment decreased during World War II, partly because of the dislocations of population in all countries, and partly because movements appealing to Christian youth were increasingly suspect and for the most part banned in countries controlled by the axis powers. In Spain Protestant schools were "provisionally suspended" with no likelihood of the suspension being ended. Yet encouraging word concerning the maintenance of Sunday school work came from Czechoslovakia, Finland, Sweden and Norway. "The Christian front in Norway is the hardest to control," the Quisling newspaper stated; and active in that front were the teachers of the Norwegian Sunday schools. The printing and circulation of Sunday school literature continued in spite of the nazi ban, and at the end of the war Norway reported 3,497 schools, with 12,967 teachers and 211,163 pupils.

The National Committee for Christian Religious Education in China continued effective service, publishing Sunday school literature, guiding the training of lay workers in the free areas of China, administering relief and conducting Sunday schools for refugees in territory controlled by the Japanese. When the war closed, the Sunday school board of the Churches of Christ in Japan wrote to the headquarters of the World's Sunday School association asking for information, literature and religious films, "anything that will show the Japanese children that America is a good friend and neighbor to them, who have been taught in these years by the militarists and nationalists that the Americans were demonic enemies."

A sponsoring committee for the association's postwar program of reconstruction was headed by Edward V. Rickenbacker. On Dec. 14, 1945, the association issued an appeal endorsed by Pres. Harry S. Truman, King George VI, Generalissimo Chiang Kai-shek, Queen Wilhelmina, King Christian X, King Gustav V and King Haakon VII, which declared that a just and enduring peace "must rest upon the solid foundations of strong moral and spiritual

character . . . Only if the Church fulfills its teaching mission will future generations be blessed by the peace for which this generation is planning and praying."

The largest of the bodies federated in the World's Sunday School association in 1946 was the International Council of Religious Education, in which were associated the educational boards of 44 of the major Protestant denominations of the United States and Canada, enrolling almost half the Sunday school scholars of the world. At its annual meeting in 1940 this body adopted a comprehensive report on basic philosophy and policy, which was published under the title Christian Education Today.

Under the auspices of the International Council of Religious Education an authorized revision of the English Bible was begun in 1937 by a committee of scholars appointed by the council. The revision was in the interest of accuracy, simplicity and clarity. It sought to retain the beauty and power of the King James version, but to correct its errors and obscurities, and to eliminate obsolete and archaic forms of expression. The Revised Standard Version of the New Testament was published in Feb. 1946, and became at once a best-seller. The revision of the Old Testament was scheduled for completion in 1949.

Supreme Court of the United States

No single decade in the history of the United States supreme court saw as many changes in personnel and shifts of doctrine as did the years 1937–46. The court was remodelled not by adding to the personnel as originally contemplated by Pres. Franklin Delano Roosevelt in his projected court program, but by resignations and deaths.

During the beginning of the ten-year period, the division in court decisions followed a very definite pattern. The four so-called conservatives, Justices James C. McReynolds, Willis Van Devanter, George Sutherland and Pierce Butler, were generally agreed. Likewise, the three so-called liberals, Justices Louis D. Brandeis, Harlan F. Stone and Benjamin N. Cardozo, were agreed. Chief Justice Charles E. Hughes and Justice Owen J. Roberts held the balance, and the decisions primarily depended upon them. If one of them joined with the conservatives, that group had a majority. It was necessary for both of them to join with the liberals in order for the liberal group to be in the majority. This pattern underwent rapid changes with the overwhelming Roosevelt victory in 1936.

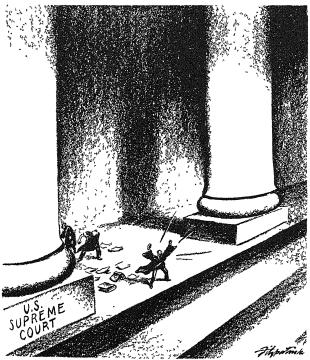

Evidence of a break in the conservative group was becoming manifest. Van Devanter retired from the court on June 2, 1937. Hugo J. Black succeeded him, having been appointed on Aug. 17, 1937. Sutherland, retired from the court on Jan. 18, 1938, was succeeded by Stanley Reed, who was appointed Jan. 25, 1938. The October term of 1937 started with one new justice and another was added in the middle of the term.

Cardozo died July 9, 1938, after a relatively brief period on the bench, and was succeeded by Felix Frankfurter, appointed Jan. 17, 1939, former dean of the Harvard Law school. The vacancy created by the resignation of Brandeis, who retired on Feb. 13, 1939, was filled by William Orville Douglas on April 4, 1939 The death of Butler on Nov. 16, 1939, occasioned the appointment of the fifth of Pres. Roosevelt's nominees to the bench, in the person of Frank Murphy, former governor of Michigan and U.S. attorneygeneral.

The last of the old guard, McReynolds, retired Feb. 1, 1941, to be succeeded by James F. Byrnes, appointed June 25, 1941. Robert H. Jackson was appointed July 11, 1941, to fill the vacancy created by the elevation of Harlan Fiske Stone to the chief justiceship, succeeding Chief Justice Charles Evans Hughes, who retired July 1, 1941. Wiley Blount Rutledge was appointed on Feb. 11, 1943, to succeed Byrnes, who resigned Oct. 3, 1942. With the resignation of Roberts July 31, 1945, Pres. Harry S. Truman had occasion to name his first appointee on Sept. 19, 1945, Sen. Harold H. Burton of Ohio. The death of Chief Justice Harlan Fiske Stone on April 22, 1946, occasioned the choice of Fred Moore Vinson, secretary of the treasury, as the thirteenth chief justice of the United States.

Among the outstanding incidents of the period was the celebration of the 150th anniversary of the court in 1940 (October term 1939), and the leave of absence of Justice Jackson during the 1945 term to serve as chief prosecutor in the trial of the nazi war criminals.

"What a Spectacle!" a cartoon by Fitzpatrick of the St. Louis Post-Dispatch expressing disapproval of the controversy between Justices Hugo L. Black and Robert H. Jackson in June 1946

The New Dissent.—Personnel changes were also reflected in notable changes of doctrine. The retirement of Mc-Reynolds and Chief Justice Hughes ushered in a new era for the court. The old dissent disappeared-because the old issues had passed, in its place came a new dissent with a different basis. The new court which emerged was not reluctant to overthrow principles established by precedent, and set out to strike a new balance in the old problem of the guarantees of the individual on the one hand and adequate federal power for the protection of social welfare on the other. Among the principles announced were (1) federal controls over business should be sustained whenever these could be justified; (2) labour organizations were to be favoured whenever possible, (3) the government should generally prevail over the taxpayer and (4) precedents need not be too rigidly binding.

The constitution did not mean the same thing to all members of the court. Conflicting interpretation of the commerce clause marked a clear break from traditional legal formulae and decisions were in the main said to be dictated by the economic and political philosophy of the justices rather than by strict adherence to constitution interpretation.

(B. We.)

Decisions of the Decade.—The most serious judicial blow to early New Deal legislation had been that of May 27, 1935, and this blow was struck by a unanimous court. Upon that date two opinions were handed down. The opinion in Schecter v. U.S., with the opinion of the court by Chief Justice Hughes and a concurring opinion by Justice Cardozo, substantially destroyed the National Industrial Recovery act. Upon the same day a unanimous court joined in an opinion by Justice Brandeis which held invalid the original Frazier-Lemke act with respect to farm mortgages (Louisville Joint Stock Land Bank v. Radford). These two cases probably had more influence than any others in bringing about Pres. Franklin D. Roosevelt's recommendation of Feb. 5, 1937, for the reorganization of the supreme court, although his recommendations would have had little effect upon the decisions of a unanimous court.

The president's recommendations led to much discussion and hearings by the Committee on the Judiciary of the U.S. senate running from March 10 to April 23, 1937, with an adverse report by that committee on June 14, 1937. It was frequently argued that the president's recommendation constituted a threat which forced a change in the attitude of the court. No changes in the personnel of the court occurred from Jan. to June 1, 1937.

In addition to the adverse decisions referred to above, the president's program was faced with two earlier decisions: Hammer v. Dagenhart (June 31, 1918), in which federal power was held not to apply to the shipment of child-made goods in interstate commerce, and Adkins v. Children's Hospital (April 9, 1923) in which it was held that a statutory regulation of minimum wages for women was violative of due process of law. Although Hammer v. Dagenhart was not specifically reversed until the Fair Labor Standards act was sustained in U.S. v. Darby Lumber Co. (1941), Justice Stone was correct in saying in that opinion that the principle of the Dagenhart case was abandoned in Kentucky Whip & Collar Co. v. Illinois Central R. R. Co. (Jan. 4, 1937). The Adkins case was specifically overruled in West Coast Hotel Co. v. Parrish (March 29, 1937).

With reference to interstate commerce, the spring of 1937 produced two cases of importance in addition to that of the Kentucky Whip & Collar Co. In Virginian Ry. Co.

v. System Federation (March 29, 1937), the court held that the Railroad Labor act applied to railway shop employees. And in National Labor Relations Board v. Jones & Laughlin Steel Corporation (April 12, 1937), the court with four dissents sustained the National Labor Relations act. The opinion of Chief Justice Hughes constituted the basis for a widened scope of national power over interstate commerce, although there were four dissents. On March 29, the court unanimously sustained a revised Frazier-Lemke act as to farm mortgages, this act having previously been held invalid by a unanimous court because of constitutional defects which were now removed (Wright v. Mountain Trust Bank, March 29, 1937).

On May 24, 1937, the court sustained the Social Security act with respect to unemployment compensation and old age benefits (Stewart Machine Co. v. Davis; Helvering v.

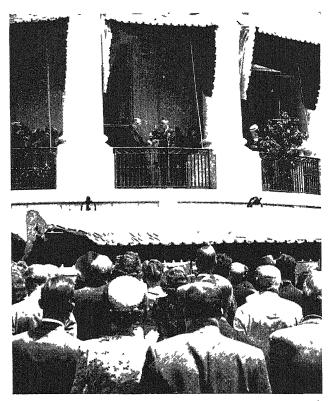

Davis, May 24, 1937).

There was no basis for the assertion that favourable opinions by the court from Jan. to June 1937 were occasioned by the president's action and there seemed to be a fair degree of certainty that they were independent of such influence during the period when the membership of the court remained unchanged. Such favourable decisions before June 1937 laid the basis for subsequent developments in the extension of governmental power over industry and in the expansion of federal authority through unlimited spending and interstate commerce powers. The foundation was fully established for the recognition of federal power to prescribe quotas of farm production for the farmer's use on his own farm (Wickard v. Filburn, 1942), and for federal control of insurance (U.S. v. South Eastern Underwriters Association, 1944).

The tendencies toward greater governmental regulation and toward greater federal regulatory power found a basis in changed economic and social conditions which made greater regulation necessary, and made once local problems national. The trend toward unrestricted national power found basis primarily in the commerce clause and in the taxing and spending powers.

Federal dominance was also strengthened by the court's emphasis upon the power of congress to exempt from state and local taxation the business of a federal agency common to private capital (Pittman v. Home Owners' Loan Corporation, 1939; Maricopa County v. Valley National Bank, 1943), and the power of congress to tax the business of a state agency engaged in enterprises generally pursued (State of New York v. U.S., Jan. 14, 1946). The position of the supreme court laid the foundation for the much-urged federal taxation of state and local bonds while continuing the exemption of federal bonds from state and local taxation. It was argued that the states were protected from abuse by virtue of their representation in the two houses of congress, but this ignored the fact that the U.S. political system was organized on a federal basis.

With reference to state taxation of intangibles, the supreme court made a vital change which purported to be for the advantage of the states. Beginning in 1929 the supreme court took the view that for two or more states to tax intangibles was violative of due process of law (Safe Deposit & Trust Co. v. Va.). Although he did not dissent in this case, Justice Stone opposed the principle and, with changed personnel of the court he was able in 1939 to obtain the adoption of the principle that every state could tax the same intangibles if "within the reach of the tax gatherer there" (Curry v. McCanless, 1939). This principle was strengthened in State Tax Commission of Utah v.

Fred M. Vinson, formerly secretary of the treasury, taking the oath of office as chief justice of the U.S. supreme court. Ceremonies took place at the White House in Washington, D.C., on June 24, 1946

Aldrich (1942), and was in 1944 substantially adopted as to movable tangibles, with strong dissent by Chief Justice Stone (Northwest Airlines v. State of Minnesota). Multiple taxation gave more than one state an opportunity to tax the same property, but created a confusion which the national government had to meet, or which the states had to adjust by reciprocal legislation. With respect to intangibles, such legislation was in force in a number of states.

The full faith and credit clause was put into the constitution for the benefit of the states and this was properly so stated in Magnolia Petroleum Co. v. Hunt (1943), but the statement was accompanied by an opinion prejudicial to the administration of state workmen's compensation laws. Such results encouraged a movement to have workmen's compensation transferred to the federal government. However, with respect to divorces, an opinion favourable to the states was rendered in Williams v. State of North Carolina (1945).

With reference to federal and state relations, expansion of federal authority during the decade was also found in *Screws* v. U.S. (1945), which took the view that federal control applied to state officers acting in their capacities as state officers, and in U.S. v. Classic (1941) and Smith v. Allwright (1944) with respect to the conduct of elections.

World War II constituted an essential element in the work of the supreme court. The court exercised its authority efficiently, being less restrictive than during World War I in its construction of the Espionage act and in its view as to freedom of speech. Although the court sustained all necessary actions in support of the war, including price control, the use of court martial and the use of Japanese concentration camps, it took a liberal view in the first definition of treason and in protecting civil rights, al-

though there might be some doubt as to its view with respect to the punishment of Japanese military officers.

Freedom of the press, of speech and of religion occupied a large part of the court's time during the ten-year period, the freedom of speech and religion centring on "Jehovah's Witnesses" and the most striking element being the sustaining of salute to the flag in Minersville School District v. Gobitis (1940), and the reversal of the Gobitis case in W. Va. State Board of Education v. Barnette (1943). Aside from this the most striking development was that which permitted the exercise of these freedoms upon private property (Murdock v. Commonwealth of Pennsylvania, 1943; Marsh v. State of Alabama, 1946). With respect to freedom of the press, the court adopted a wide view in regard to criticisms of the courts (Pennekamp v. State of Florida, 1946). The freedom of labour was also broadly recognized, although at least one member of the court doubted that equal freedom had been given employers.

The court at the end of the decade 1937–46 was liberal with respect to civil rights and sederal powers, although the foundation for its position was largely laid before the change in the court's personnel which began with the October term of 1937. Unfortunately, there appeared to be something of a quarrelsome attitude among its members which at times reflected itself in their opinions—a situation which had presented itself only once before with respect to Hepburn v. Griswold (1870), and which did not then appear in a printed report. Moreover, the numerous concurring and dissenting opinions exceeded those of other days, often added nothing to the case and implied ignorance of a possible paper shortage upon the part of members of the court. (See also Law.) (W. F. D.)

Surgery

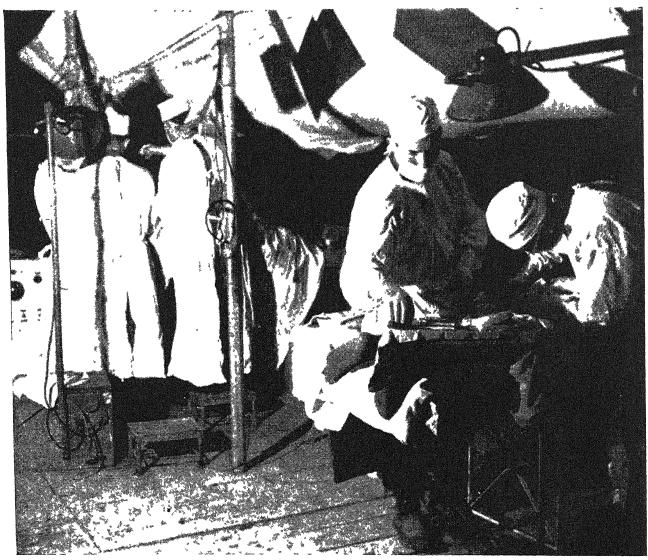

The years 1937-46 were indeed ten eventful years in the progress of surgery. In spite of World War II, or probably because of it and its resultant stimulation to investigation of surgical problems, advances were rapid. The understanding of wound healing was on a sounder basis than ever before. Whereas for many years it had been known that wound healing was poor in patients with scurvy, only within the decade was it shown that a vitamin C deficiency interferes with the deposition of scar tissue, and that an optimum vitamin C content of the body is necessary for wounds to heal. Also, for some time it had been known that in patients with malnutrition wounds heal poorly. It was shown that a deficiency of the body proteins retards wound healing because of the swelling of the tissues surrounding the wound and the deficient deposition of fibrin which is essential for wound healing. Later, Champ Lyons showed that not only is it necessary to determine the percentage content of the plasma proteins, but also the total circulating plasma protein, because even though the plasma protein per cent value may be within the normal limits because of a decrease in the blood volume there may be a decrease in the total circulating protein and a consequent interference with wound healing. Also, the ordinary blood count and haemoglobin determination in the chronically ill patient is of little significance because of alteration in the blood volume, and unless the latter is determined, the presence of a severe anaemia is likely to be missed. Because of the decreased blood volume in these patients this condition was designated as chronic shock by Lyons.

Wound healing is greatly influenced by the type of suture material used. Whereas previously catgut had been the suture of choice, nonabsorbable sutures became much more popular during the decade. Steel wire was used by many surgeons. As a result of the investigations of W. H. Meade and Alton Ochsner, cotton was found to be superior to most sutures and was employed extensively in the place of other suture materials.

With the introduction of chemotherapy, better control of infections became possible. Sulfonamides were efficacious in many infections, particularly streptococci, but it was shown that in the presence of necrotic and purulent material, they were relatively ineffectual because of the presence of sulfonamide inhibitors, especially aminobenzoic acid. As originally shown by Evarts Graham, sulfonamides interfere with wound healing and, although sulfonamides were used extensively prophylactically before World War II, as a result of investigations done under the auspices of the National Research council, they were found to be of value in the prevention of wound infection and they were harmful when used locally. Sulfonamides are also toxic and should not be used indiscriminately. Other antibiotics which proved to be of great value were penicillin and streptomycin. Penicillin is effective against most streptococci, most staphylococci, gonorrhoea and syphilis. It is almost without toxicity and is very effectual in the prevention, control and treatment of many infections. With the introduction of these chemotherapeutic agents, the mortality rate from invasive infections of the soft parts, osseous tissue and the serous cavities was greatly diminished. Streptomycin, a newer antibiotic, was found particularly efficacious in the control of Gram-negative bacillary infection and particularly valuable in the control of many proteus urinary infections. It was valuable also in the treatment of tularaemia and influenzal meningitis. Its use in tuberculosis appeared promising.

Actinomycosis of the thorax and abdomen which previously had been difficult to control was treated successfully by Champ Lyons by the combination of several methods of therapy: (1) adequate surgical drainage; (2) chemotherapy, with the use of penicillin during the acute phase of the infection to be followed by prolonged administration of sulfonamides; (3) the administration of large amounts of whole blood during the acute infection in order to restore the total circulating haemoglobin and red cell mass.

The prevention and treatment of venous thrombosis continued to be of great importance because this condition was responsible for many unnecessary fatalities and many more instances of disability caused by persistent sequelae following inflammation of the veins with associated thrombus ("milk leg"). It is necessary to differentiate between two types of venous thrombosis, as emphasized by Ochsner and Michael DeBakey, one in which there is a typical "milk leg" with fever, swelling of the leg and pain and the other in which there are few or no symptoms. In the former (thrombophlebitis) the clot is firmly attached to the vein and except in rare instances does not become detached to be carried to the heart and lungs, but the patient's symptoms persist for weeks and years. In the latter (phlebothrombosis), the clot is not attached to the vein and although it produces few symptoms, a fatality is likely because the clot is early detached and can be carried to the

Front line evacuation hospital in Italy during 1944, showing U.S. army surgeons with two patients in the surgical tent. The team at the right was treating shell fragment wounds and that at the left was performing a brain operation

heart and lungs, resulting in a sudden fatality. The treatment of venous thrombosis consists first of prophylaxis and can be accomplished by speeding up the blood flow through the veins in lower extremities where these thrombi predominately occur. This is facilitated by deep breathing, bed exercises and by getting the patient out of bed early after an operative procedure. Anticoagulants, such as heparin and dicoumarol are occasionally useful prophylactically. A patient with true "milk leg" in which there is swelling and pain of the extremity is best treated by anaesthetizing, with procaine, the sympathetic ganglia supplying that extremity which increases the blood flow. On the other hand, the treatment of a patient with phlebothrombosis consists of ligation of the vein before the clot has had a chance to become detached.

There were few conditions in which the treatment was so changed within the decade as in the treatment of burns. The crystallization of ideas concerning treatment of burns was undoubtedly the result of the investigations made during World War II. Whereas previously tannic acid was a favourite method of treatment, it was repeatedly shown that tannic acid is dangerous not only because it destroys tissue

locally, but also because of absorption of the drug into the body, producing liver damage. Burns should be treated as any other wound. They should be carefully cleansed under sterile precautions and following this, compression bandages should be applied. Because the burned patient loses considerable fluid and protein, it is necessary to replace it. Whereas previously it had been felt that the administration of salt solution or plasma was particularly advantageous in these cases, it was shown by F. A. Coller and his colleagues that the administration of whole blood is essential to the severely burned individual. G. J. Connor and S. C. Harvey showed that the application of pyruvic acid to the burned area in which there is considerable destruction of skin would bring about a more rapid separation of the dead tissue, permitting the application of skin grafts early enough.

Considerable work was done in vascular surgery. A number of congenital anomalies affecting children were treated successfully by operation. Persistence of a communication between the aorta and pulmonary artery which is necessary in the foetus, but which normally closes after the birth of the child, is responsible for heart disease. This communication was divided and the normal mechanism re-established. Blue babies with congenital defects in their heart and blood vessels were treated by making a new opening

between two of the large arteries in the chest. Alfred Blalock performed this operation in many instances and, although an abnormal condition results from the operation, the condition is very much better than the original congenital defect. Another congenital abnormality of the blood vessels is a narrowing of the aoita known as coarctation. This anomaly, which causes marked elevation of blood pressure in the upper extremities, was corrected by removing the narrowed portion of the aorta and reuniting the two ends. This pioneer work was successfully done by C. Crafoord and Robert Gross.

The use of internal secretions in surgical conditions gained considerable interest. It was shown by C. Huggins that cancer of prostate, which previously was extremely difficult to treat, could be treated quite satisfactorily, although cures did not result, by removal of the testicles or by the administration of the female sex hormone, stilbestrol. In women with cancer of the breast with extension to the bones, relief of pain and recalcification of the bone was obtained by the administration of the male sex hormone.

Banti's disease, which had been unsatisfactorily treated previously, had been shown to be the result of an increase in blood pressure within the portal venous system. In order to prevent the symptoms produced by the condition, two procedures were used: (1) the making of a new opening between the portal vein and inferior vena cava or (2) a communication between the portal and systemic circulations by anastomosing the left renal vein to the splenic vein. This could be done either by direct suturing of the vessels or by the use of a vein-lined vitallium tube, as suggested by Arthur H. Blakemore.

Vitallium, an alloy, became very popular for use in surgery. It contains no iron but is composed of chromium, cobalt and molybdenum. It had been used for a long time in dentistry and can be implanted in body tissues because it produces practically no electrolytic reaction. It was used for plates to hold fractures and to reconstruct ducts within the body. Later a newer metal, tantalum, was introduced because it has the advantage over vitallium that it can be more readily handled; it can be cut, bent and hammered, whereas vitallium has to be cast to fit the part.

Heart disease, particularly coronary thrombosis, which continued to be responsible for so many deaths, was attacked surgically. The severe pain associated with angina pectoris was relieved either by injecting the sympathetic nerves with alcohol or by removing them. Claude S. Beck was able to increase the blood supply to the heart muscle by exposing the heart and either applying a flap of muscle from the chest wall to the heart or by introducing irritating substances, such as asbestos, into the pericardial cavity to produce new adhesions between the heart muscle and the surrounding tissues. These operations resulted in marked relief of symptoms and prolongation of life.

Operations on the digestive tract became much safer and more frequently performed. Whereas previously a cancer or obstruction of the oesophagus was not amenable to surgical treatment, it became possible during the decade to remove large portions, even the entire thoracic oesophagus, and to re-establish the normal continuity. These operations were done through the chest, making an opening in the diaphragm so that the oesophagus and adjacent stomach could be resected. It was possible in this way not only to remove cancer of the oesophagus and the upper part of the stomach, but also to remove strictures of the oesophagus as well. Complete removal of the stomach through the chest was made possible. Whereas the treatment of spasmodic contraction of the opening of the stomach had consisted primarily of dilatation, much was done to secure a

more permanent result in these cases. In these instances, a new opening between the stomach and the oesophagus completely relieved the patients of their symptoms. Although ulcers of the duodenum were treated medically and probably should continue to be, it was quite generally agreed among surgeons that in ulcer of the stomach, because of its great tendency to become cancerous, partial removal of the stomach should be done. In the intractable ulcer of the duodenum, resection of a considerable portion of the stomach was the method of choice.

A conservative procedure for the treatment of duodenal ulcer was suggested by L. R. Dragstedt. This consisted of removing portions of the two vagus nerves supplying the stomach, following which the acid content of the stomach was diminished. Following this relatively simple procedure, the patients were relieved of their symptoms, although this operation was not without disadvantages, the results up to the end of the decade were quite satisfactory. A longer period of time was required for a true evaluation of this conservative procedure.

Operations on the liver and bile ducts in the presence of jaundice previously had been attended with a high mortality rate, because of the danger of haemorrhage. It was shown that this haemorrhagic tendency is the result of a deficiency of vitamin K, which is normally absorbed from the intestine during the digestion of fat. Whenever there is an obstruction to the flow of bile into the intestine, an interference with fat digestion occurs, preventing the absorption of vitamin K. As a result of the deficiency, the formation of thrombin, which is essential for blood clotting, is interfered with; this condition is responsible for the haemorrhagic tendency. Vitamin K was made available synthetically and can be supplied to these patients preoperatively, thus preventing the bleeding tendency in jaundice.

Although benign tumours of the pancreas had been operated upon successfully, malignant tumours of the pancreas were not amenable to surgical treatment. As the result of the investigations of Allen Whipple, it became possible to remove large portions of, or even the entire pancreas for cancer. Stones in the pancreas, producing severe pain, were successfully treated by removal of the involved portion of the gland.

The preparation of a patient with a toxic goitre for operation was greatly facilitated by the use of a thiouracil, a drug closely allied to the sulfonamides. A temporary chemical thyroidectomy is produced, resulting in a marked diminution of the toxic manifestations. Although the drug is toxic and must be used cautiously, it proved of great value in the treatment of many patients with toxic goitre. Another substance, propylthiouracil, much less toxic, was used and was found to be equally efficacious in the preoperative preparation of these extremely ill patients. Acute inflammation of the thyroid gland (acute thyroiditis), which previously required prolonged therapy, also was successfully treated with thiouracil.

Great advances were made in surgery of the lung. Cancer of the lung, the incidence of which was increasing, was treated successfully and with surprisingly low mortality rates by removal of the lung. Although the treatment of tuberculosis continued to be largely conservative, consisting principally of rest and good food, many were benefited by collapse of the lung. A few cases were treated by surgical resection of the involved lung. This method of therapy had to be limited to relatively few cases, and the indications for its use were very strict.

Even high blood pressure became a surgical condition in many instances. Although most cases had to be treated medically, there were some individuals, particularly the younger ones, who were benefited by the removal of sympathetic nerves. Although the results obtained by this procedure were not so gratifying as originally anticipated, all patients were relieved of their symptoms by the operation, and in many instances a normal blood pressure was obtained.

Great advances were made in plastic surgery. The perfection of the dermatome by Earl C. Padgett, an instrument which permits the cutting of a calibrated thickness of skin, was of great value. It became possible to cut skin of any desired thickness and of relatively large size. The use of preserved isocartilage taken from another patient or from an individual at necropsy was of importance. It was no longer necessary for the patient to donate his own cartilage when a transplant of cartilage was necessary. The isocartilage was not quite so satisfactory as the cartilage obtained from the patient himself, because there was always a certain amount of absorption. On the other hand, it proved to be as resistant to infection as (or even more so than) the patient's own cartilage obtained from another part of his body.

Whereas, previously it had been necessary to rely upon ligation of vessels and compression to control haemorrhage, great advances were made in the use of haemostatic substances during the decade. With the stimulus given to the study during World War II, it was found that fibrin, a normal product of the blood, could be made into a sponge and when left on a bleeding surface would tend to stop the haemorrhage. This was particularly true when combined with thrombin, which is normally responsible for clotting. In addition to fibrin foam, obtained from human and other blood, two other substances were made available as haemostatic agents. Gelatine foam has more body than fibrin foam and therefore is easier to use. When left in a wound, absorption occurs without reaction. Another substance, oxidized cellulose, was used as an effective haemostatic agent. All of these substances were of great value to the neurosurgeon in controlling oozing from the brain and to the general surgeon in controlling oozing from such organs as the kidney or the liver, from which haemorrhage can be stopped only with difficulty.

Myasthenia gravis, a condition in which there is severe muscular weakness, resisted most forms of therapy. It was treated successfully in many instances, however, by removal of the thymus gland, a small gland in the chest. Alfred Blalock showed that many of these patients can be operated upon safely and have their normal strength reestablished.

As the result of wartime experiences many patients with severe injury to the lung or infection of the pleural cavity were rehabilitated relatively quickly by removal of blood clot or fibrin which forms on the surface of the lung. Unless this procedure is used the lung may not re-expand, because it is kept in a contracted position by the clot which may be changed into scar. By the removal of the fibrinous mass two to three weeks after injury or after infection, the lung is allowed to re-expand and re-establish its normal function. Surinam (Dutch Guiana)

A Netherlands colony in northeastern South America, Surinam is bounded on the east by French Guiana, on the south by Brazil, on the west by British Guiana, and on the north by the Atlantic ocean. Area, 54,291 sq.mi. The population by 1944 estimate was 191,628; earlier official estimates were as follows: 1938, 173,089; 1940, 177,980; 1941, 183,730; 1943, 189,484. The population included approximately 1,000 Dutch, 1,000 other Europeans and Americans, 50,000 British Indians, 35,000 Javanese, 2,400 Chinese, 19,-000 bush Negroes (or Djukas) and 2,600 aboriginal Indians. The capital is Paramaribo (pop., 60,723), where some twofifths of the white population lives; other inhabited places include Nieuw Nickerie (5,000), Coronie (4,500) and Moengo (1,400). The colony is ruled by a governor, who serves as president of an executive council of four, all nominated by the queen of the Netherlands. A legislative body, the states of Surinam, includes 15 members, 10 elected and 5 appointed by the governor, all for a term of four years. The colony is divided for administrative purposes into 16 districts. The judiciary, appointed by the crown, is headed by a supreme court at Paramaribo. Governors in the decade 1937-46 included Dr. J. C. Kielstra, 1933-Jan. 3, 1944; Dr. J. C. Brons, after that date.

* * *

LITTLE of consequence occurred in the colony until about a year and a half after the invasion of the Low Countries by Germany. As a result of an earlier agreement between the United States and the Netherlands government-in-exile at London, United States troops arrived in the colony Nov. 24, 1941, with the object of providing necessary protection to the colony's valuable bauxite mines. The United States simultaneously assumed responsibility for protection of a refining plant at Paranam, on the Surinam river about 20 mi. above Paramaribo. The government of Brazil, in a corollary action, pledged itself to maintain military vigilance along the Brazil-Surinam frontier. The troops, whose numbers were not disclosed,

Native women of Surinam, parading in 1943 as auxiliary members of the Dutch colonial army

were located in some 20 or more camps and acted solely in a military capacity. The United States emphasized that its presence in Surinam in no way constituted an occupation and that Netherlands sovereignty was not in any degree infringed.

The effects of World War II continued to be mixed. Normal trade channels were even more disturbed in 1942 than previously, because of axis submarine activity in Atlantic and Caribbean waters and the lack of shipping for the customary products; but the booming bauxite exports, which in 1941 had almost equalled the combined total for 1939 and 1940, and the presence of United States troops in the colony provided an economic counterpoise. An important political event was the pledge made by Queen Wilhelmina on Dec. 6, 1942, that a postwar "equal partnership" of the Netherlands overseas territories with the mother country would be established; this was interpreted in Surinam to mean a subsequent grant of practically complete local autonomy. The arrival in late Dec. 1942 of 122 Netherlands refugees intending to settle in the colony aroused considerable interest as a possible portent of the future.

Trade conditions eased in 1943, and shortages became less acute, chiefly because of the decline of the axis submarine menace in western Atlantic and Caribbean waters. Bauxite mining continued at practically double the prewar rate of production. The colony was visited in Nov. 1943 by Crown Princess Juliana of the Netherlands, the first member of the royal house of Orange ever to go to Surinam. Earlier in the year a Surinam economic mission visited Brazil; the first Brazilian consul ever accredited to the colony arrived at Paramaribo on May 13. Surinam's first daily newspaper, Het Nieuws, began publication Aug. 3, 1943. The colony was faced in 1943 with an acute shortage of subsidiary coins, which was relieved in part by assistance from the United States mint. Agricultural production was abnormally low in 1943 except for pineapples, which more than doubled the volume of the preceding year.

Relative economic prosperity continued to prevail in

Surinam in 1944, with agricultural production generally above the low of 1943. The colony continued to feel considerable concern, however, because of the likelihood that bauxite, which in recent years had formed more than ninetenths of Surinam's exports, would be in sharply reduced demand with the tapering off of war needs. Plans were consequently made for financial retrenchment, although the first Netherlands government loan ever launched in Surinam was successfully floated; it totalled 4,000,000 guilders at 21/2%. Plans were presented to the legislative assembly in June looking toward provision of funds for better housing and for improving educational and agricultural facilities. Representatives of Surinam took part in the first West Indian conference, held at Bridgetown, Barbados, Mar. 21–30, 1944, under the auspices of the Anglo-U.S. Caribbean commission. That agency, formed two years earlier to serve the joint research and advisory needs of the British and United States possessions in the Caribbean area, had begun to seek the co-operation of Dutch and French representatives and to broaden the basis of participation and the scope of interest. The conference in Barbados discussed plans for increasing local food production and raising standards of living, quarantine and health protection and other matters of common interest to the area. It urged that secondary industries be developed where practicable, as a means of broadening the economic base of the various colonies.

The colonies' chief problems in 1945 were those of reconversion from the World War II period. It was announced late in the year that a committee headed by a former governor would be sent subsequently to study financial and economic conditions for the Netherlands government; one of the chief problems to be discussed was that of a possible adjustment in value between the Surinam and Curação guilders. The position of the guilder tended to be weakened in mid-1945 because of devaluation in the Netherlands with respect to the pound sterling. A serious shortage of dollar exchange existed early in the year. Trade in 1945 continued to be largely with the United States, a shift which had taken place during the war because of the disruption of the previously normal trade with the Netherlands. Large stock piles of bauxite built up at Paramaribo during the year. Steamship sailings continued to be irregular throughout most of the year, and Pan American Airways curtailed certain of its services to Surinam in 1945, although K.L.M. (Royal Dutch Air Lines) was understood to be planning a considerable postwar expansion of its network, partly based on Surinam. Service on a portion of the short rail lines existing in the colony was abandoned in 1945 because it was not self-sustaining. The colonial government late in the year studied plans for the expenditure of 15,000,000 guilders for public works over a period of five years; dredging projects in the lower reaches of certain rivers, especially the Surinam, were a feature of this program.

The colonial government organized a department of social affairs and immigration early in 1946. Officials representing Surinam participated in a joint conference on Caribbean problems with British, French, and United States representatives, meeting at St. Thomas, Virgin Islands, beginning Feb. 21, 1946. As a partial offset to the questionable future of the bauxite industry in Surinam, interest revived somewhat early in 1946 in the possibility of gold mining, although the outlook was not especially bright in view of the lack of new fields to exploit. The anticipated financial mission arrived at Paramaribo early

in 1946 and began consideration of the adjustment of the Surinam monetary system to the Netherlands guilder. The colonial government was anxious to keep the money at its existing level with United States currency but by March it appeared likely that the Surinam guilder would subsequently be devalued.

Surplus Property Administration

See Surplus Property Disposal, U.S.; War and Defense Agencies.

Surplus Property Disposal, U.S.

Surplus property disposal was first recognized as a special function in 1933 when the procurement division of the U.S. treasury department was assigned responsibility for disposing of surplus of World War I and even some property dating from previous wars.

World War II increased the importance and, in an enormous degree, the magnitude of the task. At a breath-taking pace, war production rushed to meet the demands of modern war. An endless assortment of property of almost every description began to accumulate as surplus as the war developed and war requirements changed. Implements became outmoded almost before they had left the production line. For example, 800 modifications were made in the original specifications of the B-17 bomber, each involving thousands of "change orders" and throwing into the surplus heap millions of parts.

At the request of President Roosevelt, Bernard Baruch and John Hancock made a report which, among other things, recommended a central authority. The Surplus War Property administration (SWPA) was accordingly created under executive order No. 9425, Feb. 19, 1944, and charged by the president with general supervision and direction of the surplus disposal program.

On Oct. 3, 1944, the Surplus Board act was approved. Its major aims, while conflicting in some respects, were to make maximum use of surplus property, establish a system of priorities for the disposal of surplus and to use existing facilities for such disposal. The act created a three-member board to carry out its provisions.

On Sept. 18, 1945, congress amended the act to replace the board by a Surplus Property administration headed by a single

surplus property administrator. This centralization of authority in one individual was the only effect of the amendments; the SPA carried on the same functions as the predecessor board.

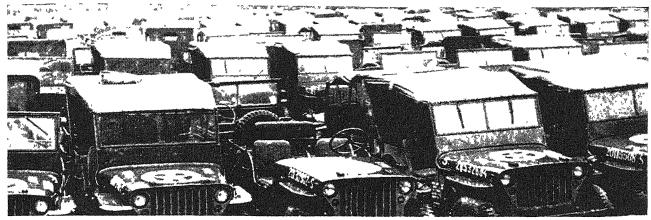

The two final redistributions of the functions originally assigned the Surplus Property board were brought about by executive order No. 9689, effective Feb. 1, 1945. By this time the SPA had largely completed an initial task of policy formulation.

World War II was over. Surplus was accumulating at an increasing pace. The time for more active disposal had arrived.

Accordingly, the Executive Order provided for the abolition of SPA and for the transfer of its function to the War Assets corporation. Excluded from this transfer was authority over surplus property abroad, which became the responsibility of the state department. Finally, and as a result of the same order, the War Assets administration came into being on March 25, 1946, taking over the functions of WAC.

Previously, the various disposal agencies had operated under and as subsidiaries of other and more permanent agencies using the facilities of such agencies for actual disposal operations. The WAA, however, was created as a separate unity. It co-operated with other agencies but functioned primarily on its own, handling the entire disposal program for over 90% of all surplus.

By late 1946, in round numbers, \$13,200,000,000 worth of surplus war property had been sold by domestic disposal agencies, mainly the War Assets administration. Preliminary estimates set this figure at 31% of total World War II domestic surplus eventually to be disposed of in the United States, its territories and possessions. An overall total of \$34,000,000,000 of eventual surplus was anticipated. Inventory was \$9,500,000,000 which left approxi-

Reconditioned jeeps lined up at a U.S. depot in England in 1945. They were part of the huge store of U.S. surplus property throughout the world which was then awaiting disposition

mately \$24,500,000,000 still to be declared by the owning agencies. (See also Investments Abroad, U.S. and British; Lend-Lease.) (H E. By.)

Suzuki, Kantaro

Baron Suzuki (1867—), Japanese statesman, was born Dec. 24, 1867, in Osaka. A graduate of the Japanese naval academy in 1887, he held many important posts in the Japanese navy, including that of commander in chief of the combined fleet and chief of the navy general staff. In 1929, he was named grand chamberlain and privy councillor concurrently. Following his resignation as grand chamberlain in 1936, he was made a baron. That same year, Suzuki was wounded in a revolt staged by young Japanese army officers, because he allegedly opposed the army extremists who dominated the government. In Aug. 1944, he became president of the privy council.

After the fall of Premier Kuniaki Koiso's cabinet (April 5, 1945.) Suzuki formed a new government. On July 29, 1945, he rejected the U.S.-British-Chinese surrender terms formulated at the Potsdam conference, but the emperor's acceptance broadcast of the decision to accept the surrender terms (Aug. 15) forced the resignation of Suzuki's cabinet. In an interview later, he was reported to have declared that he had sounded out the soviet union in June 1945 on the possibility of peace, but that this "feeler" was ignored.

According to a U.S. broadcast from Tokyo, Sept. 15, 1945, Suzuki went into hiding after the end of the war to escape possible assassination at the hands of vengeful Japanese militarists.

Swanson, Claude Augustus

Swanson (1862–1939), U.S. secretary of the navy, was born at Swansonville, Va., on March 31, 1862. He graduated from Randolph-Macon college at Ashland, Va., in 1885; the next year he received his degree in law at the University of Virginia, was admitted to the bar, and began practice at Chatham, Va. His first venture into national politics was successful when, in 1893, he was elected to the U.S. house of representatives. From 1906 to 1910 he was governor of Virginia and from 1910 to 1933 U.S. senator from that state. He was appointed chairman of the senate's naval affairs committee in 1918 and secretary of the navy by President Roosevelt in 1933. When he took office in the

cabinet, the United States had only 17 warships under construction. When he died at Rapidan camp, Va., on July 7, 1939, the naval forces had been increased by 197 ships either built or under construction.

Sweden

A democratic monarchy of northern Europe, Sweden has an area of 173,341 sq.mi.; pop. (Dec. 31, 1944) 6,597.348. Capital, Stockholm (671,525). Other principal cities: Göteborg (Gothenburg) (296,289), Malmö (167,885), Norrköping (75.792), Hälsingborg (65.357), Örebro (58,590) Religion Lutheran Evangelical. King Gustavus V reigned throughout the decade 1937–46 (since 1907). Prime minister from 1932 until his death on Oct. 6, 1946, was Per Albin Hansson; he was succeeded by Tage Erlander.

Fortified Camp.—Although Sweden was not involved in World War II, its national life was dominated by this catastrophe most of the decade 1937-46. In the prewar years the Swedish people were increasingly disturbed by the bellicose trend in international affairs. During the war itself they became isolated by German military power and preserved their independence only by a united, determined moral resistance, backed by feverish rearmament, and to a certain extent, at first, by certain concessions to Germany which seemed necessary to the responsible Swedish authorities at the time. By 1940, Sweden had become in effect a small fortified camp inside a big one. Both during the war and after it was over, unprecedented aid was given to countries less fortunate. In proportion to population the number of refugees in Sweden would have corresponded to about 4,000,000 for the U.S. Gifts to other countries added up to more than 1,000,000,000 kronor (about \$280,000,000, or an average of \$54 per person); 1 kronor was equal to 26 U.S. cents at par, 23.86 cents on Nov. 28, 1945.

During the war itself all elections, both national and local, were held as usual. "One way to defend democracy is to practise it" said prime minister, Per Albin Hansson. When war came close to Sweden in the fall of 1939 through Russia's attack on Finland, the Social Democrats invited the leaders of all other parties, except the Communists, to join them in a cabinet of national union, which held power throughout the war. In 1945, however, when the war was over in Europe, the Social Democrats, who had made large gains in 1940 and still held a working majority in both houses after the election in 1944, resumed sole executive authority.

In foreign affairs, Sweden retained its membership in

the League of Nations to the end, but when the war broke out announced its resumption of its traditional neutral attitude of more than 130 years, as did all the other northern states. Swedish military power of resistance grew during the war and German strength simultaneously declined; transit permits were cancelled in the fall of 1943 and a year later all commercial exchange of goods between the two countries ceased. Toward the end of the war more and more facilities and services were granted to the Allies.

The Prewar Years.—In order to understand the internal political situation in Sweden at the beginning of 1937 it is necessary to review briefly the preceding years. Although by 1935 the Swedish riksdag had been in existence for 500 years and the kings themselves had originally been elective officers, there had been no thoroughly democratic system of government based on universal suffrage, regardless of property qualifications, until the end of World War I. Universal suffrage, regardless of both wealth and sex, was then introduced, giving greatly increased power to the organized industrial workers, enrolled in the Social Democratic party, which was led by Sweden's great statesman, Hjalmar Branting. Earlier in the century, parliamentary control over the government, best exemplified by the British and the French systems, had been introduced, making the prime minister, usually the leader of the largest party, the real executive instead of the king.

In 1917, leaders of the Social Democratic party headed by Branting had entered the government for the first time, then sharing executive power with the Liberals. After World War I was over, they formed several cabinets of their own, though in the minority. In the 1928 election, when hope of a permanent, capitalistic prosperity was still over the land, they had lost several seats and were replaced by the Conservatives. In 1932, when the depression had at last struck Sweden, they were restored to power and given the task of finding a cure for unemployment. This they did by increasing social welfare payments to stimulate the domestic demand for goods and by borrowing money for public works. Taxes on large estates and incomes were increased. As foreign trade revived, however, the country recovered more quickly than had been expected, and the emergency loans were repaid much sooner than planned. The partly subsidized building boom that began in 1934 helped materially in breaking the depression.

In the 1932 election the Social Democrats had polled for the first time more than 1,000,000 votes giving them 104 seats in the dominant second chamber. Year by year, they had also made gains in the indirectly elected first chamber, renewed at the rate of one-eighth of its membership annually, but they still lacked working majorities in each of the two houses. To put through their projected unemployment program they then made an alliance for the first time with the Farmers' Union, a World War I offshoot of the Conservative party and still one of the small minority groups. In return the farmers, mostly small land owners, were promised not only their share of the improved social welfare measures, but also guarantees of stable prices on their products. Previously the practice had been to help the farmers by increasing import duties on grain, but as that also boosted the price of bread for the industrial workers as well as for all other inhabitants, the method of using government subsidies to guarantee minimum prices was used. This put the burden, of course, on the general taxpayers, and chiefly on the large income receivers and large property owners.

Incidentally, the system of government purchase of sur-

plus grain to sustain falling prices led to the accumulation of a large grain reserve which turned out to great advantage when the two successive crops of 1940 and 1941 failed and Sweden was prevented by the German blockade from resorting to imports. By improved methods, better seed and increased use of commercial fertilizers between the wars, the Swedish farmers increased productivity so as to make the country for the first time normally independent of imports for bread stuffs. The crop failures caused by unfavourable weather, however, could not be prevented, and only the stored surplus saved the country from having to ask Adolf Hitler for bread. In 1917, Sweden had had to cede part of its merchant marine to the Allies in return for the right to buy foreign grain. But whereas the ports were then open, in 1940-45 they were blockaded by both sides in the war. Thanks to the experience of 1917, Sweden also began in 1936 to store up imported raw materials which helped to tide it over the actual war.

In the 1936 election, the Social Democrats had advanced to 112 seats in the second chamber out of a total of 230, or still a few seats short of an absolute majority. They then made a further advance toward a worker-taimer alliance by inviting the leaders of the Farmers' Union to join them in the new cabinet. (During the election campaign the farm group had formed for the first time an interim, hold-over government, giving the labour leaders more time for electioneering.) The election outcome was a distinct endorsement of the Labour program; having achieved a coalition between the organized workers and the capitalistic small farmers, the returning prime minister, Per Albin Hansson, was naturally in a triumphant mood as the 1937 riksdag was about to open early in January.

On Jan. 2, 1937, Hansson published in the chief party organ, Social-Demokraten, of Stockholm, a signed atticle in which he advocated a strong government, checked always by an alert opposition. In writing this he may have had the dictators in both Berlin and Rome in mind, but the lesson was not lost on the Swedish opposition leaders either. In 1933 they had greatly deplored the alliance between the organized industrial workers and the farmers; in previous years the Social-Democrats had formed temporary coalitions, or working agreements, with the Liberals, but this was something new and unexpected.

As far as further improvements in the social welfare situation were concerned, several Liberal party organs declared that they would go a long way to support the Labour-Farmer government. But if it was to be a question of nationalizing more private enterprises, they would offer the most determined opposition.

In his address from the throne to the 1937 riksdag, in effect the government's own program, King Gustavus had said that the decrease in unemployment and the improvement in the country's economic situation warranted increased appropriations for social welfare, particularly adjustments in the old age pensions in accordance with the higher costs of living in some localities. This was the proposal on which the Social-Democrats had been defeated in the spring of 1936 and on which they had formally decided to resign and appeal to the electorate. In the spring of 1937, such a law was passed. Other measures of a similar type were adopted later.

By 1937, all government loans for public works to aid the unemployed had been paid off. The gain in 1936–37 revenue had been 59,000,000 kronor over that for 1935–36. The income estimated in the proposed budget for 1937–38 showed an advance of 96,000,000 kronor or close to 9%. This increase came partly from the higher earnings of government-owned utilities and partly from the increased

Refugees arriving on skis at the border of neutral Sweden in 1944. As the last haven among the Scandinavian nations, Sweden was generous in extending aid to those most urgently in need of medical attention or food both during and after World War II

yields of previously imposed taxes, chiefly those on income, both categories indicating a rising state of prosperity. A year later, in Jan. 1938, the 1937–38 budget was overbalanced; it showed a surplus of 19,000,000 kronor, a modest enough sum, but which, by the end of the 1938–39 budget year, was expected to be between 175,000,000 and 195,000,000. But before June 30, 1937, the government proposed to use 123,000,000 kronor to pay off old debts and write off bad investments, which would make the government's financial position sounder than it had been at the end of the previous boom in 1930.

In the four years between 1934 and 1938, government revenue from the income and estate taxes went up by 55%. A cut in income tax rates of close to 12% had been made in 1936, and since both the size and the number of taxable incomes had gone up by 1937, further cuts seemed unnecessary. In 1932, a new type of budget had been adopted, one that would be underbalanced in lean years and overbalanced in the fat ones.

Surpluses were to be put into a special equalization account, the use of which was defined in the king's address from the throne on Jan. 11, 1938.

"Our country can continue to rejoice over a favorable economic situation," said his majesty. "Neither is there any reason for expecting any change due to purely domestic causes." (On the eve of the Munich crisis he wisely hedged on foreign ones.) "But because of the decrease in economic activity in other countries with which we are closely connected in business," he went on, "the future is uncertain. Caution based on earlier experiences bids us not to meet it unprepared. Evidence of increased strength in our own private industrial enterprises is not lacking. It is my hope

that this will be utilized in keeping up employment, even during an eventual future crisis. The government, too, must be prepared to act more quickly than it has done heretofore. At the first signs of depression, it must take measures to maintain employment and support the people's purchasing power. For this reason I intend to submit to you an economic preparedness budget which will take effect if and when an unfavorable development demands it."

This idea of an economic preparedness budget to fight depressions had to be abandoned, however, as the international situation grew worse. What Sweden had to achieve when Hitler had annexed both Austria and Czechoslovakia was a military preparedness budget rather than measures to combat unemployment, the chief obstacle of the 1930s. Prior to 1936, the annual national defense budget had been but 125,000,000 kronor, but by 1936-37 it had reached 154,000,000; in 1937-38, 179,000,000; in 1938-39, 262,000,000; in 1939-40, 320,000,000, later increased to 1,350,000,000; figures that clearly reflected the growing Swedish apprehensiveness over the international situation. During the war years, the military appropriations averaged 2,000,000,000 kronor, or 16 times the 1936 figure. No other small country in Europe spent that much money for its national defense.

Traditionally, the Swedish Social Democrats, like their fellow partisans in other countries, had been internationalists and strongly antimilitaristic. In 1925, they had supported the Liberals in reducing the Swedish army by about one-third, and in 1932 they naturally put social welfare and economic recovery before national defense. Hitler had just then come to power in Germany. As late as 1936 they resigned on a social welfare measure and thereby avoided the issue of voting for a proposed increase of less than 25,000,000 kronor in the military appropriations, as pro-

posed by a mixed partisan commission.

By Jan. 1938, the original appropriations asked for national defense by the Hansson government had gone up to 180,560,000 kronor, but by March that year, when Hitler had annexed Austria, Hansson asked for 50,000,000 extra. He had seen the significance of the Hitler move. "The extra measures contemplated," he told the riksdag, "are of such a nature that they will have immediate effect." Without debate and without a dissenting vote, the money was granted. This was the first real Swedish emergency measure to prepare for World War II.

The spirit of national unity with which the Swedish people were later to face the war itself had by then taken firm root. The Social Democrats had faced the necessity of giving increased support to the national defense, just as the bourgeois parties had previously accepted the labour program of improved social welfare. Throughout the 1930s there were virtually no party differences of opinion in regard to foreign policy. All groups had supported the League of Nations, whereas there had been bitter disputes as to foreign relations before, during and after World War I.

As the 1938 riksdag opened, there was even less opposition to the Social Democratic government's proposals than there had been in 1937. If there was no tax reduction promised, there were also no new and expensive social welfare measures proposed either. This reform pause was intended to give the taxpayers a breathing spell. Even after the increased military expenditures had been voted, the expected government income was large enough to balance the 1938–39 budget without new imposts. As the foreign situation grew worse, domestic political strife died down.

The Shock of Munich.—Into this Swedish social welfare idyll of 1938 the Munich crisis broke as an unpleasant surprise.

What had Sweden done to prepare for it? In World War I, the nation had been neutral, though less united mentally than in the 1930s and 1940s. It had joined the League of Nations only after a sharp debate, but throughout its life had loyally fulfilled all obligations. Sweden had been the first neutral country elected to a seat on the League council, and it continued to be a sort of informal leader of the neutral bloc. In order to sustain the new international system, Hjalmar Branting had induced his country to accept gracefully, in 1921, the unfavourable decision of the League in regard to the Aland Islands, which were awarded to Finland. In 1925, after the Locarno agreements, Sweden had partly disarmed unilaterally, believing as it did in the new collective security. In 1935 it had taken part in economic sanctions against Italy, but had lived to regret that too; the great powers had not been sincere in their participation; the oil embargo which might have been effective was never imposed, and both France and Britain were suspected of having given Mussolini permission to proceed with his Ethiopian conquest. In 1937, the Swedish foreign minister, Richard I. Sandler, made a round of the European capitals, except Berlin and Rome, to get advance consent for a move at the next League meeting to be absolved of future obligation to take part in economic sanctions. (Sweden had made a reservation against participating in military sanctions before entering the League.) At the 1938 session, as a matter of fact, several states gave formal notice that they would never again take part in economic sanctions. To the very end Sweden kept up its membership in the League, hoping for the

miracle that never was performed, but at the same time prepared for a resumption of its old neutrality policy.

During the final peace year, Sweden's main concern was to avoid affiliation with one group or the other of the great powers. It liked neither the Fascist nor the Communist camps, and the democratic powers were geographically too far away. After the Russo-German nonaggression treaty in Aug. 1939, which set off the war, there was less choice than ever.

As early as 1930, Sweden had become a member of the so-called Oslo group of small powers which had met in the Norwegian capital to discuss economic disamament. The member nations had been able only to promise not to raise their import duties without first giving each other due notice—a modest enough commitment. This was the Furo pean small power answer, feeble as it was, to the British empire agreement about preferential duties, which in turn was a result of the U.S. tariff increases during the Herbert Hoover administration. To this vicious circle there was no end. Beside Sweden, the members of the Oslo group were Belgium, Denmark, Finland, the Netherlands, Norway, and Luxembourg (the members of the neutral bloc in the League of Nations, with Belgium taking the place of Switzerland).

Besides resumption of neutrality, Foreign Minister Sandler discussed on his travels in 1937 the idea of enlarging the Oslo convention. In July, when he visited Moscow, he was dined by Foreign Commissar Maxim Litymov and was received cordially by Soviet President Mikhail I. Kalinin, but he did not meet Joseph Stalin and there were no visible results. The Oslo powers could not have formed a military alliance. They could not even plan a customs union. While their total foreign trade was comparable in volume to that of several of the great powers, their total trade with each other was less than that with almost any one of the big nations. As long as the latter were divided, they were helpless.

Equally futile were the attempts before the war to create some sort of Scandinavian unity. In foreign trade, even population, these states if united might have seemed impressive; but they had no geographic unity and therefore no common military front. While united mentally and in ideals of civilization, they could apply no common strategy. It would have been as hard, for instance, to get Finland to help hold the southern Danish frontier against Germany as to make either Norway or Denmark mobilize to defend Finland against Russia. Only Sweden, situated as it was, in the centre, was a common denominator. The Danes felt that it would be both foolish and lutile for them to provoke Germany by rearming. They did not want, they said in effect, to make the Germans fear that their country might be used as a jumping off place by a would-be enemy of the reich. Norway seemed safe as long as it had Sweden as a buffer to the east and the British navy controlling the seas to the west. Neither of these countries therefore followed Sweden's example of at least beginning to rearm in 1936.

Only in Finland did Sweden get a favourable response. Early in 1938 a Stockholm pact was drawn up, providing for a joint defense of the Aland Islands, but it was never ratified by the Swedish riksdag, or even submitted to the other interested powers, signers of the 1921 Aland convention, by which the islands were to be demilitarized. Finland had stayed better armed than Sweden and in spirit it had not broken training, either mentally or physically, since World War I. Sooner or later it expected to be attacked by Russia, as happened at the end of Nov. 1939.

Sweden and the Finnish War.-Feeling itself menaced

too, Sweden at once sent both food and munitions, especially planes and anti-aircraft guns, medical aid and supplies, and later fully armed volunteers. Under the League of Nations' ruling that Finland had been unjustly attacked, this was not only legal but a neighbourly duty. In this war Sweden did not declare itself a neutral, but a nonbelligerent, or informally a noninterventionist. Many other countries, including Norway and Denmark as well as France and Britain, sent volunteers via Sweden, and some sent machine guns and artillery pieces, antiquated as some of them were. Almost all over the world Sweden was then berated for not taking an official and more active part. Inside Sweden, too, feeling ran high. "Finland's cause is our own," was the watchword, launched by Christian E. Guenther, the new nonpolitical foreign minister himself. Russia seemed to have no friends anywhere except the Communists in various countries.

On Feb. 13, 1940, Finland made a formal request for official aid from Sweden, but this was refused, causing Swedish public opinion to become even more aroused. The explanation given by the prime minister, Per Albin Hansson, on Feb. 15, was rather curt, and to allay the widespread excitement and disappointment, the king himself dictated a personal statement to the cabinet minutes (Feb. 19) which was at once published—a form of expression of opinion left open to him even after the adoption of the parliamentary system. In this he said, "From the very beginning Sweden has tried to aid Finland by means of volunteers and in numerous other ways, but at the very start I informed the Finnish authorities that, unfortunately, no military intervention could be expected from Sweden. With sorrow in my heart I have come to the conclusion, after serious reconsideration, that to this decision we must hold fast. For I am definitely of the opinion that if Sweden were now to intervene in Finland, we would run the greatest risk of not only becoming involved in a war with Russia, but also in the war between the great powers, and such a responsibility I am not able to assume. In such a situation, moreover, it would most probably be impossible to continue to render the not inconsiderable aid which Finland now receives from us and which it so well needs and which we are prepared to continue to give with the warmest of hearts. Sweden's vital interests, its honor, and its peace are the aims I have ever in mind. With the help of God, I hope that by following the route we have chosen we shall be able to escape all the misfortunes of war." With this conclusion the Swedish people as a whole agreed, and the demand for official aid died down.

On March 2, 1940, the Allied powers, France and Britain, made a formal request for the right to send troops across Scandinavia to aid Finland, if Finland should make such a request, which, as a matter of fact it never did; it was then too late. Both Norway and Sweden, however, replied in the negative. At least the Swedish government knew that as early as January Finland had requested, via Sweden, peace terms from Russia; and on March 12, or before any military help could have reached the north from either France or Britain, a peace treaty was signed in Moscow.

For the time being, the danger of being involved in the general European war was averted. Had the Allied request been granted, the risk of both France and Britain getting into a war with Russia would, of course, have been great. Had that happened, and had Hitler and Stalin thus been forced to become permanent partners, the outcome of World War II could very well have run a different course. The negative Norwegian and Swedish decision in

March 1940 could therefore be termed a crucial turning point. During the "sitzkrieg" period on the eastern front in France in 1939–40, the opening of the northern front in Scandinavia against Germany had been openly discussed in the Paris press. On such a front Britain would have been, of course, expected to bear the major burden, a repetition of similar French agitation in World War I, when the French wanted the British to take over more of the line in northern France.

That the real objective of the Allies was less to aid Finland than to get control of the Swedish iron mines in arctic Lapland was suspected by both Norway and Sweden. The secret minutes of the Allied Supreme council on this point were later published in England and Sweden as well as in Germany.

The German Thrust North.-What would have happened had the Allied troops invaded or been admitted to the north was shown on April 9, 1940, when Germany carried out its own long-planned scheme to occupy both Denmark and Norway, the immediate excuse being that the British navy had mined certain Norwegian coastal waters in order to stop the transport of the Swedish iron ore to Germany. Germany already had charged that the Allies themselves had planned to invade Scandinavia. At the Nuernberg trials it was shown that they had planned the coup as early as the preceding fall and that they actually hoped for an Allied move in the north to give them an excuse to act. As a matter of fact, the Allies made no such move; they only talked about one, and the Germans took them by surprise. Thanks to its contacts inside Germany, Sweden had at least two weeks' advance warning, which it passed on to both Denmark and Norway. When asked about this, German diplomats deceived the Scandinavian governments by replying that their "operation Weser" was intended for the Low Countries.

Having learned that the Allies had made preparations themselves for action in the north, Sweden naturally assumed, in April 1940, that they were prepared to counter the German stroke. The ultimate German objective was after all not Norway, but Great Britain. By its help to Finland, Sweden, moreover, had badly depleted its inadequate supply of munitions, and Germany made the direct threat that under all circumstances it expected Sweden to maintain its declared policy of neutrality. Without relying on Germany's promise to leave Sweden alone as long as the latter did not interfere with German plans elsewhere, Sweden at once mobilized as never before in its whole history. Several German military scouting planes were shot down, and a complete blackout was ordered. Even the seacoast beacons were put out. Requests for the purchase of arms from Norway were turned down, as were the German demands for the right to send troops through Sweden to relieve their hard pressed units at Narvik. Later in the spring several German medical shipments and nursing staffs were allowed to pass through Sweden, and both German and British crew members of the civilian ships sunk at Narvik were evacuated through Sweden. Otherwise, while mounting guard over its own frontiers, Sweden kept inactive. Repeated German requests for troop transit privileges through Sweden were refused; each time Sweden expected to be invaded the next night or early the next morning. Finally in June the tension was eased by the Allied withdrawal from Norway and the escape of the Norwegian king and government to England. For the time being, open Norwegian resistance seemed broken.

Why did Sweden escape? At that time its military estab-

lishment was so weak that it could not have offered serious or long-drawn-out opposition to the immense German strength. Nor could the Allies have given Sweden the help they could not render even to the more accessible Norway. In the international political situation of the time Russia's attitude was obviously most important to Germany. The feeling in Finland being what it was after the bitter defeat earlier in the year, Russia must have known that if Germany had occupied the whole of Scandinavia, including Sweden, the balance of power between the two great Baltic states, Germany and Russia, would have been upset. As long as Sweden stayed neutral, there was no plausible reason Germany could give Russia for an occupation. From Moscow came reports that the German ambassador had spent five hours in the Kremlin, presumably to explain his country's intentions. Denmark was but a stepping stone to Norway, he probably pointed out, and the Norwegian coast was to be used for submarine action or even as a starting point for an invasion of England. That such was the German policy was confirmed at Nuernberg. Conversely, the occupation by Germany was intended to forestall one by the Allies, he probably told the Russians. Mountainous Norway was to be only a temporary German rampart to the north-an easily defended bastion. No such excuse could have been offered for invading a neutral Sweden. Sweden, to be sure, was an important Baltic state, the continuation of whose neutrality was a Russian concern. By occupying it, Germany would have outflanked Russia to the north, especially as Finland had not been occupied. Whatever the Russian rulers replied to the German ambassador, Sweden understood what had happened and at once sent a note of appreciation to Moscow, an act that was not officially revealed until after Germany had been defeated, when it attracted little notice, except in Sweden. Internationally, Russia's attitude was indirectly revealed at the time in a Tass news agency dispatch from Moscow which first denied certain not otherwise identified foreign press reports that Russia had put pressure on Germany in favour of Swedish neutrality, and then emphasized the desirability from the Russian point of view of a continuation of that very policy. Germany at that time knew that it must avoid a break with Russia at all costs. The western front was still intact.

How worried Germany had been that Sweden might join the Allies was revealed at the Nurnberg trial, explaining at last the announcement in Berlin on May 7, 1940, that Hitler and King Gustavus of Sweden had been in correspondence, and that the king had given Hitler his personal word that his country would remain neutral—a correspondence that was soon confirmed by the Stockholm foreign office. Against this background, the apparently uncalled for statement by the German foreign minister, Joachim von Ribbentrop, on April 26, 1940, that Sweden's neutrality had been perfect and was expected to remain so, took on a clear meaning. By indirection, Russia was thereby assured that Germany intended to leave Sweden alone. Diplomats often talk around curves.

Aside from this fear of provoking Russia, Germany had other, more direct reasons for its restraint. By leaving Sweden unoccupied, it felt, it could count on a continued exchange of goods, and since all transoceanic trade routes had been blocked by Britain every source of supply, no matter how small, was valuable. Of particular interest was Sweden's iron ore; to keep that source open, Germany was willing to ship coal to Sweden in return. And since Sweden had lost its coal supplies in both Poland

Log piles along the streets of a Stockholm suburb where wood was used as home fuel during the wartime coal shortage in Sweden.

Available supplies of coal were reserved for industrial uses

and Britain, there was only Germany left. Swedish pulp and paper were less important, though worth buying at a certain price. Sweden also needed German chemicals, especially those used in medicines and commercial fertilizers. In return, Germany could demand ball bearings and other types of steel. And once Sweden was surrounded by German military power there was every reason to believe that ultimately it could be induced to join the German "lebensraum" without the expenditure of a single shell or air bomb. Finally, when the planned big drive against Russia was started, Sweden, like Finland, could be expected to join in the "crusade against bolshevism." That Sweden instead continued to rearm, resisting as many German demands as possible, and finally refusing point blank to march against Russia, was, of course, a disappointment. The German press then began to call the Swedes names such as "Communists," "a people on vacation," "a nation out of step with the times," and finally "swine in tuxedos"-a typical German nerve war.

When World War II began, Sweden had attempted to carry on normal trade with both England and Germany and in Dec. 1939 concluded special treaties to that effect with each of those powers. When Sweden was surrounded in 1940 and lost about 70% of its foreign trade, chiefly from overseas, it had no choice but to increase its trade with Germany and the countries the latter had invaded and conquered. For several years before the war Swedish

trade with Germany had been conducted on the barter or forced clearing basis; this system was continued throughout the war.

German coal was traded for Swedish iron ore; chemicals and rubber for ball bearings. At no time during the war did Sweden send Germany either foodstuffs or readymade arms or munitions. In the fall of 1944, all trade stopped. Throughout the war and despite German blockade, Sweden managed to send Britain ball bearings too, but that could not be revealed until later. With Russia, Sweden concluded a wartime trade treaty in Sept. 1940, granting credits up to 100,000,000 kronor, but the trade that started then was cut off in June 1941 when Germany invaded its associate of 1939.

Under heavy German pressure, a major concession was made by Sweden early in July 1940, after the Low Countries had been overrun and France had capitulated. Sweden consented to allow German soldiers on leave to travel on Swedish trains from Norway to the German border and vice versa, and a certain number of armed men were permitted to use the Swedish railroads between points in northern and central Norway, between which there was no train service within Norway itself. German munitions were also routed through Sweden, both to Norway and Finland, a concession balanced by the charter in 1940 of one-third of the Swedish merchant marine to England for service in the convoyed transportation of both food and munitions to England. Many of these ships were torpedoed and lost. A year later, after the German war against Russia had started, Sweden agreed to transport a single German division from Norway to Finland, a favour requested by Finland as well as Germany.

Neutrality?-While the second concession was clearly a violation of neutrality, the first was a border case, partly mitigated by the fact that when it was granted, open resistance had ceased in Norway (the underground movement had not yet been formed) and that it was not in direct violation of any distinct provision in the 1907 Hague rules of neutrality-a technicality, to be sure, but still arguable. To the worried Swedish people, who had heard rumours and read newspaper reports of German soldiers on Swedish trains, the foreign office, on July 5, 1940, issued the following statement: "Since the military operations in Norway have been discontinued, the war restrictions on transit to and from Norway have become superfluous. All goods in such traffic may therefore now be transported on the Swedish railroads. Travel permission will also be given to members of the German military forces, especially soldiers on leave. For this purpose special cars will be provided." To say that the Swedish public was both bewildered and shocked would be an understatement. The Norwegian reaction was naturally even more profound. To both countries it was a painful situation.

In a public address delivered at Ludvika in central Sweden two days later, July 7, 1940, Prime Minister Hansson explained as follows: "During the war in Norway, the transit traffic was restricted and shipments through Sweden of both men and munitions was refused to both sides in the conflict. The situation has now changed. From our point of view the dominating fact is that fighting between Germany and Norway has now ceased and that the whole European situation has thoroughly changed during the past two weeks. Obviously, Sweden cannot ignore the fact that seven European countries have been occupied by Germany, either wholly or in part, and that France has accepted an armistice. Our government's main duty is to keep Sweden out of the war and safeguard our freedom and independence. Neutrality and national

emergency measures are the instruments used in our efforts to save our country from war."

While there was much grumbling and criticism, this policy was ultimately supported by all parties in the national coalition cabinet. In September of that year the Social Democratic representatives were given a clear majority, 134 out of 230 seats. As attendance at the polls was about the same as in 1936, this verdict was a distinct personal triumph for Hansson and his policy.

The concession permitting a German division to cross Sweden from Norway to Finland a year later was explained by Hansson in an address at Uppsala on June 29, 1941, in which he said, "There is no occasion to conceal that this accommodation caused much hesitation, particularly in view, among other things, that it involves a deviation from the traditional concept of neutrality and that it has put a strain on the national unity. The consent was given only after careful consideration. . . . Let what has happened be what it is—an accommodation, a single concession which to be sure is of great importance, but at the same time clearly limited in scope."

The German division, which after crossing Sweden was expected to reach Murmansk and otherwise hold the extreme left wing of the German-Finnish lines, never gained its objective. Repeatedly Germany made requests for further transit concessions over the Swedish railroads, but was consistently turned down. What Germany had expected to be the beginning of Swedish accommodations, turned out to be, as announced, the last one. On that Sweden was united. In the fall of 1943, even the special permits for traffic to Norway were cancelled, ostensibly by mutual consent. Germany was then too weak to bluster in the 1940 fashion, while conversely, Sweden had made much progress in rearming.

Toward the end of the war, Swedish officers were allowed to train in Sweden young refugees from both Denmark and Norway, supposedly for police duty in their own respective countries when the Germans should withdraw, and many young Norwegians were allowed to leave by air for training in England or overseas. American air pilots who had made emergency landings in Sweden after missions over Germany were allowed to leave the country on a credit basis, the Germans being told that whenever a corresponding number of their pilots had made similar landings in Sweden they too would be repatriated. By then, however, the power of the German luftwaffe was exhausted. In the very last stages of German resistance, Sweden sent a caravan of motor buses to Germany under the command of Count Folke Bernadotte, a nephew of the king, to evacuate first the Scandinavian inmates and then as many as possible of other nationalities from the German concentration camps. Nearly 20,000 civilian prisoners of the nazis were thus brought to Sweden and helped to recuperate. The total number of war refugees in Sweden at various times and from various countries was almost 200,000, Finnish war orphans being the most numerous.

Postwar.—When the hostilities ceased, Sweden was naturally in a position to start production at once, its machinery and factories being largely intact. Prefabricated houses were delivered to England, the Netherlands and other war-torn areas, including the Danish island of Bornholm. The demand for goods of all kinds became very strong and to many countries Sweden sold goods on credit, particularly its neighbours, Denmark, Finland and Norway. The credit limit to Britain itself was set as high as 600,000,000 kronor. On a cash basis, trade with the U.S. was resumed

Swimming

The major developments in swimming during the decade 1937–46 were the vigorous impetus imparted to educational activities by the exigencies of World War II, the unprecedented role played by expert swimmers in actual combat, and the notable strides made in lifesaving methods, speed swimming and fancy diving.

In the early stages of the war, lack of watermanship among service men was responsible for loss of life so appalling in ship sinkings and landing operations that all belligerents came to realize the imperative need of taking immediate steps to remedy the shortcoming. Teaching centres were organized rapidly, in ever increasing numbers, and eventually millions of men and women were taught to swim, thus materially reducing the world's quota of

non-swimmers and bringing about almost universal recognition of the value of swimming in lifesaving and physical development.

At these centres, too, far more efficient methods of selfprotection in accidents at sea were evolved, as well as new and greatly improved techniques for the use of swimming in the rehabilitation of injured veterans and the treatment of infantile paralysis.

Here also, various service groups were trained for particular combat duties, including the famous Allied underwater demolition teams, whose task it was to blast the way for invasion and who acquitted themselves valiantly and conspicuously on the Normandy beaches, in the Mediterranean and throughout the Pacific. Never before had swimming been utilized so widely and effectively in war-lare.

Water sports, meanwhile, were fostered for recreation and conditioning at the training centres and at the front, proving immensely popular and of great benefit. Allied championships were conducted in the various theatres of operations and results were successful everywhere.

Records.—The great slashes administered to world's records during the decade bore witness to the progress of speed swimming. Only eight of those established prior to 1937 remained unbroken, five of them marks for events never used in international competition.

A highlight was the downfall of the most enduring record on the official table, that of 51 sec. for the 100 yd. free style, created in 1927 by John Weissmuller, of the United States.

Sixteen years had elapsed when his young countryman, Alan Ford, clipped the record to 50.6 sec., then to 49.7 sec. in 1944.

The greatest star of the decade, however, unquestionably was Ragnhild Hveger, of Denmark, who rose to fame in 1936 and dominated the field until her retirement in 1944. She shattered all but one of the 16 free style records listed for women, several repeatedly, some by large total margins, cutting the time for 220 yd. from 2 min. 27.6 sec. to 2 min. 22.6 sec., 400 m. from 5 min. 12.4 sec. to 5 min. 1 sec. and 1,500 m. from 22 min. 36.7 sec. to 20 min. 57 sec. Thirteen of her free style records remained unbeaten, as did that of 5 min. 38.2 sec. for the 400 m. back stroke.

The only other swimmer to monopolize records throughout the period was Adolph Kiefer, United States back stroke ace, who also retired. True, one of his marks was shaded, but he disposed of the claimed record before it could be bracketed. In all, he sliced the figures for 100 yd. from 58.8 sec. to 56.6 sec., 200 m. from 2 min. 24 sec. to 2 min. 19.3 sec. and 400 m. from 5 min. 13 sec. to 5 min. 10.9 sec.

The decade opened rather dully, a natural reaction to the feverish activity caused by the Olympic games of 1936 in Berlin. Aside from the exploits of Miss Hveger and Kiefer, the only record broken was that of 20 min. 57 sec. for one mile free style, dropped to 20 min. 42.6 sec. by Ralph Flanagan, of the United States.

Things again were in full swing by 1938 and the British Empire games in Sydney provided the highlight. Australia and England fought so keen a battle for aquatic laurels that third places had to be figured before Australia could be declared the winner. Tomikatsu Amano of Japan earned glory by ripping the 11-year-old record for 1,500 m. free style from 19 min. 7.2 sec. to 18 min. 58.8 sec.; a Dutch lass, I. Van Feggelen, leaped into the spotlight, erasing all four of the back stroke standards tabled for women and doing her best at 100 m. in 1 min. 12.9 sec. and 400 m. in 5 min. 41.6 sec.; Flanagan added to his holdings a mark of 4 min. 46.2 sec. for 400 m. free style.

The European championships brought a startling upset, the favoured Dutch naiads suffering a crushing 100-to-60 defeat at the hands of their Danish rivals.

Two topnotch breast stroke swimmers stepped to the fore in 1939, Richard Hough, of the United States, lowering the records for 100 yd. to 1 min. .6 sec. and 100 m. to 1 min. 7.2 sec., Inge Sorensen, of Denmark, the women's for 400 m. to 6 min. 16.2 sec. and 500 m. to 7 min. 58 sec. Of especial interest were the first victory ever gained by a Hawaiian team in the men's championships of the U.S.A.

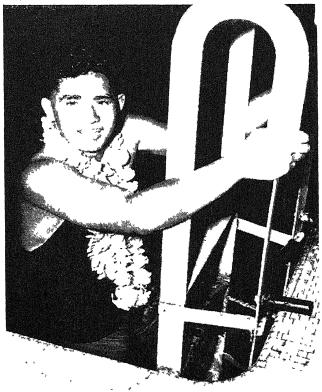

and the success of the German men and Danish women in the European title tests, the last of the decade, held almost on the eve of the war. The start of hostilities made it necessary for the Fédération Internationale de Natation Amateur, controlling body in Olympic and international water sports, to suspend operations. It did not resume its functions until 1946.

Of chief import in 1940 was the noticeable decline of Japan's men swimmers, claimants to world leadership from 1932. In their national championships they fell short of the winning performances of 1939 in every event, except the 100 m. back stroke. All sports were curtailed in wartorn Europe, and most of the title events were abandoned for the duration, but one record fell, Miss J. Waalberg of Holland clipping the time for 500 m. breast stroke to 7 min. 49.9 sec. In the United States the standards for the 400 yd. and 400 m. relays were lowered to 3 min. 30.7 sec. and 3 min. 54.4 sec.

The discovery of a 16-year-old Hawaiian then rated the greatest middle distance swimmer of all time was paramount in 1941. William Smith, Jr., the lad in question, displayed sensational speed in slashing free style records from 220 yd. to 800 m. In particular, he swam the 800 m. in 9 min. 50.8 sec. in a 100 m. pool, time which, allowing for the gain at the turns, was equal to about 9 min. 43 sec. in a 50 m. pool, the length of course over which the former record of 9 min. 55.8 sec. was set. The standard for the 400 yd. relay was bettered thrice in the U.S.A., finally dropping to 3 min. 27.7 sec.; and Alfred Nakache of France shaved the time for 200 m. breast stroke to 2 min. 36.8 sec.

Smith continued to write swimming history in 1942; his

William Smith, 16-year-old Hawaiian swimmer, after he had set a new world's record of 2:07.7 for the 220-yd. free style at Honolulu, May 16, 1941. In one week he established five new world's records

outstanding feat was to cover 440 yd. in 4 min. 39.6 sec. in a 55 yd. pool, an approximate pace of 4 min. 29 sec. in a 25 yd. pool, the course used in creating the then tabled mark of 4 min. 40.8 sec. Hiroshi Nakama, another Hawaiian, cut the figures for one mile to 20 min. 29 sec. and a U.S.A. four cut those for the 400 m. relay to 3 min. 50.8 sec.

Of especial interest in 1943 was the mentioned threat to the back stroke supremacy of Kiefer. Harry Holiday, his fellow citizen, not only lowered the record for 100 yd. to 57 sec., but nosed out the noted ace in the national 150 yd. championship. But Kiefer soon regained standard and title. Danish girls hung up a new record of 4 min. 5.7 sec. for the 400 yd. relay; Alfred Nakache further reduced the time for the 200 m. breast stroke to 2 min. 36.4 sec. and Leonid Meshkov of Russia was credited with a mark of 5 min. 43 8 sec. for the 400 m. breast stroke, but feats by

Ann Curtis (left), 100-yd. titleholder in 1945, with Brenda Helser, whom she defeated during the A.A.U. indoor swimming meet at Chicago, III., on April 13

Russians could not be recognized, because the soviet union was not affiliated with the F I.N.A.

Ann Curtis of the United States made a strong bid in 1944 for the post vacated by the retiring Miss Hveger. Besides shading the latter's record for 880 yd. to 2 min. 8 6 sec., she came close to other marks and won the U.S. titles from 100 m. to one mile free style. Alan Ford clipped the standard for 100 m. free style from 56.4 sec. to 55.9 sec. and William Smith those for 200 m. and 220 yd. to 2 min 6.2 sec. and 2 min. 7.1 sec., while a U.S.A. four cut the time for the 400 yd. relay to 3 min. 24.5 sec.

Joseph Verdeur of the United States was the only record breaker in 1945, with 2 min. 21 sec. for the 200 yd. breast stroke, but Miss Brenda Helser, same country, swam 100 yd. in 60 sec. and the 100 m. free style in 1 min. 58 sec over a 50 m. course, better performances, figuring the gain at the turns, than the records of 59.4 sec. and 1 min. 16 sec., set in 25 m. pools. Two boys of striking ability drew attention as world prospects, James McLane of the United States, 14 years old, and Alex Jany, of France, 16. McLane won the national one and three mile titles over Nakama one-mile record holder, and Jany achieved 57 5 sec. for 100 m. and 2 min. 9.8 sec. for 200 m., not far from standard time.

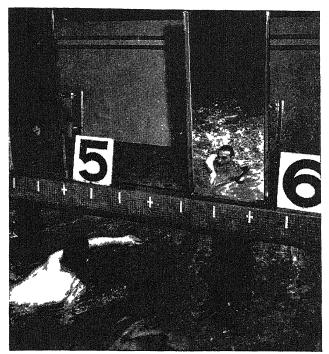

Outstanding in 1946 were a great revival of water sports in Europe and the return to activity of the F.I.N \(\). A number of abandoned title meets were resumed in Furope, intercountry matches were frequent and brilliant perform ances marked the competition. The F.I.N.\(\). executive bureau held its first postwar session in London in June, revised its rules, drafted plans for the Olympic games of 1948 and approved 45 of the records set while it was inoperative. H. E. Fern, of England, was elected president, and R. M. Ritter, of the United States, secretary-treasurer.

Jany fulfilled predictions made for him, clipping the record for the 200 m. free style to 2 min. 5.4 sec., besides helping lower the time for the 300 m. medley relay to 3 min. 12.3 sec. McLane showed great improvement, winning national titles from 400 to 1,500 m. and defeating at 400 m. Smith, the record holder. Miss Nel van Vliet, of Holland, assumed front rank as a breast stroke star, breaking six records and slashing these for 200 m. from 2 min 56 sec. to 2 min. 52.6 sec., and 500 m. from 7 min. 49.9 sec to 7 min. 41 sec. while Joseph Verdeur dropped the men's for 200 yd. and 200 m. to 2 min. 19 5 sec. and 2 min. 35.6 sec. Russia's Leonid Meshkov was credited with an unofficial record of 1 min. 5.2 sec. for 100 m. breast stroke

In glancing over the picture of the decade as a whole, there was evidence aplenty that the Japanese had lost in 1940 any claim they may have had to international leadership in swimming for men and that the United States was in front after that. Among women, the Danish succeeded the Dutch in 1938, retaining the lead until Miss Hveger retired.

Supremacy in fancy diving was maintained throughout by the men and women of the U.S.A., and it was a gauge of the men's margin of superiority that they introduced quite a few new and more difficult dives. Some added to the official table at the highest valuations ever listed. The ablest performers were, chronologically, Al Patnik, Earl Clark, Sam Lee, Frank Dempsey, Norman Sper, Jr., Miller Anderson, Bruce Harlan and the Misses Arlite Smith, Marjorie Gestring, Helen Crlenkovich, Ann Ross and Zoe Ann Olsen.

Water polo grew steadily in popularity, and although the war broke up standardized competition, it did not greatly reduce activity, as the game was played extensively at training centres and in the war theatres. Hungary was

Alan Ford, of Yale university, New Haven, Conn., who broke a 16year swimming record when he swam the 100-yard free style in 50.6 seconds. He is shown using a mirror to detect flaws in his stroke during a practice swim

foremost in 1937 and 1938, lost to Germany in 1939 and regained the top in 1940, when the last determining matches took place. Results in 1946, with Hungary, Germany and England not participating, placed Sweden at the head of the list.

Switzerland

A republican confederation of 22 cantons in west-central Europe, Switzerland is bounded N. and E. by Germany, S. by Italy and W. by France. Area, 15,944 sq.mi.; pop. (census of Dec. 1, 1941,) 4,260,179. Chief towns: Berne (cap. 129,331); Zürich (333,829); Basle (161,380); Geneva (124,442); Lausanne (91,738). Languages (census of 1930): German 2,924,314; French 831,100; Italian 242,034; Romansch 44,204 and others 24,797. Religion: Protestant 57%, mainly in the more populous cantons of Zürich, Berne, Vaud, Neuchâtel and Basle; Roman Catholic 41%, mainly in Lucerne, Fribourg, Ticino, Valais and the Forest cantons; Jews and others 2%.

The Swiss federal constitution, adopted in 1874, provided for a parliament and federal council. The parliament is the supreme legislative authority and consists of two houses: a Standerat, or council of states of 44 members, 2 chosen by each canton by varying methods; and a nationalrat, or national council, chosen by the Swiss people in direct election for 4 years, at the rate of one deputy for every 22,000 persons; in 1937, there were 187

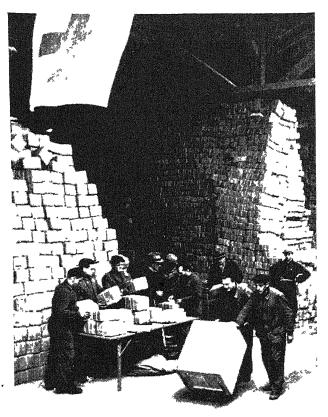

deputies and in 1946, 194. Laws passed by the two houses can be vetoed by the people, which means in effect that 30,000 citizens, or eight cantons, may demand that the law in question should be submitted to the direct vote of the nation, which can say only "yes" or "no." This referendum procedure is frequently used.

The chief executive authority is deputed to the bundesrat or federal council, consisting of seven members, elected for four years by the two houses of parliament sitting together as a federal assembly. The president of the Swiss confederation and the vice-president of the federal council are also both elected by the federal assembly for the term of one year from Jan. 1 to Dec. 31 and are not re-eligible to the same offices until after the expiration of another year. The vice-president may be, and usually is, elected to succeed the outgoing president. The presidents for 1937-46 were: Giuseppe Motta (1937), Johannes Baumann (1938), Philippe Etter (1939), Marcel Pilet-Golaz (1940), Ernest Wetter (1941), Philippe Etter (1942), Enrico Celio (1943), Walter Stampfli (1944), Eduard von Steiger (1945) and Karl Kobelt (1946). (S. B. F.)

Traditional Neutrality.—In joining the League of Nations in 1920, Switzerland had accepted the obligations of membership with one reservation, which safeguarded its military neutrality. Such prudence was amply motivated by the political uncertainty left by the treaty of Versailles. As the impotence of the League became increasingly evident, Switzerland was permitted in 1938 to resume its traditional, unconditional neutrality. It remained a member of the League but was freed from all obligations to participate in any kind of sanctions.

World War II did not impair the political neutrality of Switzerland. This was chiefly because of the firm attitude of the Swiss people who, under the leadership of the sederal council and of Gen. Henri Guisan, were determined to defend themselves to the utmost, and also to the fact that vital military decisions were reached away from the Swiss borders. As long as Switzerland had two belligerents along its frontiers, its troops remained ready for action on all sides. Later, when the country was surrounded by axis forces only, the Swiss organized their national redoubt in the heart of their mountains, ready to abandon the lowlands and towns in order to make the decisive stand in their natural fortress.

It is true that in order to survive materially and, especially, to receive the coal supply so indispensable to its industries, Switzerland was forced into commercial agreements that operated in favour of the axis. It is true also that the liberty of the press had to be restricted through censorship. But at no time did it compromise on the fundamentals of its neutrality. On the other hand, the influx of an increasing number of refugees and escapees raised many grave problems. Although improvisation was often necessary, the helping spirit of the Swiss remained true to itself. The doors were opened to children suffering from hunger and privation. Thanks to the activity of the International committee of the Red Cross, Switzerland became the centre, during the war, for the assembly and forwarding of prisoner-of-war parcels and messages, and following the end of hostilities in Europe for the dispatch of relief supplies to distressed populations. The postwar welfare agency created by the Swiss themselves was called the Don Suisse. Its activities were first directed toward countries to the west of Switzerland, then south, north and east. The Don Suisse collaborated on many occasions with the United Nations Relief and

Rehabilitation administration and was the best illustration of the way the Swiss people intended to contribute, within their limited means, to the reconstruction of Europe.

The creation of the United Nations again brought the problem of neutrality to the fore again. No final decision had yet been taken at the end of the decade 1937–46 regarding the position of Switzerland in the new world organization, but it should be stressed that if Switzerland wished to preserve its neutrality it was precisely in order to go on rendering services so urgently needed in times of conflict. Indeed, one of the most valuable contributions which Switzerland was able to make during the war was the part it played as a protective power.

Internal Policy.—Independent development in Swiss internal policy could occur only under the protective shield of neutrality. This does not mean that Switzerland had not been influenced by the various European political currents. There, as in almost every other country, socialism had made steady progress. Aware of the economic implications of the new program, the conservatives joined hands. And while the socialists looked to soviet Russia as the one state having come closest to the realization of their ideals, the bourgeois parties at first regarded without displeasure the façade of order that the first fascist government was building in Europe. The arrival of the nazis on the political scene, however, was the danger signal to all Swiss patriots.

After World War I, party politics gradually yielded to the growing influence of economic interests. By the end of the decade 1937-46, it was mostly the trade unions,

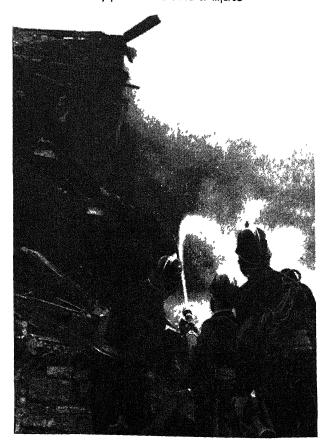

the employers associations, the industrial groups which were determining the fate of the country. In 1943, a Socialist, Einest Nobs, was elected to the federal council. This gesture of political conciliation helped the Swiss to preserve a state of great stability.

The tendency toward political centralization grew steadily. The codes, or sets of laws, were unified, the proportion of federal taxes increased. Political and economic bodies began to rely more and more on state subsidies. Centralization brought an increase of bureaucracy, an evergrowing dependence on the federal authority.

Social Progress.—A vast project of old age insurance made progress during the decade and it was expected to be given a trial in 1948. In the organization of labour, mention should be made of an extension of collective bargaining. In the watchmaking and metallurgical industries, employers and workmen came together in 1938 and decided on a labour truce which obliged both parties to submit conflicts to arbitration. In certain fields, on the other hand, Switzerland displayed excessive conservatism. It remained one of the few countries in the world where women were still refused the right to vote.

At the beginning of World War II, a compensation fund was established to help soldiers to cope with the difficulties of prolonged mobilization. This measure went a long way toward preventing social troubles and proved of capital importance for the morale of the country. The wartime rationing system functioned almost to perfection. The black market was negligible. The country adopted an elaborate plan to intensify crops and general food production. Thus, thanks to the talent of a few men

Swiss fire fighters directing hose at a blazing structure after U.S. planes accidentally bombed Schaffhausen near the Swiss-German border on April 1, 1944. Several industrial plants were razed, and many persons were killed or injured

and the discipline of the population, Switzerland reached the end of the war with its labour and plant intact, a great social stability and sufficient reserve not to suffer from the dearth in Europe. Once the immediate danger had passed, the conflicts of interest between the bourgeois and socialist groups gained new strength.

Sydney

Capital city of the state of New South Wales, Sydney is the site of the first British settlement founded in Australia, the 150th an- E niversary of which was celebrated in 1938. Within statistical boundaries (157,000 ac.) the population of Sydney metropolis was 1,398,-000 (est. Dec. 1943). After London it had the largest European population of any city in the British commonwealth, and contained half the population of New South Wales. Its growth was late and rapid, the population being 383,000 in 1891; 630,000 in 1911; 1,235,000 in 1933; 1,279,000 in 1937. This growth was due to natural increase, overseas immigration and internal migration from

other parts of Australia. Toward the end of the decade 1937–46, growth of Sydney was retarded by a lowered birth rate and temporary suspension of immigration. Plans were, however, going forward for development of the metropolis on modern extensive lines. There was no standard boundary of the metropolis and contiguous to the statistical boundaries there was a population of more than 100,000, largely suburban in character. Local government within the statistical boundaries was administered by 50 separate municipalities, while in the contiguous suburban areas there were seven local municipal and shire councils. Water and sewerage, electricity, road transport and main roads were each administered by separate authorities.

In 1945 a Cumberland county council was established to draw up an interim plan and a master plan for urban, suburban and rural development covering the entire area of county Cumberland in which urban settlement extended radially some 20 or 30 mi. from the city centre. This embraced an area of 1,630 sq.mi. and a population of (approx.) 1,550,000 in which there were 66 local government areas. In 1946 the government decided to abolish these existing local government areas and to redivide the entire county area into eight local government units.

Switzerland Statistical Data

Although Sydney was extensively prepared against air raids during World War II, no bombing occurred. On one occasion a few shells from the sea did minor damage. Midget Japanese submarines in 1942 penetrated Sydney harbour and were destroyed. During the war Sydney became a supply base of the U.S. Pacific forces and in 1944 temporary headquarters of the British Pacific fleet. For the first time in its history the commodious natural harbour was utilized by the largest naval and merchant ships afloat. The Captain Cook dock, constructed during the war at a cost of £A9,000,000, was capable of accommodating the largest ships yet built or projected. (A. W. S.)

Symington, William Stuart

Symington (1901—), U.S. government official, was born June 26, 1901, in Amherst, Mass. He joined the army during World War I. Following the armistice, he attended Yale university, 1919–23. After completing his studies, he worked at the Symington company, a railroad equipment plant owned by his family. Later he entered the radio

manufacturing field, becoming president of Colonial Radio (1930–35) and of Emerson Electric Manufacturing company in St. Louis (1938). On June 7, 1945, President Truman named Symington as chairman of the Surplus Property board with the task of disposing of billions of dollars worth of surplus war property. Later, Truman's proposal that surplus property disposal be placed under the supervision of a single man was approved by the senate and on Sept. 18 he named Symington surplus property administrator. Symington resigned in Jan. 1946, and was named assistant secretary of war for air.

Syria

Syria, an independent republic, is bounded on the north by Turkey, on the east by Iraq, on the south by Trans-Jordan and Palestine and on the west by Lebanon and the Mediterranean sea. Its area is 73,587 sq.mi. Pop. (1935 census) 2,487,000; (1942) 2,800,000. The capital is Damascus (1942 pop. 275,651). Chief cities are Aleppo (299,218); Homs (96,600); Hama (66,463); Latakia (33,223); Deir ez Zor (10,000). Arabic is the dominant and official language. Turkish is spoken in the north and Kurdish, Armenian and Syriac are used by minority communities. The latter are mostly bilingual and also speak Arabic.

Islam is the dominant religious faith, consisting of several sects. Figures for 1943 were as follows: Sunnite 1,971,-053; Alawite 325,311; Druze 87,184; Ismailian 28,527; Shiite 12,742. Christian groups were as follows: Greek Orthodox 136,957; Armenian Gregorian 101,747; Greek Catholic 46,733; Syrian Orthodox 40,135; Syrian Catholic 16,247; Maronite 13,349; Protestant 11,187; Nestorian 9,176; others 10,715. Jews numbered 29,770; Yazidis 2,788.

The total population in 1945 was 3,250,000 (including about 400,000 Bedouin). Estimates in 1938 were 2,740,000 (including about 250,000 Bedouin).

Shukri el Quwatli was elected president of Syria Aug. 17, 1943. Prime ministers during the decade 1937–46 were as follows: Jamil Mardam (Dec. 28, 1936–Feb. 18, 1939); Lutfi Al Haffar (Feb. 23, 1939–March 16, 1939); Nassuh Al Bukhari (April 6, 1939–July 8, 1939); military government by the French established until April 2, 1941; Khalid Al Azm (April 2, 1941–Sept. 20, 1941); Hasan Al Hakim (Sept. 17, 1941–April 14, 1942); Husni Al Barazi (April 15, 1942–Jan. 29, 1943); Jamil Al Ulshi (Jan. 30, 1943–April 17, 1943); Ata Bey Al Ayyubi (April 17, 1943,—Aug. 17, 1943); Saadullah Al Jabri (Aug. 18, 1943–Oct. 11, 1944); Faris Al Khuri (Oct. 14, 1944–Oct. 2, 1945); Saadullah Al Jabri (after Oct. 1, 1945).

"Divide et Impera."—On Dec. 26, 1936, the Syrian chamber unanimously approved the Franco-Syrian treaty signed in Paris on Sept. 9. It was to become effective Jan. 1, 1937, and promised independence in 3 years—a goal for which Syrian nationalists had struggled for 17 years. Their high hopes for self-government, unification, withdrawal of

French armed forces from all but two bases and recognition as an independent state witnessed a series of frustrations and failures as the year wore on. Reactionary French officialdom persuaded the French chamber in Paris not to ratify the treaty. The prospect of eventual independence galvanized into action separatist moves which broke out in the four peripheral provinces. Enemies of Syrian independence found fertile ground in the suspicions, true or malicious, of the heterogeneous population, which were intensified by persistent propaganda. The pattern of intrigue was much the same, although its sources were different and the course of events varied in each case. From abroad, pressures were brought to bear on the sense of insecurity of cultural or religious minorities; efforts were made to intensify the fear of vested interests, such as the traditional tribal leaders; obstacles were placed in the way to impede and nullify the efforts of inexperienced national leaders. Therefore, every effort on the part of the Syrian government to consolidate its unity and independence was countered by a foreign power which played upon regional, clan, religious or linguistic susceptibilities to weaken Syrian independence and thereby maintain or enlarge a field of privileges.

There were four main areas affected by this conflict of nationalism against separatism. First was the Alexandretta (Hatay) sanjak. This province was 38.5% Turkish and under the Franklin-Bouillon agreement of 1921 it enjoyed certain linguistic, cultural and administrative privileges. Turkey claimed in 1936 that Syria would be incapable of protecting this region alone or of defending those privileges. It demanded a separate status, to which Syria protested. On May 27, 1937, France and Turkey agreed to the internal independence of what was then commonly called the republic of Hatay. It was to have a customs union with Syria but its government was to be elected by a fundamental law. This gave to the non-Turks a majority, whereupon in Dec. 1937, Turkey protested the law and demanded 22 of the 40 seats in the legislative assembly for Turkish-speaking members. In May 1938, assisted by Turkish pressure from outside, the Turkish minority began a determined drive to gain control of the assembly, causing riots, bloodshed and violence. On June 3 the French declared martial law. Meanwhile, France, needing allies, was negotiating an alliance with Turkey, which was announced on July 4, 1938. The next day the French invited Turkish troops to participate in restoring order. Once they were well entrenched, the Turks announced elections. Amid charges of intimidation and irregularities, the Turkish minority gained 63% of the members of the assembly. The latter immediately elected a solidly Turkish cabinet, thereby gaining complete domination of the government. In June 1939, the Turkish state announced annexation of the sanjak, called it Hatay, the 63rd province of Turkey, and formalized it in a treaty with France on July 23. Many Arabs and most of the Armenians preferred to abandon their homes and sought refuge in the Arab states to the south.

A second scene of discord was the Jazireh, the large semi-desert tribal northeast quarter of Syria. Mostly populated by nomads prior to 1914, it had become a place of refuge for increased numbers of Kurds, Assyrians and Armenians who disliked Arab domination. These newcomers constituted a majority in 1937 who resented inexperienced officials representing the city populations. On June 7, 1937, the Kurds revolted. Extremist nationalists represented the conflict as a question between Moslems and Christians with the Kurds assisting the Christians. The arrival of French planes and the presence of a Kurdish

chief stopped the plundering indulged in by the Arab Bedouin. Ignatius Gabriel Cardinal Tappouni of the Syrian Catholic church, who had at one time openly declared that Catholicism, Christianity and French influence in the Levant were inseparable, appealed to Paris for French protection of minorities. In Dec. 1937 the newly arrived governor was kidnapped and bloodshed followed, whereupon the French established direct control. Nationalists claimed the trouble had been inspired by French agents provocateurs.

The third area of disaffection was the Jebel Druze. The hardy mountaineer Druze tribes were perennially restless and in early 1937 refused to co-operate with the Damascusappointed governor. To calm their suspicions, a Druze governor was appointed in June 1937, and the hero of 1925–26, Sultan Atrash, was granted an amnesty. During 1938 the situation was relatively quiet but in July 1939, when the French were about to suspend the constitution, a few of the pro-French Druze chieftains declared the Jebel Druze independent and appealed for French protection. Other more prominent chiefs declared their loyalty to Syria. Again the nationalists blamed this on French officers stationed among the Druze.

A fourth troublesome region was the northwest Alawite (Noseiri) mountainous country. The fanatic Shia'h sectarians had always been an easy target for separatist intrigue. The French had not lost sight of this when they desired to put pressure on Damascus. There were incipient revolts in 1938 when the Alawites expelled the governor, and in 1939 when an erstwhile brigand, Suleiman Murshid, assumed religious hegemony, identifying himself as a manifestation of the divine, and seized the lands of many of his neighbours.

Mardam's Compromise.—These storms sorely beset the government of Prime Minister Jamil Mardam; but most damaging to the prestige of the National Bloc party, which dominated the cabinet, was the failure to gain ratification of the treaty. In June 1937, Dr. Abdur-rahman Shahbandar returned from exile in Egypt and used his fiery oratory to press the government for action. Mardam, feeling the disintegration of his position, decided to visit Paris to lobby his friends into ratification of the treaty. Forced into an impasse, he accepted six main modifications of the 1936 treaty which became known as the Mardam compromise. It would have granted: (1) a special internal regime for the Jazireh; (2) renewal on the original basis of the Banque de Syrie accord; (3) French concessions for the exploitation of petroleum; (4) renewal of the contracts of French employees; (5) appointment of additional French advisers; (6) recognition of the French right to intervene in defense of the minorities, which should have a special status. This compromise, announced on Nov. 15, 1938, spelled the doom of Mardam as a national leader. The French attitude had hardened. War seemed too near, and Syria was a strategic base. Oil had recently been discovered in Iraq and might be discovered in the Jazireh. The Blum government had fallen and George Bonnet announced on Dec. 14, 1938, that he had abandoned the idea of presenting the 1936 treaty to parliament. This galvanized the Syrian parliament, which announced on Dec. 31 that it would stand by the 1936 treaty and none other, and that Syria would assume full independence on schedule. These events split the National Bloc party wide open. Shurki el Quwatli resigned from the cabinet with two other members, and Dr. Shahbandar uncovered a vigorous party of opposition, denouncing the Mardam compromise as treason, bedevilling the impotence of the government in the existing business stagnation and criticizing its weakness in

assisting the Arab struggle in Palestine. The result was that leadership of the bloc passed from Mardam to the trio Quwatli, Saadullah Jabri and Faris Al Khuri.

On Jan. 2, 1939, the new French high commissioner, Gabriel Puaux, arrived and issued a series of decrees for the regulation of religious communities. Mardam was caught between the surging nationalist opposition and the French. Violence flared up, and on Feb. 18, 1939, Mardam resigned. Puaux tried to fill the vacuum by two short-lived and unpopular ministries and finally on July 7 he dissolved parliament, suspended the constitution and instituted a government by decree. Syria was dismembered again by setting up four separate administrations.

Vichy Dominance.—The outbreak of World War II put an end to political bickering, and most Syrian leaders pledged loyalty to Gen. Maxime Weygand when he arrived on Sept. 3, 1939. In June 1940, he was replaced by Gen. Eugène Mittelhauser who, after the fall of Paris, announced he would remain loyal to the Pétain government. Allied troops left Syria July 5, while Vichy began to replace officials with those considered trustworthy. The whole country was stirred in July 1940, by the assassination of Dr. Shahbandar in his office. Opponents of the government accused the bloc leaders, whereupon Mardam, with three other prominent officers, fled to Iraq. The group of assassins were caught and tried in December and at that time insisted that their sole motivation had been religious zeal. The fugitive leaders returned early in 1941. Their prolonged absence had left the field clear for the rise of the renovated National Bloc under the leadership of Quwatli, who consistently gained the allegiance of not only the National Bloc factions but others as well. When Gen. Henri Dentz arrived in Dec. 1940, Quwatli was in a position to demand formation of a national government instead of the rule by decree and in March 1941 his insistence led to strikes, demonstrations and then riots when the French arbitrarily tried to enforce certain antihoarding laws.

That the axis powers had plans involving Syria became apparent on Aug. 28, 1940, when, with Vichy approval, an Italian armistice commission arrived and began touring the country. In October a group of proaxis students returning from Germany opened the Arab club. Certain politicians appeared with strong anti-British propaganda and abundant funds. In Jan. 1941, the chief of oriental affairs in the German foreign office, Georg Werner-Otto von Hentig, arrived with credentials as a minister. Then in May, in spite of earlier British warnings, several squadrons of German combat planes refuelled by permission of Vichy authorities at Syrian airfields and went on to fight the British in Iraq. Other supplies went by rail to Iraq, and strenuous efforts were made to whip up pro-Arab anti-British fervour. This proved that as long as Syria was under Vichy control, it could be used as a base for an attack upon Allied positions in the middle east.

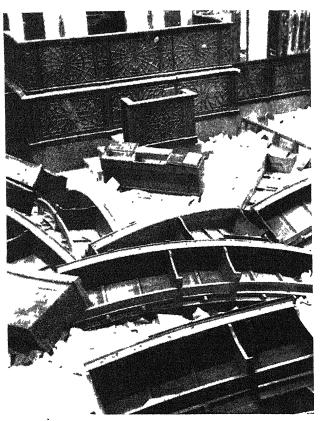

The Allies Strike.—Early on the morning of June 8, 1941, tens of thousands of leaflets were scattered over Syrian towns bearing the proclamation of Gen. Georges Catroux which included this phrase, "I come to terminate the regime of the mandate and to proclaim you free and independent—your state of independence and sovereignty will be guaranteed by a treaty." At the same time two columns of mixed British, Australian and Free French troops crossed the borders into Syria. Contrary to Allied expectations, the French troops fought a battle of honour for their Vichy officers and even carried out two notable counter-

attacks. With the arrival of British reinforcements, the French fell back and after yielding Damascus, an armisticc was concluded on July 10, 1941. The defeated Vichy army was given the choice of joining the Free French and remaining in the middle east or being repatriated to France. The combat troops, almost to a man, chose the latter, though most of the colonial officers who held positions in the Syrian government elected to stay.

The political situation was peculiarly delicate and difficult. In 1918 a British army allied to Arab forces had driven out the Turks and then, against the expressed will of the Syrian people, had given the mandate to France as a share in the spoils of war. Again in 1941, predominantly by British effort, Syria had been reconquered but only after definite promises had been made by the French to recognize the independence of Syria. In 1941 the Syrians were as adamant against further French control as they had been in 1919. Yet the Free French were anxious to rebuild French prestige, and the corps of French officials therefore resumed its authority as though nothing had happened since 1919, insisting that promises of independence were dependent on a treaty which would be negotiated when France was once more a nation with a recognized government. To clarify the British position, Capt. Oliver Lyttelton, British minister of state in the middle east, wrote to Gen. Charles de Gaulle on Aug. 15, "France should have the predominant position (in Syria) ... over any other European power."

To this De Gaulle replied, ". . . the pre-eminent and privileged position." On Sept. 9, Winston Churchill stated in the house of commons, "... our policy, to which our Free French allies have subscribed, is that Syria shall be handed back to the Syrians, who will assume at the earliest possible moment their independent and sovereign rights. ... But we recognise ... the position of France in Syria is one of special privileges and that (the influence) . . . of France will be pre-eminent." The Syrian leaders consistently refused to recognize any modification of their independence. To them sovereignty and special privileges were inconsistent. Under some pressure, General Catroux proclaimed Syria as independent on Sept. 28, designating Taj-ed-Din Al Hasani as president. He was known to consider Syrians as politically immature and to favour French hegemony. The whole procedure struck a sour note among the nationalists. The new president had recently come from France and had been appointed by the French-not elected. He chose a government in which no prominent bloc leaders were included. To them it looked like a ruse to perpetuate French domination. The bloc refused to co-operate, bringing on a virtual paralysis of government. The French seemed to want to delay elections indefinitely while the British favoured them and the bloc demanded them. Finally in March 1943, a provisional government was appointed with instructions to organize elections. These were held in July, and the bloc candidates won out by large majorities even in Aleppo where there was a split between two bloc candidates. But those suspected of being pro-French were conspicuously defeated. On Aug. 17 the new chamber met and enthusiastically elected Quwatli president.

Nominal Independence.—At long last, Syria had the title and machinery of an independent state, but the exigencies of war made foreign troops essential to security. The same French officers, who for two decades had ruled Syria, remained at their posts, obviously reluctant to surrender their positions of authority and privilege. Each

Syrian parliament at Damascus after French troops took over the building on May 30, 1945, in an armed attempt to halt protest demonstrations by Syrians against the continued presence of foreign troops

attempt of the new state to act as a free agent met with an open or hidden rebuff producing an increasing number of irritating incidents. On Nov. 11, news was flashed from Beirut that the French had arrested the Lebanese government and set up a pro-French regime because the Lebanese had proceeded to eliminate all references to the French mandate rights in their constitution. There was a surge of national animosity against the French in Syria, but the government acted cautiously and no untoward incidents occurred. Syria threw in its influence through the embryo Arab league then under formation and breathed a sigh of relief when the Lebanese government was released and restored to authority. But the government lost no time in pressing for a transfer of authority in relation to the 20 or more so-called common interests of both Syria and Lebanon administered by French officers. The French relinquished a few in the spring of 1944, such as antiquities, posts and telegraphs. But disagreement rose over such important questions as education, military control and security. In June 1944, the French pressed a university convention which would have riveted French cultural hegemony upon Syria and discriminated against other educational systems. But the question of jurisdiction over the maintenance of security involving the transfer of the 20,000 troupes spéciales paid for by the local governments but officered by the French, brought negotiations to a full stop.

The government was showing definite signs of attaining maturity. During July-Sept. 1944, it had been recognized by the soviet union, the United Kingdom and the U.S. as well as by several Arab states. In May 1944 a small riot developed when women appeared unveiled in theatres, but the government acted firmly and quickly,

refusing to be intimidated by fanatical groups. In Sept. 1944, the Druze voluntarily surrendered their age-old autonomy and entered Syria as a province. On Oct. 7, Syria signed the Alexandria pact establishing the Arab league. Without incident, the chamber had revised the constitution, dropping out the last article which had made the whole conditional upon approval by the mandatory power. All these gains were encouraging, but the crucial matter of troops and security remained deadlocked. As though to punctuate their importance, a revolt broke out in the Alawite stronghold in Feb. 1945, shortly after persistent rumours indicated that a French captain had distributed arms to the partisans of Suleiman Murshid. Syrian gendarmerie started to move in but were anticipated by French troops, and the Syrians withdrew. Many incidents took place which charged the atmosphere with rancour, hurt pride and veiled threats.

Revolt.-Victory in Europe added to the tensions when on May 16, 1945, a French cruiser arrived unannounced at Beirut, carrying about 900 French troops. More were on the way. The French explanation was that some were replacements and others were to be redeployed to the far east. But the Syrians were convinced that the arrival of large numbers of French troops violated their sovereignty and doomed their independence. The French blamed the rising tide of resistance to "the intrigue of a third power," but so widespread was the popular anti-French feeling that large numbers of the Syrians in the troupes spéciales began to desert lest they might be forced to fire upon their own people. By May 23 sporadic incidents of violence were spreading and Gen. Fernand Oliva-Roget issued an order to his officers to be cautious inasmuch as the "paid ruffians" of a third power "would be summarily disciplined soon." On May 27, a fusillade of shots was fired at a deserter escaping the French barracks in the centre of Damascus, killing and wounding several civilians. Toward evening, French artillery began a bombardment of the city that lasted sporadically for three days. The chamber was about to convene at 7:00 P.M. but had been dismissed by the president when he noted French armoured cars moving toward the parliament buildings. Claiming that snipers were using the building, the French moved in artillery and fired point blank into the building, killing all 14 guards who had remained. About 350 were killed in the indiscriminate bombardment of the city. At Homs and Hama, Syrian tribesmen rallied to isolate and surround the French garrisons while in the Jebel Druze, French officers were disarmed and held prisoners. Thoroughly exasperated, the British sent in an armoured mobile column on the 30th, separating the fighting forces.

Repercussions were world-wide. In San Francisco the United Nations was being born to the accompaniment of shouts by the Arabs of "French war criminals," while acrid public debates took place between London and Paris. Gen. de Gaulle directly accused British agents of fomenting trouble, stated that the French had restored complete order and that therefore British intervention was unnecessary. On June 5 Churchill reviewed the situation, denying both allegations. Meanwhile, under British escort, French troops and civilians were evacuated from Syria to Lebanon and those remaining were restricted to a few bases. Even then, the Syrians were not satisfied. They recalled the intimate association between French officers and separatist "revolts" and the memory of 1920 when French troops had used Lebanon as a base for an attack upon Damascus. Wherefore in Jan. 1946, at the first meeting of the United Nations Security council in Lon-

don, Syria and Lebanon registered a complaint against foreign troops on their soil in contradiction to the will of the nations. Although on Dec. 13, 1945, the United Kingdom and France began negotiating the matter of withdrawal, the conferences had broken down over details. With world attention focused on the situation, the United States delegate proposed on Feb. 16, 1946, that a definite time be set for withdrawal of troops inasmuch as it was considered a principle of policy that no small nation should have troops quartered upon its soil against the national will. The soviet representative vetoed the proposal as too weak, but both the British and French announced their intention to abide by the majority result despite the veto. By April 20 the last foreign troops left Syria. Celebrations lasting almost a week marked the occasion. A new government was formed. Its task was clear. Instead of the sterile struggle to ward off foreign domination, its reputation would stand on its ability to transform the dreams of the past into the realities of the

"Greater Syria."—A word should be said about the political conception of a greater Syria. Under Turkish rule—and even earlier—Syria had included Lebanon, Palestine and Trans-Jordan. Splitting it into four entities had been an accident of European designs. Greater Syria had a natural cultural, geographic and economic unity. Its political problems lay in the late creation of new political divisions and loyalties engendered by the policy of man-

*New unit of currency with the new status of Syria and Lebanon as independent republics.

datory powers. In addition, they were complicated by the existence of the old Christian population of Lebanon and the new Jewish community in Palestine. Some Arabs continued to favour Iraq's entering a greater Syria federation. A few Jews supported such a scheme, with modifications favouring Jewish immigration. King Abdullah of Trans-Jordan favoured the idea, if he were to be king of greater Syria. In 1945 Quwatli expressed the official Syrian attitude toward it. He favoured a greater Syria if it were to be a republic with its capital at Damascus, but his ultimate hope was Arab unity. The French, utilizing the principle of division, disliked the inclusion of Arabs under British influence. To the British, the plan had more advantages than were at first apparent, for it would serve as an instrument to fill in the security gap that would arise in case of the threat of a new war. Although greater Syria was not a concept likely to grow rapidly, its roots were fed by elements that went far back in Arab history and, in one form or another, would probably survive modern nationalism and dynasties. Pan Arabs favoured such a regional development as a step toward ultimate Arab federation. (See also Mandates.)

Syrovy, Jan

Syrovy (1885-), Czechoslovak general and politician, was born in Bohemia. He practised architecture in Warsaw, Poland, and in 1914 joined the Czech brigade in the Russian army. Promoted to a lieutenant, he lost his right eye in the fighting on the Russian front. After the Russian Revolution, he commanded two divisions of Czech legionnaires that fought against the Bolsheviks and cooperated with the Allies. Repatriated to his homeland, he became inspector general of the Czechoslovak army in 1935. In 1938, he succeeded Dr. Milan Hodza as premier. Although he was prepared to resist a German attack, he was obliged to yield to German demands "legitimatized" by the Munich pact. After Eduard Beneš' resignation on Oct. 5, 1938, Syrovy became acting president of the republic. He promptly came to terms with the reich and began to model the government along National-Socialist lines. After Emil Hacha's election to the presidency, Syrovy resigned and on Dec. 1, 1938, he was appointed minister of national defense.

Syrup, Sorgo and Cane

The area of sugar cane harvested for syrup in the United States declined from 143,000 ac. in 1937 to a low of 102,000 ac. in 1940 and then increased again to 152,000 ac. in 1945. Total production was 23,844,000 gal. in 1937 and dropped to 13,415,000 gal. in 1940 but recovered to 24,450,000 gal. in 1946. The 10-year average 1934-43 was 20,890,000 gal. The increase in the latter year was due to favourable weather for the cane crop as well as to the advance in price. The average price to farmers was 44.5

cents per gal. in 1937 and advanced to more than \$1.00 in 1945. Louisiana produced about one-third of the crop, but the price was lower than for the crop of any other cane state, being only 66 cents per gal. in 1944 compared with \$1.50 in Arkansas and \$1.45 in Texas, both small producers.

Sorgo syrup during the decade 1937-46 was produced in 17 states, mostly in small quantities, with 6 states producing about half the U.S. crop on the average. The total acreage averaged 240,000 ac. in 1933-42 but later declined to about 200,000 ac. The average price for the whole crop advanced from 56.8 cents per gal. in 1937 to \$1.37 in 1944 without apparent stimulation of the output. Total produced was 12,481,000 gal. in 1937 and reached a high of 13,772,000 gal. in 1942, only to drop to 12,074,000 gal. in 1946. (See also Beekeeping; Maple (J. C. Ms.) Products.)

For statistics of consumption see U.S. Dept. Agric., Agricultural Statistics; Bur. Agric. Econ., Farm Production (1914).

Table Tennis

South Carolina . .

At the start of the 1937-46 decade, the International Table Tennis federation had advanced the game from a parlour pastime to an athletic sport which required a playing arena of 25 by 60 ft. for the hard-driving and deep defense of championship matches and attracted galleries of 10,000 spectators. Thirteen nations contended in the 11th annual world championships in 1937 at Baden, near Vienna, where the United States, a comparative newcomer in international competition, became the first to win both team cups simultaneously. Previous men's Swaythling cup winners were Hungary (eight times), Austria and Czechoslovakia (once each); previous women's Corbillon cup winners were Czechoslovakia (twice) and Germany (once).

To improve the game's spectator value, the I.T.T.F. congress banned hand-spin services, lowered the net from 63/4 in. to 6 in., and ruled against excessive defensive play (known as "stonewalling," "chiseling" and "pushing"). Finals of the 12th world championships in 1938 in London were played at the Empire Sports arena, Wembley, with 16 nations represented. The 13th world championships, involving 12 nations, were played in 1939 in Cairo under the patronage of King Farouk and Queen Farida. Outbreak of war in Europe caused the I.T.T.F. to suspend activities. Until then, these world titles had been

Men's teams (Swaythling cup)-1937, U.S.A.; 1938, Hungary; 1939, Czechoslovakia.

Women's teams (Corbillon cup)-1937, U.S.A.; 1938, Czecho-

slovakia; 1939, Germany. Men's singles—1937, Richard Bergmann (Austria); 1938, Bohumil Vana (Czechoslovakia); 1939, Richard Bergmann (Austrian exile in England).

Men's doubles-1937, Robert Blattner and Jimmy McClure (U.S.A.); 1938, Jimmy McClure and Sol Schiff (U.S.A.); 1939, Viki Barna (Hungary) and Richard Bergmann (England). Women's singles—1937, declared vacant after a draw between

Women's singles—1937, declared vacant after a draw between Trude Pritzi (Austria) and Ruth Hughes Aarons (U.S.A.), defending champion; 1938, Trude Pritzi (Austria); 1939, Vlasha Depetrisova (Czechoslovakia).

Women's doubles—1937 and 1938, Vlasha Depetrisova and Vera Votrubcova (Czechoslovakia); 1939, Hilde Bussmann and Truda Pritzi (Carmany)

Trude Pritzi (Germany).

Mixed doubles—1937, Bohumil Vana and Vera Votrubcova (Czechoslovakia); 1938, Laszlo Bellak (Hungary) and Wendy Woodhead (England); 1939, Bohumil Vana and Vera Votrubcova (Czechoslovakia).

Istvan Kelen and Miklos Szabados, Hungarian stars, met defeat in Japan on a 60,000-mi. world exhibition tour ending in 1939. In 1940 the Japan Table Tennis association, inaugurating what were intended to be annual Pan-Pacific matches, invited Australian and U.S. teams and defeated both; the possibility of return matches was cancelled by Pearl Harbor.

The war crippled civilian play, which concentrated on benefit tournaments and exhibitions for the Red Cross and other service organizations. Most players of the warring nations being in the armed forces scattered around the world, table tennis was conducted as a recreation for troops, who played in military championship tournaments and watched exhibition matches by stars, whose schedules often required long aeroplane flights over seas, jungles and mountains.

The I.T.T.F. was revived in June 1946, and the 14th world championships were designated for Paris in Feb. 1947. As against 28 associations in full membership or good standing in 1939, in 1946 there were 18 full members (Australia, Belgium, Czechoslovakia, Egypt, England, France, India, Ireland, Luxembourg, Netherlands, New Zealand, Palestine, Poland, Sweden, Switzerland, U.S.A., Wales, Yugoslavia); 3 in good standing (Jersey, Ontario, Scotland); 3 eligible for restoration of membership (Canada, Latvia, Lithuania); 5 former axis member associations of undetermined status (Austria, Germany, Hungary, Japan, Rumania); and 10 in prospective membership, including the U.S.S.R .- a total of 39.

BIBLIOGRAPHY.-Coleman Clark, Table Tennis (1938); Sol Schiff, Table Tennis Comes of Age (1939); Emily M. Fuller, Top-Notch Table Tennis (1942); Jay Purves, Table Tennis (1942). The annual Handbook of the International Table Tennis Federation (W. J. Pope, London), which is published in English, French and German, was suspended during the war, as was the English monthly Table Tennis. The U.S.A. monthly Table Tennis Topics has been published continuously since 1933.

Tactics of World War II

In all previous wars the aim was to defeat the enemy armies and destroy his will to fight; in World War II it became possible to enlarge this aim to include total destruction of his ability to fight. This was the first total war.

In World War II, as in all wars, tactics and techniques of employment were controlled by the weapons and equipment available. World War II saw the development of mechanization to an extremely high degree. This resulted in combinations of mobility, speed, power and range previously unknown. Scientific developments in various fields, the development of subsistence and clothing, enabled full-scale campaigns to be carried out in inaccessible areas previously considered unsuitable for large military operations with weapons and equipment of mod-

ern warfare. Full exploitation of the capabilities of mechanized warfare produced dramatic and startling results whether the fighting was on the frozen wastes of the arctic tundra, the mountainous jungles of the South Pacific, the deserts of Africa, the marvelously engineered fortifications of Europe, the great amphibious operations in both hemispheres, or a vertical envelopment by airborne troops. This great variety of tactical operations caused many different adaptations and changes in standard organization and uses of equipment. Tactical success depended on the most skilful combination of the means available into a task force to accomplish the objective.

The successful application of tactics in World War II, as in earlier wars, depended upon a clear understanding by commanders of the capabilities and limitations of the forces at their disposal, and upon a vigorous application of tactical methods used on a thorough and rapid evaluation of all available information about the enemy's forces. This was equally true of the tactics of whole theatre forces down to those of the smallest combat units.

In all the main theatres of war the infantry division (and its equivalent in the U.S. marine corps) was the basis of organization of the field forces. This unit, numbering some 15,000, was the smallest unit which had within it all essential ground combat arms and services, and which could carry out operations of some importance acting alone. However, "task forces" were frequently organized to carry out special operations. These forces generally consisted of a regiment of infantry, a battalion of field artillery and attached service units as well as a headquarters similar to a division headquarters. The chief combat elements of each infantry division were three regiments of infantry, four battalions of field artillery and a battalion of combat engineers.

The U.S. army contained 67 infantry divisions (including 1 special mountain division) of which 42 fought in Europe and 25 in the Pacific. In the Pacific also were six marine divisions.

There were, in addition, five U.S. airborne divisions, four in Europe and one in the Pacific. These were smaller with generally lighter supporting weapons. Their troops moved by aeroplane and landed either by parachute or glider drop to fight. These were used against objectives within axis-held territory, but in co-operation with other forces of which infantry divisions were the principal combat elements.

The 16 U.S. armoured divisions each had as chief combat units 3 battalions, consisting of 3 companies of medium tanks and 1 company of light tanks, 3 battalions of armoured infantry transported in armoured half-tracks and 3 battalions of field artillery. All of these divisions were used in Africa and Europe. The one U.S. cavalry division, using motor and armoured vehicles rather than horses, was used in the Pacific theatre.

All types of divisions were, when necessary, augmented in strength by the support or attachment of additional field artillery, armoured (separate tank battalions), engineer, chemical, anti-aircraft and (sometimes) infantry units.

The next higher tactical unit was the corps, made up of two to as many as ten infantry, armoured and airborne divisions, and corps headquarters and supporting troops such as field artillery and tank units. The next larger unit was the army, formed of a variable number of corps plus army headquarters and supporting troops. The army group consisted of two or more armies and headquarters and

additional troops. The largest field force, that in Europe, contained at its maximum two U.S. army groups (one containing certain large French units) and one British army group, together with U.S. and British tactical air units, and headquarters, supporting and service forces.

All U.S. operations and those of Allied armies were conducted on the principle that no one arm, such as infantry, armoured or air forces, could win battles, because it took the combined action of all to assure victory. It was true that the infantry units sustained nearly three-fourths of all air and ground combat casualties and 90% of those in the ground combat forces. This simply shows that infantry was the basic, central arm of close combat, not that it could have done without the tremendous supporting power of artillery, air and other types of assisting units. Infantry was the strong cutting edge of the armies, the one part capable of taking and holding ground and of keeping up a sustained direct pressure on the enemy's forces which had to be defeated and destroyed in order to win. It was also the only element of U.S. forces capable of manoeuvring on ground too difficult for armoured forces and too covered for air units to find rewarding targets. Much of the ground fought over in every theatre of war was of this type; for example, the jungle-covered islands of the Southwest Pacific area and the many forests of France and Germany. But, generally speaking, the tactics used by all the principal armies were basically infantry tactics, since what all other combat arms did depended upon how the infantry was used, in both offensive and defensive action.

The offensive tactics of the different Allied and axis armies were not radically different. Lack of supporting weapons made the organization of the Chinese combat forces somewhat simpler and the tactics were correspondingly simpler and for the most part defensive. For all armies the tactical problem was the same—how best to gain or hold a given area and reduce the strength of the enemy's defense or attack. All armies had to use large numbers of infantry, and the control and application of such combat forces could be accomplished only through organization into units of ascending size and the issuance of combat orders from the top down. Hence tactics could vary only in relatively minor respects, chiefly according to the general nature of the terrain and the means of warfare available.

Offensive Tactics

As in all preceding wars, the tactics were offensive and defensive, those used in attacking and those used in defending against an attack; and in most battles the force of one side used generally offensive tactics and the other defensive. But at any stage of the battle up to that of complete victory for one side and defeat for the other, parts of the attacking forces were often temporarily on the defensive, and parts of the defending forces on the offensive, as in making a counterattack. The offensive tactics used were in general as described below.

The purpose of offensive action was to destroy the opposing force. The commander of the attacking force, however, selected a specific physical objective, such as an area of high ground, a city or group of cities, or some other vital area well in rear of the enemy's forward position. The objective had to be one that could be reached by the attacking force or unit within the time required by the higher commander and by manoeuvre over the available ground, usually limited by the fact that other

units of the same attacking force required the adjacent space for their own part of the battle. The objective had also to be one, the taking of which would either insure the capture or complete breaking up of the enemy force, or so threaten the enemy force that it was forced to retreat. Objectives had also to be good places from which to begin the next attack. Once the objective had been selected, the commander concentrated the main effort of his available troops in the direction best calculated to gain the objective.

Thus, in the well-conducted battles of World War II, the main driving power was concentrated into a small fraction of the whole front. On other parts of the front there were also attacking troops, but in much less strength than at the point of main attack. "Secondary attack groupings" had as a purpose to keep the enemy from shifting his forces, force him to commit his reserves in the wrong place and keep him from reinforcing the front of the main attack.

Once the commander began an attack he could not readily use any sizable part of his force or unit for another purpose. For once his units were spread out and fighting, they could be shifted to some other front only at risk of heavy losses. The commander could, however, influence the course of an attack already begun through the way in which he used his reserves which were the part of his force (up to one-third of it) which he held back at the beginning of an attack for later use. He could also influence the course of battle by shifting the fire of his artillery and other supporting weapons, and obtaining available additional fire or air support from a higher commander.

Attack Manoeuvres.—There were but two main kinds of attack manoeuvres-envelopments and penetrations. In an envelopment the main attack was directed around the principal forces of the enemy against their flank or rear, toward an objective in the enemy's rear. The aim was to surround the enemy's force before he could withdraw it. An enveloping action was usually supported by a secondary attack, made simultaneously or nearly so, against the enemy's front. The commander would strike fast and unexpectedly with the enveloping part of his force and avoid attacking on ground chosen by the enemy for battle. One of the major envelopments of World War II was the Allied envelopment of the German defending forces in Normandy after the U.S. forces had driven south through St. Lô into France as far as St. Nazaire and Angers and the British had reached the vicinity of Caen. This placed the Allied forces generally on the north and east of the German forces endeavouring to hold and break up the Allied invasion.

The next stage of the attack was an envelopment in which the British 2nd army and Canadian 1st army attacked from the north and the U.S. 1st army from the east, and the U.S. 3rd army drove far to the east and then turned north to cut off the German forces entirely. In this battle of the Falaise-Argentan pocket, the long U.S. envelopment manoeuvre and the shorter British gains against heavy opposition did not close completely the gap behind the German forces. Much of the armour got away, but seven infantry divisions and many other troops were surrounded and captured. This was a "double envelopment" with attacks directed to close around both flanks of the German force, and a third against its front. In the Pacific operations, envelopments in a sense were carried out by completely by-passing certain islands occupied by the Japanese and attacking others beyond them, thus cutting off the by-passed islands from shipping and therefore from supplies of food, equipment and ammunition.

Envelopments were usually less costly and more decisive than penetrations. But an envelopment was not always possible, usually because of the fact that the enemy had defenses organized from sea to sea. In World War I, the German armies stretched from Switzerland to the North sea, and it was not possible to send a force around them except by the wide route through the Mediterranean and the Balkans. In World War II the Germans held all of France, and Italy was an axis partner. But by first clearing the axis out of North Africa, it became possible gradually to attack by a great double envelopment from north and south, using sea routes. But for the two Allied forces attacking Normandy and southern France, the German defenses did not permit an envelopment initially. Each had to make penetration first. In the Pacific island-toisland campaigns, envelopments by sea could readily be made. But in most of the attacks upon the smaller and heavily fortified islands, there was little room for envelopment since the defending Japanese forces were distributed across the full width of the islands in strong fortifications, and once ashore, it was impossible for a force to manoeuvre around them.

In general, a penetration attack had to be used when envelopments were impracticable. Such attacks could be delivered faster than envelopments because there was less distance to go, and when a rapid attack had to be made for any reason, as when the enemy was known to be unready, the penetration manoeuvre was often best. A penetration might also be better when a strong attacking force could be used against a relatively weak or thinly spread defensive force.

In a penetration, as in an envelopment, a main attack and a secondary attack or attacks were made. The commander directed the main or heavy part of his whole attack toward an objective in the rear of the enemy's front but through that front. The aim was to strike hard and break through, thus splitting the opposing force. Upon capture of the objective the further aim was to "roll up" one or both of the parts into which the enemy's force had been divided. The main attack was made on a wider front than the width of the expected break-through. This gave the main attack force strength from which to protect the flanks of the penetration as the operation continued; but if it went far, additional units had usually to be directed to follow the main attack force for this purpose.

In 1940, the strong German attack to the channel ports was a penetration which split the British forces in Belgium and the Netherlands from the French and from their own reserves. The forces in this attack prevented the British from retreating south with the French; other German forces enveloped them from farther north through the Netherlands. Still other units were poured into the breakthrough and turned south to attack and defeat the French and north to attack and defeat the British. Most of the blitzkrieg attacks were rapid penetrations by strong forces against forces weak in weapons or spirit, attack which became double envelopments as the penetration forces turned to right and left from their first objectives to roll up and surround the forces caught between them. The German army used this same method successfully in 1941 and 1942 against the Russian forces. And in 1945, the Allied forces used similar tactics most successfully against the Germans, as in the operations to reach the Rhine and in the final phases of the war in Europe, including the envelopment of the Ruhr by the U.S. 9th and 1st armies, and in the operations of the U.S. 3rd and 7th armies which made the juncture with the Russian forces in Austria and southern Germany. In the Pacific warfare the penetration was often used to cut an island, and the Japanese forces on it, in two. This was done by the marine forces on Iwo Jima and by the combined army and marine forces on Okinawa. Most of the landings made from the sea and most attacks across sizable river lines made in World War II were penetrations of necessity. The attempt was made, however, to deceive the enemy to the last moment as to the actual point of the main attack, thus preventing him from strengthening his defensive forces at that point. Even so, there was usually heavy fighting to gain a good loothold, a beachhead from which to deliver further attacks. Indeed, for the bulk of the subordinate units in all the large campaigns, the offensive tactics were more generally those of penetrating the immediately opposing forces rather than enveloping them, although it was often possible to apply enveloping manoeuvre on a small scale.

Small-unit Offensive Tactics.—The tactics of the smaller combat units, the regiments, battalions, companies and platoons, followed the same general principles of surprise and concentrated application of power and, above all, teamwork that applied in the employment of larger forces. The U.S. infantrymen were trained to take full advantage of the ground and keep on advancing under fire by manoeuvre in which some men or units advanced while others covered their movement by fire. The commander on each level could manoeuvre his own subordinate units within the framework of the higher unit's mission.

Frontages of Attack.-Orders for an attack given by a high commander, for example, an army group commander, would designate the width of front for each attacking army by stating the boundaries between the armies within which each army would largely confine its own attack manoeuvre. The order would also indicate what proportion of the whole force would constitute the reserve. Each army commander's order stated which of his corps would lead the attack and which would be in reserve and gave the boundaries between the leading corps. In like manner, corps commanders designated assault and reserve divisions; and division, regimental, battalion and company commanders issued similar orders to their subordinate units. Thus on an army group front of, say, 200 mi., with 3 armies attacking, an army might be responsible for 50 to 100 mi. of front or more, a corps for 10 to 30 mi., a division for 1 to 5 mi., and so on down to companies with a few hundred yd. and platoons with a few score yd. of front. The front for any unit varied considerably, depending on whether it was a part of the main attack force or of a secondary attack force or a force that would temporarily be operating on the defensive. The main attack was, as we have seen, delivered on but a fraction of each unit's front.

Offensive Tactics of Armoured Units.—Large armoured combat units were used extensively by all the armies except the Chinese, which had but limited numbers of tanks, and the Japanese, whose limited numbers of armoured vehicles were never used in large concentrations. The experience with armour disproved the theories which arose between the two world wars that "mass armies" with infantry were no longer needed and that highly mobile armoured forces working closely with air forces had taken their place. There were too many areas where the tank could not operate freely, and the tank was vulnerable to improved antitank ground weapons and often to attack from the air. But World War II also proved that, properly employed within their limitations and used with other combat arms, armoured units were of high value.

Tanks were used in two principal ways: (1) in armoured divisions containing approximately 300 tanks organized into battalions and companies, and units of armoured infantry, artillery, engineers and other branches of a large armoured combat team; (2) in "separate tank battalions" to fight with infantry units of infantry division. Armoured divisions were used extensively in the German campaigns against France and Russia, in the campaigns in North Africa and in the final campaigns against Germany through France and from Russia. It was impossible to use large armoured units in the Pacific. In Africa, Europe, China-Burma-India and the Pacific, tanks were much used in close co-operation with infantry.

The primary role of the armoured divisions of all armies was the same as for the U.S. units-offensive operations against hostile rear areas. Throughout the war, however, even in the early stages of the blitzkrieg against France and Russia, armoured forces could not break through strong defenses with the help of air units alone. Infantry, heavily supported by all arms, had to make the opportunities for the faster-moving armoured forces to exploit. Infantry divisions first had to overcome heavy resistance, break defenses, weaken the enemy and secure ground so that armoured divisons could pass through the gap thus created and launch their attack. The battle of El Alamein (1942) which, in its second phase, was a decisive battle of tanks against tanks, opened with an attack by four British infantry divisions working with artillery, engineer and air units for four days to clear a path for the armoured units through the German defenses. And often, in other campaigns, it took long hard fighting to make the gap.

The armoured infantry battalions which formed part of the armoured divisions consisted of infantry transported in armoured half-tracks that gave protection against enemy small arms fire. Armoured infantry left its half-tracks to fight; it was especially important to armoured divisions after antitank rocket launchers had been perfected for use by the individual infantryman. Without infantry to fight opposing infantry thus equipped, tanks could become an easy prey. A mission of armoured infantry was to attack to seize terrain favourable for launching a tank attack but it was usually insufficient in numbers to make an original break-through against strong defenses, and there had to be a full-scale attack by available infantry divisions and supporting units before armoured divisions could pass through the enemy's main defenses and into his rear areas with speed. Attempts to use large armoured units against strong defenses always resulted in crippling losses, as in the British drive for the Caen area in June 1944. Thus the most important tactics of armoured divisions were those used in spearheading attacks against an enemy incompletely prepared for defense, breaking through on a wide front against a demoralized enemy, exploiting a success and pursuing a defeated enemy and completing his destruction by deep penetration and encirclement. At times, large armoured units were also used to attack enemy armoured units.

Infantry-Tank Tactics.—The U.S. tactics of close tank co-operation with the smaller infantry units were similar to those of other armies. Early in the war several separate tank battalions, not part of a larger armoured unit, were assigned to each U.S. army. But in the European campaign the need to attach one such battalion to each infantry division became apparent. These battalions fought closely with each division, usually with one of the three medium tank companies of the battalion fighting

with each of the three infantry regiments. The infantrytank combination used offensive tactics of close co-operation and mutual assistance. The infantry assisted the tanks by fire against the antitank weapons of the opposing infantry, and the tanks assisted infantry by close fire on the enemy's machine guns and other automatic weapons. On bad terrain, such as the rocky ground heavily covered with undergrowth on many Pacific islands, one or two tanks were often used to assist infantry against strong defenses. Artillery was usually a third member of the combat team, and engineer units, using explosive charges, often made a fourth. When the hostile resistance was sufficiently light, the tank units working with infantry could use mobile tactics. Possible missions of these units included leading an attack, feeling out the Japanese and developing weak spots, exploiting a success, breaking up hostile counterattacks and assisting the infantry in mopping up. The four separate tank battalions with the U.S. 6th army in the Luzon campaign of 1944 were frequently able to operate as battalion units to good advantage.

The other armies all made similar use of close support tank units. Early in the war the Russian army frequently used single tanks as a part of small infantry combat teams. The Chinese tank units in Burma operated closely with infantry.

Defensive Tactics

The clear statement of the object of defensive warfare found in the U.S. *Field Service Regulations* could be applied to most defensive operations of all armies in World War II:

The general object of defensive combat is to gain time pending the development of more favorable conditions for undertaking the offensive, or to economize forces on one front for the purpose of concentrating superior forces for a decision elsewhere. Under the first of these objects, a commander may assume the defensive pending the arrival of reinforcements, or he may be thrown on the defensive by inferiority in numbers, disposition, or training. He may take up a defensive position and invite attack as part of a deliberate plan to win the battle by a counteroffensive. Under the second object, the defensive is usually expressed in the mission received from higher authority. This mission may be to hold a vital area pending completion of the maneuver of other forces to protect a flank, or to contain an enemy force while an offensive is being conducted on another part of the front or in another theater.

Defensive tactics included the idea of organizing a fortified battle position to be held at all costs (Bataan and Corregidor were examples), but the Chinese forces made extensive use of defensive tactics, gradually giving way without fighting extensive battles. The following were, in general, the defensive tactics used in World War II.

Defensive Positions.—In setting up a defensive position, the commander selected the best ground for the purpose within the limits of his orders from the next higher commander. The position was selected to facilitate future manoeuvre, and make the enemy attack the position directly or conduct a time-consuming manoeuvre. The position was divided into sectors assigned to subordinate units, part of which, however, were not put into position but held as a mobile reserve. Positions might be hastily occupied when a force was surprised by an enemy ground attack; or when there was more time, positions might be deliberately selected after thorough study by the commander and his staff. Reconnaissance as thorough as the available time permitted was made to pick the best ground. Sometimes an attack was made to seize better ground for a defense.

All positions involved setting up protection against

attack from any direction—from front, flanks or rear and from the air—even when the terrain or other circumstance made attack from a particular direction highly improbable. Ridges, valleys, rivers, woods, swamps, lakes and other natural obstacles might all be important to a defensive position.

A defensive position was "organized" by placing infantry and supporting units so as to permit the most accurate and continuous fire on the attacking enemy, and permit one defending unit to direct its fire to assist other defending units nearby. Since from a given defensive position all infantry and supporting weapons could cover a considerable area with fire, a defending force was not evenly distributed over its area. The gaps of some width between small-unit positions usually consisted of ground exposed to potential enemy fire, and were covered by obstacles and fire from two or more positions. Such unoccupied ground was usually occupied at night or during foggy weather.

Within each of the subordinate defense positions making up the whole defense area, riflemen and others equipped with light automatic weapons were placed so that their fire would be most effective, not only to the front but to the flanks across the front of the positions of adjacent units. The fire of heavy types of machine guns was especially deadly for such use.

Defensive positions were organized in considerable depth. The U.S. term for the principal defense line was "the main line of resistance," an imaginary line touching the forward edges of the forward defense positions all across the front, the defenses for which extended back at least several hundred yd. Other "lines" were organized farther back more or less parallel to the main line of resistance, so that to be successful a hostile attack had to penetrate through a series of defenses that might be miles in depth.

Artillery units occupied areas in the rear of the main line of resistance and placed concentrations of fire in front of the defending infantry. Infantry supporting weapons used positions farther forward. The fire of all weapons was co-ordinated in a defense plan. Supporting tactical aviation bombed and otherwise attacked approaching enemy forces, artillery and reserves, supply and railroad establishments, airfields, bridges and any other suitable targets. Organization of a defensive position included fortification, which might begin with hastily dug foxholes and weapons emplacements but which was constantly improved as long as the defensive position was occupied.

In World War II, there were many long highly fortified places involved, such as the Maginot, Siegfried and Hitler lines in Europe, Corregidor in the Philippines and Pantelleria in the Mediterranean sea, all the work of years. Other substantial defenses, such as those of the Japanese on Iwo Jima, Saipan and Okinawa, had been developed into an intricate defensive network through many months. Engineer troops were used to plan and develop extensive fortifications.

Flexibility in shifting defensive reserves rapidly to meet new attacks was also essential in defensive tactics. The fact that the German defense of Normandy was made static by bombing of communication lines contributed much to Allied victory. The French army of 1940 was unable to move reserves rapidly or counterattack swiftly.

When the enemy's attack against a position was first discovered, artillery and air units might begin the defense by opening on all possible hostile targets. If the enemy succeeded in launching his attack, artillery fires were continued on his forces as close to the defending troops as

was safe. A defensive battle position was protected from surprise by outposts to the front of the main line of resistance, which delayed the hostile attack by forcing the enemy to deploy his units, and which deceived the enemy as to the real position of the main defenses. Outposts withdrew when forced by the pressure of the enemy's attack. When the attack came within its reach, the defending infantry opened on the enemy with all its many weapons. U.S. defensive doctrine envisaged the stiffest possible defense of battle positions. Field Service Regulations stated: "A unit entrusted with the defense of a tactical locality under no circumstances abandons it unless authorized to do so by higher authority. Important localities on the main line of resistance must be defended to the last man." On Saipan in 1944 a force of some 5,000 Japanese infantry attacked a line held by a few hundred men of the 27th infantry division. The defenders on the main line of resistance killed more than 2,000 Japanese before being overwhelmed by sheer fanatical numbers. Russian forces defended Sevastopol and Stalingrad with similar last-man tactics.

When the enemy broke through a defensive position, the defender turned his effort to limiting the penetration and then ejecting the enemy from the main battle position. The battle of the Bulge in Europe, Dec. 1944, was perhaps the best-known large-scale example of World War II, and illustrated equally how the smaller defending units fought to limit and break up penetrations. The sudden, powerful German attack broke extensively through the hastily organized defenses of the opposing forces. Allied reserves were brought up rapidly to meet the attack. Other units were rearranged for counterattacks from north and south against the sides of the German attack, which was a threat of encirclement to the successful break-through forces. The desperate fighting of surrounded units, notably at Bastogne, cost the Germans time and effort and slowed them down. The Allied pressure from all directions soon became so intense that the attack was halted halfway to its objectivethe splitting of the Allied forces and the recapture of Antwerp. And soon further Allied offensives recaptured the lost ground and more.

Retrograde Movements.-Defensive tactics included the efficient carrying out of withdrawals when they became necessary. Disengagement of a force or unit from combat was called "withdrawal from action" and might be followed by a "retirement." Planned resistance up to a certain point, followed by successive retirements to new lines of temporary resistance up to a certain point, followed by successive retirements to new lines of temporary resistance was called "delaying action." Throughout World War II there were many such operations both on a large and small scale. Their proper conduct had great importance, for it could usually save a defeated force from destruction. The two greatest retrograde movements of World War II in point of numbers involved were those of the Russian armies in the face of the German attacks of 1941 and 1942, and those of the German armies before the Russian attacks of 1943-45. Both were on a front of nearly 2,000 mi. and involved several million men. The Chinese retrograde actions from 1937 on also covered a great area and involved large numbers. Smaller but of importance were such operations as the British, and later the German, retirements across parts of North Africa, the U.S. delaying action on Luzon in 1941–42, and the U.S. and Chinese retreat from Burma in 1942. The Japanese often based their defensive tactics largely on defending in one place till overpowered,

with the final result of great disorganization and heavy losses. Often, of course, it would have been impossible for them to retire from an occupied island after shipping had been destroyed by air and naval action.

Withdrawals from action by daylight, always considered difficult and costly operations, were found even more so in World War II because of detection and attack from the air. Hence, when possible, withdrawals were conducted by night or by daylight in fog or heavy weather. All retrograde operations of any size were usually carried out according to plan. Even when the enemy succeeded in making a surprise attack, commanders and their staffs speedily determined the best tactical moves to minimize losses and offset the hostile pressure. The delaying actions and retirement to Bataan of the U.S.-Philippine forces in 1942 were carried out in accordance with a plan of long standing. The retirement of U.S. units in the battle of the Bulge was under guidance of the higher commanders who planned at once how to meet the situation. When such plans were not used, or were too slowly developed, as in the French army of 1940, the retirement generally became an unmanageable rout.

Antimechanized Defense.—In World War II, antitank guns, rocket launchers, tank destroyer guns, medium and heavy calibre artillery fire and mines were the chief defense weapons of ground troops against armoured attack. An attacking as well as a defending force or unit often had to use defensive measures against tanks. Tank units themselves were considered offensive units rather than defensive but often used hit-and-run tactics to avoid continued exposure to heavy antitank fire. U.S. tanks were sometimes used in a purely defensive manner as small mobile forts; this was the usual method of tank employment by the Japanese, especially on Luzon and Okinawa.

Tank destroyers were armoured vehicles carrying powerful guns for use against tanks. Tank destroyer units used tactics of lying in wait to surprise hostile armoured forces, and fast hit-and-run battle tactics. Supporting field and anti-aircraft artillery were also important means of combat with tanks, augmenting when necessary the purely antitank means. Mines were used in vast quantities, first by the German forces and later by all World War II armies which could obtain them. Large areas and long stretches of roads were covered with mines buried close enough together to cause heavy losses to tanks attempting to traverse the areas. The removal of mines was a major task for engineer and other troops.

Combat aviation was a powerful weapon against armoured forces in open country. The Russian armies made extensive use of aviation for this purpose as did the British and U.S. armies.

Chemicals.—Nontoxic chemicals, chiefly smoke, were used extensively to add the protection of reduced visibility for the enemy. The smoke was placed on the enemy troops making them unable to fire with any accuracy until the smoke cleared away. It could be kept dense by continuing to place it on the enemy. Smoke was a "deceptive device" generally used in offensive rather than defensive operations. Smoke was also used within friendly lines to cover troop movements, and to protect areas and sites from observation.

Anti-aircraft Defenses.—Defense of ground troops and ground installations and cities from air attack was carried out by defending air units, which attacked the hostile planes; and by large numbers of mobile and stationary anti-aircraft gun units formed in battalions and similar

units in the different armies. Ground combat troops also used such weapons of their own as were suitable against low-flying aeroplanes. Improved anti-aircraft gun techniques accounted for a large fraction of the aeroplanes brought down in every theatre of the war.

Special Operations and Aspects

Tactics for operations under special conditions were largely the application of the general attack and defense principles to those conditions.

Attack of Fortified Localities.-Whenever possible, fortified localities or positions were attacked by tactical air units in co-ordination with artillery preparations just prior to attack of the enemy position by ground or airborne troops. The Japanese captured the defenses of Singapore in 1942 from the rear. The German armies attempted to take Stalingrad by siege since they were unable to come at it from the rear. U.S. forces retook Corregidor early in 1945 by a combination of airborne and amphibious operations. Direct attack on fortified localities usually involved four phases: reducing the hostile outpost system to gain close contact; breaking through the fortifications at one or more favourable points; extending the gap by isolating and reducing the hostile positions on the flanks of the gap; and moving mobile reserves through the gap to complete the encirclement and isolation of the remaining fortifications while continuing the attack against them from the front. Air bombardment or action by airborne troops might precede these phases or might be a part of any one. Secrecy of preparation, thorough study of the special task to be accomplished based on detailed reconnaissance of the attack area, practice with special equipment for the purpose and careful planning were all important to success. The forces leading the attack were often specially selected and trained and usually included infantry, engineers, chemical troops and guns of high penetrating power.

Many operations began as amphibious operations against fortified localities, notably the 1944 landings in Normandy and those on Tarawa, Iwo Jima, Guam, Saipan and other fortified islands in the Pacific. Each such landing was carefully rehearsed, and many types of special equipment were involved, both in getting the troops to shore and in clearing the shore line of mines and obstacles, and in the attack on the fortifications. Preliminary naval and air bombardment was usual. During the assault heavy supporting fire or bombardment was concentrated on the hostile targets that were the greatest danger to the success of the attack, and especially on the enemy's armoured and other reserves to prevent them from reinforcing the positions being attacked. Operations were continued until the entire front selected for the major break-through was reduced and then the next phases of the attack followed at utmost speed.

·Attacks Across Rivers.—Attacks across river lines also required special equipment and detailed reconnaissance and study to determine the most favourable weak points in the hostile dispositions and the best spots for the construction of bridges. In both river attacks and landing from the sea, the first objective of the attacking forces was to capture an area (beachhead) of sufficient size to permit the safe landing of further troops and the organizing of further attacks on a progressively larger scale. In river crossings, if an existing bridge could be captured before the enemy destroyed it, the operation was greatly helped. The taking of the Remagen bridge on March 7, 1945, by the U.S. 9th armoured division enabled several divisions to make a rapid crossing, secure a bridgehead, and by securing the bridgehead greatly aid the corps of engineers in the construction of ponton bridges across the Rhine river

Night Combat.—There was much night fighting in World War II. Japanese forces made a specialty of infiltrating into U.S. lines at night, and in the early phases of the Pacific war the U.S. units tended to cease offensive action at nightfall and set up a "perimeter defense" against expected attacks. Later, well-planned U.S. night attacks against the Japanese were usually successful. An important phase of the British victory at El Alamein in North Africa in 1943 was carried out at night. The principles of night tactics were the selection of special men and units for specific tasks, simplicity of plan and thorough rehearsal. Complicated plans usually failed. Night attacks were used particularly to complete or exploit successes of the previous day, gain ground important for further operations, attract hostile reserves away from other uses and avoid the heavy losses of attacking over open ground by day. In all armies, river crossing operations were usually begun at night. Raids of small groups into enemy lines to get information and prisoners were common night operations. Many operations of large size were begun at night but required one or more days and nights to complete. Defense against night operations included the use of fire from machine guns and other weapons fixed to cover probable approaches, open ground and other areas of probable enemy use, and the use of obstacles and mines and illumination by flares and fires of the ground the enemy had to cross to attack. The use of outguards with night sentries was a normal means of night defense.

Fighting in Towns and Villages.-Fighting in towns and villages required special tactics applied by all armies. Attacks involved the use of small combat teams to enter the outer houses and then clean out the houses and buildings one by one and room by room with a technique making much use of hand grenades, explosives and short range automatic weapons. Tanks could be used for certain cooperating purposes but were at a disadvantage in towns well protected by antitank means. Air attack by bombing, except for the atomic bombs used late in the war, could not destroy a well-built city sufficiently to weaken the defensive forces within it seriously. Stalingrad and Cassino were examples. The heavy bombing created such rubble that towns were easier to defend and harder to take. Small towns and villages were sometimes by-passed and cleaned up later by troops following the leading elements of an attack. The defensive tactics used in towns were in general those used in other fortified localities.

Combat in Woods and Jungles.-Combat in woods is similar to combat in towns. Observation is difficult, as is control of troops. A large heavy woods with irregular ground is naturally a strong defensive area, and there were many such areas in most of the war theatres. The German defenses in the Hurtgen forest and other heavily wooded and hilly areas of France and Germany were most bitterly contested in 1944, and there were many jungle battles in the Pacific and China-Burma areas. Woods lend themselves to tactical traps and ambush. It was sometimes possible in the European operations to by-pass the smaller areas of woods, completely surround them and take the enemy forces within them later. In attacking a wooded area the edge of the woods was often the first objective, with a further attack organized and launched from that area. In defending a woods, the main defenses were not often placed in the edges, for these were clear-cut targets for artillery and air bombing. Woods were usually organized with a network of defensive positions closer together than on open ground, with observers and outposts in and near the edge of the woods and of clearings in the woods.

Jungle operations were made particularly difficult by lack of roads and trails, and by the heavy, tangled growth and the usual hot, wet climates. Observation was often limited to a few feet, and units had to take great care not to become isolated. Water routes were sometimes more useful than routes on land. Jungle manoeuvre consisted chiefly in painstaking movement to outflank encountered resistance. Such tactics required special training to produce resourceful fighting men who could use the jungles as an ally. Keeping to narrow roads and trails was often dangerous; hence troops had to be able to make progress through the heavy underbrush where routes often had to be cut. All-around defense against surprise attack, by day or night, was especially important in jungle warfare. In general, the lighter infantry and supporting weapons had greater use than the heavier because it was easier to move them. However, there was a considerable use of tanks in small groups fighting in close co-operation with infantry; and it was often necessary, against substantial jungle defenses which lightly equipped troops had been unable to reduce, to bring up the heavier weapons and equipment.

Mountain Operations.—The main effect of mountainous regions on tactics in World War II, as in previous wars, was simply to make operations slower because of the greater effort required. Many mountain areas required little or no special mountain-climbing equipment. Mountainous regions were fought over extensively in Burma-China, New Guinea, Okinawa, North Africa, Greece, Italy, France, Germany and soviet Russia. Mountains lent themselves to defensive warfare, as witness the long hard campaigns of the Allied armies in Italy during 1944–45.

In mountain combat the terrain limited the means commanders could use, and success depended more upon adaptation of available means to the terrain than upon their power. Surprise manoeuvres of the smaller combat units and initiative and leadership were of the highest importance. The seizing of heights from which fire could be concentrated on routes was an important general tactical problem, and offensive operations often resolved themselves into a number of well-defined attacks by subordinate units to seize a series or line of separate mountains.

Most of the armies of World War II had specially trained mountain troops with special light equipment and transportation, including pack animals. In the U.S. army there was one mountain division used in Italy. Lack of pack animals hampered the Allied forces operating in New Guinea in 1943, and in Burma and China, in the Chinese, British and U.S. forces, it proved necessary to build up pack-animal units to carry artillery, ammunition and supplies. Supporting air units were hampered in mountains by fog, clouds and wind currents, but bombing of routes was often very effective.

Combat in Snow and Extreme Cold.—Tactical operations in snow and cold demanded special equipment such as snow vehicles, white camouflage materials and extra warm clothing. The German-Russian winter operations were conducted in the most severe weather met by any of the armies. U.S. forces did no actual campaigning under true arctic conditions. Lack of proper cold-weather equipment caused many casualties among the German forces in Russia in the winter of 1941–42, in U.S. forces on Attu in 1943 and in Italy and France in 1944–45. Snow and cold often affected the mobility of motor equipment when full preparations for winter had not been made. The organization of defensive positions required special digging equipment and use of explosives.

Desert Warfare.—In World War II, the principal desert operations were those in North Africa between the British and first Italian and later German forces from 1941 to 1944. Water supply was always a chief concern in desert operations. The terrain was generally open, and either sandy or rocky. A number of desert movements made by both the British and Germans involved careful preparation for a surprise outflanking movement sweeping around at a distance from the hostile lines. Lack of roads and landmarks made it easy for troops to lose direction, and special attention to training in compass use was required. A high degree of mobility was always desirable in applying desert tactics, particularly because movements could be so readily detected from the air that speed was often vital to success.

Partisan Warfare.—Partisan-type warfare proved of considerable importance and usually took the form of surprise attacks by small forces, even groups of a few men, against isolated detachments and against the outer flank and rear units of main forces. In some phases of World War II, such operations were conducted by a great many small forces over a wide area. Partisan methods were especially effective against supply lines. Night was the usual time for partisan actions and much use was made of noiseless methods of combat such as strangulation and assault with knives. Defense against widespread partisan action was costly in use of troops for security detachments over large areas. Air action was sometimes effective against partisan-defended areas. A complete defense required a thorough combing over of large areas to find and clean out all partisan strongholds. Large as they were, none of the armies was

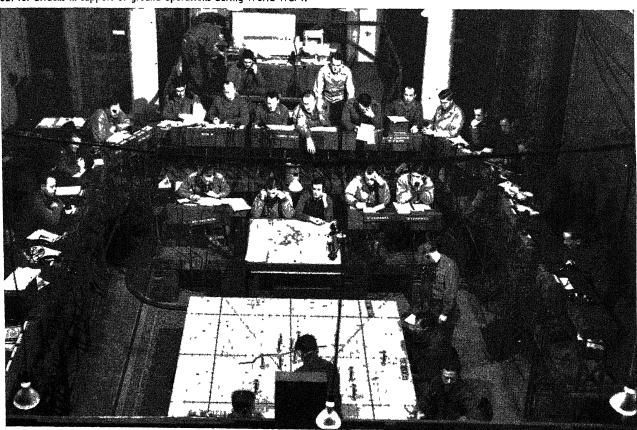

A tactical air command headquarters where targets were singled out for attacks in support of ground operations during World War II

large enough to accomplish this thoroughly except within areas of limited size. The Japanese forces in China, numbering many divisions, could not occupy completely even the areas their armies overran. The Japanese held the cities and towns, railways and roads, but could not move within other areas except in strength. Chinese partisan warfare was an important means of capturing weapons, ammunition and supplies; but this and other sources of the means of warfare were often insufficient to permit continuous partisan combat on a large scale.

Partisan methods were extensively used by the soviet forces in the great area overrun by the German armies in 1941–42. Their tactics for completely surrounded army units included use of partisan methods. In Yugoslavia the Germans were never able to blot out the partisan Chetnik and other forces, which eventually expanded to a considerable size and activity. In the Philippines and other Pacific regions, guerrilla action continued throughout the period of Japanese occupation. In France, the underground Maquis workers took up active partisan warfare in co-operation with the Allied landing forces.

After the remnant of the British expeditionary force to France was evacuated at Dunkirk in 1940, training in partisan tactics became widespread in Britain. Invasion was expected before there would be time to build up the British army, and preparations were begun to make the invasion as costly as possible through home-guard partisan tactics. (See also Guerrilla Warfare.)

Commando, Ranger and Raider Tactics.—The tactics used by picked and highly organized forces such as the British commandos (q.v.) in the raids on Norway and Dieppe, the U.S. army rangers in North Africa, Sicily, Italy and Normandy, and the U.S. marine corps raiders in early Pacific operations, were essentially night infantry tactics. The units received more intensive training than it was pos-

sible to give the rest of the combat forces. Operations were planned in great detail and rehearsed many times. Nearly all such units were disbanded by early 1944 because of their adverse effect on combat units in general which had equally difficult fighting to do. The colourful commando units received much special acclaim not received by the others and took too many of the best men from other combat units.

Airborne Tactics.—The airborne developments of World War II were highly important. With airborne forces operating in conjunction with ground forces, a commander could attack the enemy's rear by "vertical envelopment." Perhaps the most important general principle, however, of airborne operation was that such forces must not be thrown into battle too far from other forces attacking the same hostile force by ground routes. Isolated airborne units had to be supplied by air with food and ammunition for continuous operations. Three to five days was considered the maximum time airborne units could operate without a linking up and relief by ground forces.

In an airborne operation, the first troops dropped were parachute infantry with artillery and other supporting units. These were necessarily spread over an area of some size, and were required therefore to assemble speedily into organized fighting units. The first attack objective normally included an airfield or other suitable spot for glider and aeroplane landings where supporting glider infantry could land, and, later, aeroplanes with reinforcing supplies and troops.

Tactical Air Units

Combat air units were divided into strategic and tactical. The strategic air forces carried out long-distance bombing operations. Tactical air forces worked closely with the ground forces on close support missions. (See AVIATION, MILITARY; STRATEGIC BOMBING.)

In their early campaigns of 1939 to 1942, the German ground forces were heavily supported by dive bombers and other planes which attacked ground forces effectively from low altitudes. But against determined and experienced troops, well equipped with anti-aircraft weapons, these tactics proved to be so costly that they were generally avoided except when the hoped-for accomplishment was believed to be worth the probable cost. Hence much tactical bombing in support of ground troops was done from medium rather than extremely low altitudes. Strategic air forces were sometimes given tactical missions, for example, in augmenting the air support of the D-day landings.

Tactical air operations in offensive warfare consisted in part of close and immediate co-operation in support of front-line troops. There was by no means an "air umbrella" over every part of an attacking ground force as it was often popularly believed. An important use of tactical air units was for pin-point bombing and strafing of enemy positions prior to ground attack, and after the attack began, against hostile targets some distance from the ground forces. The destruction in the air and on the ground of hostile air units which attempted to interfere with an offensive operation was a primary mission of all tactical air forces. Air success in this regard was usually so important that when such air action was delayed by weather or other cause, large ground actions were often postponed. Air attacks to slow up the movement of hostile reserves and destroy lines of communications were also missions of great assistance to ground forces. The air superiority gained and held by the Allies over Germany from 1944 on, through the action of both strategic and tactical air forces, contributed much to the successful invasion of France and defeat of the German forces, especially through hindering the movement of German reserves. Similarly, in the Pacific, destruction of Japanese air forces by U.S. air units of the army and navy, and of Japanese shipping by air and naval forces, not only prevented reinforcement of island garrisons but enabled U.S. ships and planes to assist the landing forces freely through preliminary bombardment and later tactical co-operation. And from D-day on in Europe, the large tactical air forces which were available greatly augmented the artillery fire power in preparing break-throughs of ground forces, and were of immeasurable assistance to the rapidly moving ground forces exploiting a successful break-through. Such action was particularly effective during the German retreat after the break-through at St. Lô and the crossing of the Rhine.

In the Allied forces, a tactical "air command" composed of medium bombardment, fighter-bomber, reconnaissance and other air groups, operated in close conjunction with each of the armies. Co-operation missions were jointly planned by the commander of the army and the commander of the tactical air command working with that army. Taft, Robert Alphonso

Taft (1889—), U.S. senator, was born Sept. 8, 1889, in Cincinnati, O. Son of William Howard Taft, 27th president of the U.S. he received his B.A. degree from Yale in 1910 and his LL.B. from Harvard in 1913. After completing his studies, he began the practice of law and also entered politics in Cincinnati as a precinct worker. He served during World War I as assistant counsel on the U.S. food administration. Elected to the Ohio house of representatives in 1921, he served three terms and was a member of the Ohio senate, 1931–32.

In 1938 he was elected to the U.S. senate and two years later (1940) Ohio Republicans boosted him for the presidential nomination, but he lost to Wendell Willkie. In 1944 Taft again loomed as a possibility for the presidential nomination, but the convention chose Gov. Thomas Dewey. Meanwhile, Taft gradually took a dominant position among G.O.P. members in the senate.

Committed to a stand of nonintervention before Pearl Harbor, Taft voted against Dumbarton Oaks, the Bretton Woods agreement and the Reciprocal Trade Acts agreement and on Dec. 4, 1945, he was one of the seven senators who voted against U.S. participation in the United Nations. He also assailed the proposed \$3,750,000,000 loan to Britain and suggested (April 24, 1946) that Britain be given an outright gift of \$1,250,000,000 instead. With regard to the soviet union, he felt that Pres. Harry S. Truman's administration was "appeasing" that country and thereby building it into "the greatest totalitarian state the world has ever known."

In domestic policy, he based most of his attacks against New Deal legislation on what he called the government's tendency to take more and more control over the nation's economy, thereby threatening the structure of private enterprise.

After the Republican victory in the elections of Nov. 1946, Taft was once more considered as a potential presidential candidate.

Talc

The United States remained the world's largest producer of talc minerals—talc, pyrophyllite and soapstone. Next in importance came Manchuria, Italy, Norway, India, Canada and Spain, with outputs of the order of 100,000 tons down to 20,000 tons, which combined to make a total somewhat less than that of the United States. A number of other countries had smaller outputs, with production data so incomplete that no estimate could be made of the world total.

The salient features of the industry in the United States are indicated by the following data in thousands of short tons:

													1937	1939	1941	1943	1945
Mine produc	tio	n										,	2	2	414.5	436.2	401.2
Sales													230.0	254.0	416.4	412.9	401.1
Crude .													11.1	1 <i>5.7</i>	43.8	30.2	39.3
Sawed .													1.1	1.9	4.2	1.7	2.6
Ground													217.8	236.4	368.4	381.0	359.2
Imports			*6	٠		٠			٠	٠			26.9	26.2	18.6	6.6	8,5
Used in																	
Paint .						٠							59.7	67.9	120.3	129.2	96.5
Paper .				٠						٠			32.1	30.2	37.9	34.4	27.1
Ceramics													29.8	38.4	79.0	47.9	34.3
Rubber .													26.9	31.1	58.1	49.0	62.0
Roofing													23.6	30.5	40.6	47.5	46.2
Toilet pre													4.3	9.7	21.1	17.7	19.0
Insecticide	es	٠	٠	•	٠	٠	٠	٠	•	•	•	٠	ş	ŝ	10.3	24.5	3 <i>5.7</i>

In addition to the increased uses shown in the table, unspecified uses expanded greatly, since this group included various important war uses in the chemical warfare service and as an insulator in electrical equipment, especially for radio communication.

Full data were available from Canada only after 1941, when the total was 34,632 tons; succeeding years showed 29,868 tons in 1942, 26,163 tons in 1943, 32,597 tons in

1944 and 26,889 tons in 1945. In general, the total output was divided about evenly between talc and soapstone.

The Italian output increased from 51,200 short tons in 1937 to 90,117 tons in 1942, and the Indian from 14,830 tons in 1937 to 36,133 tons in 1942, declining to 18,731 tons in 1943.

Tangier

An international territory, Tangier is one of the zones of Morocco, its legislative power being vested in an international assembly following the convention of Paris of Dec. 18, 1923. The regime is autonomous, under the nominal sovereignty of the sultan of Morocco. The sultan's representative (the mendoub) during the decade was Hadj Mohammed el Tazi. Area: 232 sq.mi.; pop. (1940 census, 102,306) (1941 est.) 100,000 (36,500 Moslems, 16,509 Europeans). Languages: French, Spanish, Arabic.

* * *

In May 1936 it had been agreed that the office of administrator in the international zone should be held for three years alternatively by a Frenchman and a Spaniard, and that a Spaniard should hold it first. The Spanish Civil War, however, supervening, the French administrator's term was extended. With France's collapse and Italy's entry into World War II, Tangier became front-page news. On June 14, 1940, Spain assumed sole control there. Since three of the four guaranteeing powers (Britain, France, Italy and Spain) were at war with each other, this proceeding was in itself perfectly normal. But newspaper headlines, demonstrations and rejoicings throughout Spain proclaimed that Tangier, "now Spanish," was to be "the gateway to the Spanish empire," and on Nov. 3, 1940, Colonel José Yuste, who had entered the zone with Moorish soldiers in June, proclaimed himself governor, announced that the charter of internationalization (1923) was annulled and dissolved the legislative assembly. This step having violated an international agreement, Britain, which with France, had concurred in the action of June, made a formal protest and reserved its position with regard to an ultimate settlement. Compensation described in the house of commons as "generous" was offered by Spain to British officials displaced by the annexation, and the rights of British nationals, together with the continuance of British institutions, were guaranteed; Spain also undertook that the zone would not be fortified.

During the five years' occupation, plans were made by Spain for the amelioration of the zone, but next to nothing was accomplished, the price paid by it for the advantage of neutrality being Spanish forms of government, the substitution of Spanish for international police and the introduction of the black market. In Jan. 1943 Tangier was formally incorporated in Spanish Morocco and the khalifa of Spanish Morocco, Sidi Muley Hassen Ben el Mehedi, made a ceremonial entry into the city. In Aug. 1945, after the defeat of Germany, a conference was held in Paris, between representatives of Britain, France, the U.S.S.R. and the United States. On Sept. 4, 1945, Spain was called upon to evacuate Tangier; the sovereign rights of the sultan of Morocco were re-established; the international administration of 1923, as modified in 1928, was restored; and the U.S.S.R. and the U.S. were invited to collaborate in this

administration. These decisions were to remain in force until the conclusion of a fresh convention between the powers signatory to the act of Algeciras, among which was Spain.

The Spanish government complied with the demands of the powers, an official statement from its foreign ministry (Sept. 18) alleging that the zone had been occupied only to forestall a possible axis attack upon it. The diplomatic and consular representatives of the powers in Tangier met there and agreed to reinstate a Frenchman, Joseph le Fur, as temporary administrator for the Allied control commission, to be succeeded by a Portuguese. The Spanish undersecretary of foreign affairs, Don Cristóbal Castillo, was appointed Spanish consul-general. On Oct. 11, 1945, the 80year old mendoub, representative of the sultan of Morocco, returned to Tangier in a French cruiser, which also brought a new garrison, and, in the sultan's name, thanked the United Nations for restoring his rights. Among the earliest reforms instituted under the new regime was the creation of an assistant administratorship of native affairs, so that problems of government might more adequately be studied before the meeting of the signatory powers to discuss the forthcoming charter. (E. A. P.)

Tantalum

The production of tantalum ores in the United States continued small, reaching a high of only 9,411 lb. in 1943, and declining to 5,500 lb. in 1945. The relatively large amounts used in the United States came mostly from imports, which were as follows, in thousands of pounds:

1937		1940	490.5		643.1
1938			403.5		837.1
1939	56.6	1942	467.5	1945	630.1

In earlier years, the bulk of the supply went into electronic tubes. The other most important use of the metal was in chemical equipment resistant to acid corrosion, especially by hydrochloric and acetic acids. Tantalum received a considerable amount of publicity during World War II as a bone repair material in surgery, and in surgical and dental instruments, though the amounts thus consumed were relatively small. In compound form, the fluoride was used as a catalyst in the manufacture of the butadiene type of synthetic rubber, and the oxide and some

other compounds were used as phosphors in the coating of fluorescent lights. The carbide, exceedingly hard, was used in cutting tools, wire-drawing dies and parts requiring high hardness and resistance to abrasion. (G. A. Ro.)

Tariffs

The world emerged from the decade 1937-46 with substantially the same tariff systems as those employed at the beginning of that period. Although numerous duties had been changed for individual items in the import classifications of various countries, these changes were of minor importance insofar as they affected the general character of the tariff systems of the major trading nations. The foregoing statement applies with almost equal validity to both the revenue positions and the protective role of these systems. It may be somewhat misleading, however, to make the above generalization without setting it in its proper perspective. However correct it may be that tariffs in 1946 differed little from those in 1937, it should be borne in mind that the economic and political environment was altered materially during the decade. Customs duties were to function against a new and different background of international trade, world finance, political organization and programs for world collaboration; this altered environment in turn could be expected to affect both the importance and the status of tariffs in the commercial policies and revenue systems of the world.

For several decades, the importance of import duties in the fiscal systems of many countries had declined. Similarly, even their importance as an instrument of commercial policy (that is, their employment for the protection of domestic industries and for the benefit of special interest groups) had waned with the increased use of other devices such as nontariff controls over imports, state trading, bilateral agreements, export controls and the like. The global character of World War II, involving extensive preparations by the aggressor nations and, later, by the Allied Powers, the vast operations of the war itself and the comprehensive measures undertaken to prevent postwar disorganization, induced many countries to resort to nontariff import and export controls on a scale incomparable to anything imagined in the nontotalitarian countries during the prewar decade. As a consequence, therefore, tariffs were eclipsed by the wartime trading policies of most countries.

The generalization that the world emerged from the war with substantially the same tariff systems as before must also be interpreted in the light of aspirations and programs (discussed later in this article) of the United Nations to remove the many barriers which had served as continuing restrictions on the volume of world trade. These plans for liberalizing trade constituted the basis for a wider degree of multilateral trading and served to replace the autarchic and bilateral practices of the prewar decade.

Tariff Systems at the Beginning of the Decade.—The national tariff systems in force at the beginning of the decade 1937–46 were in large part the products of events which occurred during the interwar period. So far as

tariffs were concerned, these events could be grouped around three rather distinct trends: (1) the general intensification of protectionism during the late '20s and the '30s; (2) the rise of autarchic-bilateralism as practised principally by the later aggressor nations and (3) the development of the reciprocal trade agreements program by the United States.

Sharply contrasting with the objectives of various programs instituted by the League of Nations to achieve greater freedom in the international exchange of merchandise was the rise of economic nationalism after the close of World War I. Even before the depression of the '30s, many countries had begun to vie with one another in raising tariff barriers and granting protective duties. Economic nationalism was given additional impetus by the newly created European states which desired to integrate their economies behind new boundaries. Other countries, beset by inflation, shortages of exchange or unemployment, sought to fortify their economies by the erection of tariff walls. Only the more stable of the European countries, particularly those which were neutral during World War I, found it expedient to pursue moderate tariff policies. In 1922 the United States, by then the world's chief creditor nation, sharply increased the level of its tariff. Heinrich Liepmann estimated that by 1927 the chief European countries had increased the height of their tariffs to about double that prevailing in 1913.1

The depression following 1929 gave further impetus to the erection of tariff barriers. In 1930 the United States intensified its policy of protection by increasing substantially the rates of duty on hundreds of import items. This action was followed almost immediately by sharp increases in the tariffs of many other countries. In a short while Great Britain found it necessary to abandon the gold standard and to reverse its traditional position as the leading exponent of free trade. Later, a system of empire preferences was worked out at Ottawa, Canada.

It had become increasingly difficult to consider tariffs without referring to a wide variety of complementary instruments of commercial policy. These instruments had been colourfully characterized as follows by Pres. Herbert Hoover: "Mainly out of currency instability and currency manipulations and planned economy there have grown unreasonable tariff walls, embargoes, quotas, subsidies on exports, discriminations between nations. They are all devilish devices which create scarcity and restrict world prosperity." To the list might well have been added compensation, clearing and payment agreements, exchange control and the "invisible tariff," by means of which governments extended indirect administrative protection through application of cumbersome customs formalities and regulations. During the interwar period nontariff controls over imports had become an important aspect of the international system of regulation and had contributed materially to the breakdown of the world trading system. Despite the importance of these auxiliary devices for restricting imports at the beginning of the decade 1937-46, however, the tariff continued to be the most prominent instrument of commercial policy in countries other than the totalitarian states.

By 1937 two rather carefully articulated programs of world trading were competing with one another. These systems were designated as the autarchic-bilateralism practised by such countries as Germany and Italy, and the reciprocal trade program of the United States. The first method, employed chiefly by the totalitarian states for the thoroughgoing regulation of trade, constituted leadership in the direction of more aggressive economic nationalism. It utilized quotas and other nontariff import controls, tariff discriminations and exchange control, and made extensive use of the many instruments of bilateralism, including compensation, clearing and payment agreements. Because of the vulnerability of their economies, many smaller countries were drawn into the orbit of the German trading system.

In 1934 while the new and discriminatory trade restrictions were being employed by the aggressor nations in preparation for war, the United States launched its reciprocal trade program. It was directed to the restoration of multilateral trade, and its cornerstone was "the principle of equality of treatment." The United States congress authorized the president to negotiate trade agreements with foreign countries and, in return for concessions by such countries, to grant reductions in duties on imports into the United States. All reductions thus granted were extended on an unrestricted unlimited most-favourednation basis to all countries not discriminating against United States products. The objective of the reciprocal trade program was that of contribution to a general liberalization and revival of world trade. By the close of 1937 the United States had negotiated most-favoured-nation agreements with 16 countries and had, thereby, exchanged reciprocal concessions providing for lower tariffs and modifying other restrictions on imports.

The Prewar Years.—During the three-year period 1937-39, the dictator nations of Europe were preoccupied with the program which eventuated in war and conquest. Meanwhile, other countries became increasingly concerned over problems of defense and consequently the commercial policies of all nations reflected the new war atmosphere. Efforts were generally directed to the achievement of a greater degree of self-sufficiency, the acquisition of essential materials and the elimination of nonessential imports. Tariffs did not readily adapt themselves to the new objectives. Thus, although import duties continued in many countries to be the most important method of trade control until the outbreak of the war, they lost ground relative to other types of restriction. More extensive use was made of quotas, licensing systems, bilateral balancing arrangements, export embargoes and state trading.

The multilateral system of international trading continued to be under attack by the German program of bilateralism, while at the same time the United States continued the attempt to revitalize multilateralism through the media of its reciprocal trade program. The German system, preliminary to its ultimate collapse, approached its zenith during this period, but, as before, the chief instruments of policy were nontariff controls over trade, including an intricately articulated system of exchange control, blocked accounts, barter transactions and highly elaborated clearing and payments agreements.

Probably the outstanding development in the field of tariffs during the years immediately before World War II was expansion by the United States of its reciprocal trade program. In addition to those already in force, new agreements were negotiated with Czechoslovakia, Ecuador, the United Kingdom, Turkey and Venezuela, and supplementary agreements were concluded with Canada and Cuba. In all of these negotiations, the agreement countries granted, on a most-favoured-nation basis, numerous concessions on United States exports in return for tariff concessions on imports of their products into the U.S.A.

¹Tariff Levels and the Economic Unity of Europe (London, 1938).

During the period 1937-39 no country undertook a major revision of its import tariff. Moreover, an analysis of the more important changes which did occur reveals no discernible trend; possibly the tendency, if it may be called one, was in the direction of higher tariffs. Many changes were piece-meal and made no significant alteration in the tariff policy of the various individual countries; others were somewhat more substantial. In 1937 the United Kingdom, in a trade agreement with Canada, granted reductions to the latter country on a variety of products. In the same year duties were lowered on various iron and steel items. In 1939 the United Kingdom negotiated an agreement with Eire by which the two countries exchanged various reciprocal reductions in duties on each other's products. The earlier duties on iron and steel products were restored in that year, however, when the protective system was further elaborated by increasing the tariff on various imports including mineral oils.

In the trade agreement mentioned above, Canada in 1937 reduced its preferential duties on about 150 items from the United Kingdom. During the same year the system of imperial preference was strengthened by new agreements in which Canada granted additional preferential reductions to Australia and New Zealand. France increased all customs duties by about 13% in 1937 and also raised the levy on a variety of individual import items. Additional increases by Eire in 1938 served to make that country's tariff structure one of the highest in the world. During these three years Belgium, the Netherlands and Sweden were about the only other countries of Europe which may be said to have increased their customs duties on any substantial list of items. Outside of Europe, perhaps the most extensive change was that by Australia, which in 1937 reduced duties on a wide variety of imports, including iron pipes, sanitary ware and tiles. Although Australia reduced its tariff on a few items in 1938, duties on many others were increased during the following year. Few changes were made in the tariffs of Latin American countries. In 1938 Bolivia, in order to compensate for currency depreciation, imposed an additional surcharge on all imports. In the same year Brazil levied a much smaller surtax on imports into that country. In 1937 Ecuador increased the basic rates of duty on more than 300 commodities, as did Mexico on most of the items in its tariff schedule. In 1938 further increases, subsequently modified, were imposed on more than 200 additional import items in the Mexican schedule.

The War Period.—Because of the exigencies of World War II, customs tariffs were employed less as instruments of commercial policy during the period 1940-44 than perhaps during any comparable period in the preceding quarter century. Although prewar schedules of import duties were generally maintained, at least in form, they had less effective application during the war than before. There were scattered instances where governments increased or imposed new protective duties to foster selected industries, but these increases were scarcely representative of the war period. From time to time, also, a few nations increased their tariffs on a substantial variety of items solely for revenue purposes. Still others, such as Peru in 1940, had recourse to higher duties as a wartime measure of indirect exchange control by means of restricting the importation of nonessential items. More representative of the war period, however, was the fact that many nonbelligerent countries, impelled by the need for industrial equipment, raw materials and prime essentials, frequently sought to protect their economies by granting at least temporary exemptions or reductions in duties. Because of wartime scarcities of essential materials, the closing of important sources of supply and the blockade of others, the shortage of shipping and the greatly increased demand for strategic materials, some countries suspended temporarily the application of duties on commodities essential to the prosecution of the war.

By and large, however, the war constituted a standstill period as far as tariffs and related instruments of commercial policy were concerned. There were virtually no complete revisions or extensive modifications of tariff schedules throughout the world. Perhaps the closest to such revisions were the changes made in Bolivia and Uruguay. In 1940 Bolivia adopted a new customs classification based on the Brussels International nomenclature, and, during the three years which followed, Uruguay revised its tariff schedule more or less in accordance with the recommendations of the League of Nations committee on tariff nomenclature. It is interesting to note, however, that the new schedules in each of these countries left the prevailing rates of duty relatively unaltered.

Although import duties continued to be the mainstay of the revenue systems of many nonindustrialized nations during World War II, nontariff controls overshadowed the various national tariff systems as instruments of control over world trade. The war served to substitute a struggle for imports for the former neomercantilistic struggle for exports; it resulted also in the coinage of new slogans such as that in Turkey, where the proverbial "We buy from those who buy from us" was replaced by "We sell to those who sell to us." Almost immediately after the outbreak of the war in 1939 there was a rapid extension of control over trade in most neutral countries. There followed a widespread introduction of embargoes and licensing systems for the restriction of exports, particularly of foodstuffs, essential raw materials and industrial supplies. The belligerent powers, of course, administered increasingly tight systems of control over all aspects of foreign trade. Thus, the eclipse of tariffs became quite complete as production priorities, export licensing, shipping allocations, import permits, blocked exchange balances and state trading were employed on a wholesale scale as instruments of global warfare. The wartime subordination of the tariff was succinctly portrayed in the following remarks by the Canadian minister of finance in his budget speech of 1943:

The customs tariff has fallen from the high position it has previously held as an instrument of fiscal and economic policy. Under the circumstances of war, the tariff has little effect except as a producer of revenue. The scope and direction of trade are now governed by the consideration of supply, transportation and enemy action. . . . Under these circumstances, changes in the customs tariff . . . are of no effect in expanding or curtailing trade.

Each of the major belligerent powers, of course, elaborated its own system of control to conserve essential supplies, promote the importation of strategic materials and prevent supplies from reaching the enemy. Nonbelligerent countries found themselves obliged to adopt similar programs in the interests of their own national economies. As one of the belligerent powers, for example, the United Kingdom instituted a system of selective control over exports through the requirement of licences. The British government negotiated many bulk purchasing agreements for foodstuffs and other vital materials. To allocate shipping space, to eliminate nonessential imports and to conserve exchange balances, an import licensing system was also applied soon after the outbreak of World

War II. Gradually the British wartime system of exchange control, designed to conserve the available free exchange balances, resulted in the blocking of millions of pounds sterling and entailed a large degree of bilateralism within the sterling area. This bilateralism resulted chiefly from the fact that the owners of the blocked balances could use their funds only to buy imports from the sterling area, principally the United Kingdom, whose import transactions had created the balance in the first place.

Although there were no over-all revisions of tariff schedules in any major country during the war, there were many piecemeal modifications, usually relatively unimportant, either raising or lowering the rates of duty for specified import items. For the most part these scattered changes displayed no decided pattern or trend; modifications providing for lower rates of duty, however, were apparently more numerous and of somewhat greater importance than those providing for increased import charges. Only the more salient of these changes will be mentioned. As the war progressed, Canada tended more and more, because of its exchange position, to favour imports from the United Kingdom. This was achieved, in part, by lowering the preferential duties on products imported from the United Kingdom. In 1941 Canada cut in half most of the duties on British products; further reductions were made in 1944. A different trend was apparent in Egypt, however, where duties levied on a specific basis were doubled in 1941. In Latin America, wartime shortages of supply induced several countries to reduce or suspend, at least temporarily, the duties on many prime necessities; such action was most apparent in Argentina, Brazil, Chile and Venezuela. Rather extensive increases in duty were imposed, on the other hand, in Cuba, Ecuador, Mexico, Paraguay, Peru and Uruguay.

Despite the onset of the war, the United States pressed its efforts to promote a more liberal basis for world trade. Not only were new trade agreements negotiated but the legal basis of the program itself was also broadened. In 1945 the congress of the United States authorized the president to continue the program of negotiating reciprocal, unconditional most-favoured-nation commercial agreements with other countries and to grant mutual concessions therein; moreover, it liberalized the terms under which such concessions could be granted. During the period 1940-46, inclusive, additional most-favoured-nation agreements involving reciprocal tariff concessions were negotiated between the United States and Argentina, Peru, Uruguay, Mexico, Iran, Iceland and Paraguay; supplemental agreements were concluded with Canada and Cuba.

Postwar Plans and Projects .- Perhaps the decade ending in 1946 would ultimately be characterized not as an interval during which tariffs were eclipsed, momentarily at least, by other devices for controlling world trade, but as a memorable transition period between the neomercantilistic bilateralism of the '20s and '30s and a new epoch of multilateral trading among nations. Although it would be premature in this summary to render such a judgment, it is highly pertinent to an appraisal of trends during the decade to record the fact that a great deal of thinking and planning was devoted to the problem of liberalizing commercial policies throughout the world. By 1946 these aspirations had progressed beyond the early stages of discussion and debate and had become the subject of international negotiation and formal commitment. Although the superstructure had not been elaborated, the foundation perhaps had been laid for a broader and freer exchange of goods and services among nations.

For many years there had developed among statesmen, a growing consciousness that autarchic and bilateral trade devices strangled commerce, impoverished peoples and created international ill will. The instrumentalities of economic warfare to which nations had had recourse included heightened tariffs, embargoes, quotas, exchange controls, multiple currencies, export subsidies and bilateral agreements. These in turn frequently set in motion spirals of retaliation and counterretaliation. During the decade ending in 1946, therefore, various proposals were advanced to reduce or eliminate trade barriers and to lay the basis of a wider multilateralism which in turn was expected to promote world prosperity and facilitate the maintenance of peace. The more important steps designed to reconstruct world trade included the signing of the Atlantic charter, the Lend-Lease agreements, the Bretton Woods program and the proposal for an international conference on trade and employment.

The Atlantic Charter.—In Aug. 1941, even before the entrance of the United States into the war, the prime minister of the United Kingdom and the president of the United States issued a joint declaration setting forth "certain common principles in the national policies of their respective countries on which they base their hopes for a better future for the world." Two of the pledges made in this renowned document, the Atlantic charter (q.v.), committed the two countries to liberal trading policies:

Fourth, they will endeavor, with due respect for their existing obligations to further the enjoyment by all States, great or small, victor or vanquished, of access, on equal terms, to the trade and to the raw materials of the world which are needed for their economic prosperity;

Fifth, they desire to bring about the fullest collaboration between all nations in the economic field with the object of securing, for all, improved labor standards, economic advancement and social security.

Article VII of The Master Lend-Lease Agreement.—The next important declaration of intention to work for a broader program of economic collaboration and for the elimination of world trade barriers was embodied in the master Lend-Lease agreement, signed between the United States and other members of the United Nations. Article VII of the Lend-Lease agreement between the United States and the United Kingdom, signed in Feb. 1942, read as follows:

In the final determination of the benefits to be provided ... the terms and conditions thereof shall be such as not to burden commerce between the two countries, but to promote mutually advantageous economic relations between them and the betterment of world-wide economic relations. To that end, they shall include provision for agreed action ... directed to the expansion, by appropriate international and domestic measures, of production, employment, and the exchange and consumption of goods, which are the material foundations of the liberty and welfare of all peoples; to the elimination of all forms of discriminatory treatment in international commerce, and to the reduction of tariffs and other trade barriers; and, in general, to the attainment of all the economic objectives set forth in the Joint Declaration (Atlantic Charter) made on August 12, 1941, by the President of the United States of America and the Prime Minister of the United Kingdom.

At an early convenient date, conversations shall be begun between the two Governments with a view to determining, in the light of governing economic conditions, the best means of attaining the above-stated objectives by their own agreed action and of seeking the agreed action of other like-minded Governments.

International Monetary Fund; World Bank.-The first

important measures to implement the objectives of the Atlantic charter and Article VII of the mutual-aid agreements were products of the United Nations Monetary and Financial conference which met at Bretton Woods, N.H., in July 1944. As a result of the Bretton Woods proposals, two agencies for international economic collaboration began initial operations in Dec. 1945; these were the International Monetary fund and the International Bank for Reconstruction and Development (qq.v.).

The International Monetary fund was designed to eliminate the various currency and foreign-exchange dishculties which obstructed world trade during the interwar period. Previously, widely fluctuating exchange rates, competitive depreciation of currencies, exchange allocations and preferential exchange treatment had all served as barriers to the free flow of commerce and mutual prosperity among nations. Some countries had instituted exchange control reluctantly during the depression to stabilize their currencies or to prevent further disruption of their national economies; others had used exchange regulation as an instrument of a carefully articulated program of economic aggression and still others had recourse to such controls more or less helplessly as they were caught in a world tide of economic bilateralism.

The Monetary fund constituted an agreement among nations to assist one another in reducing or avoiding monetary disturbances and provided the machinery, so far as possible, to make the currencies of its members freely convertible. Member countries undertook through the fund to keep their exchange rates as stable as possible and to alter rates only in accordance with carefully designed rules of procedure. A common pool of monetary resources was established to meet temporary shortages of exchange and to assist member countries to weather an emergency.

The resources of the Monetary fund were not available, of course, to finance capital investment and long-term transactions. Hence, a companion institution came into being after Bretton Woods to render such assistance to nations. The International Bank for Reconstruction and Development had an authorized capital of \$10,000,000,000, subscribed by the member countries. Subject to the provisions of its carefully drawn article of agreement, the bank was in a position to promote the postwar rehabilitation of nations and to further their orderly economic development thereafter.

The Anglo-American Trade and Financial Agreement. -In 1946 a financial agreement was negotiated by which the United States extended a line of credit (\$3,750,000,-000) to assist the United Kingdom in the rehabilitation of its economy. At this time both countries agreed to support a broad program for the relaxation of trade barriers. Indeed, one announced purpose of the loan to Britain was that it would permit that country to make a more rapid transition to multilateral trading; the loan would thus enable the United Kingdom to remove exchange controls on current accounts, open up the so-called sterling area by permitting nations within the system to trade freely with other countries and eliminate quantitative import restrictions. Commitments covering all of these matters were embodied in the Anglo-U.S. agreement, which thereby served to facilitate the restoration of world trade on a multilateral, nonrestrictive and nondiscriminatory basis.

International Trade Organization.—Despite the measures of international economic collaboration outlined

above, much remained to be done at the close of 1946 to achieve full implementation of the objectives of the charter insofar as international commercial policies were concerned. The Bretton Woods program was designed chiefly to promote world monetary stability and to assist in postwar economic reconstruction and development. There was still need for more direct action to eliminate trade barriers and to establish "rules of the game" to achieve international collaboration on a multilateral trading basis.

In Feb. 1946, the Economic and Social council of the United Nations adopted a resolution calling for an international conference to consider the creation of an International Trade organization (I.T.O.). It also created a preparatory committee of 19 nations to arrange for the conference, to draft the agenda for its deliberations and to prepare a draft charter for the proposed organization. When the preparatory committee met in London in Oct. 1946, the United States delegates brought with them a proposal for co-operative action (Proposals for Expansion of World Trade and Employment) to break down trade barriers and expand world trade. This draft, suggesting the possible character of the I.T.O. charter, embodied a code of international trading principles and suggested that the organization should constitute an agreement among the signatory powers:

- To reduce trade restrictions and discriminations imposed by governments;
- (2.) To eliminate restrictions on trade imposed by private business groups;
- (3.) To prevent, by intergovernmental action, disorder in the markets for certain primary commodities;
- (1.) To seek full employment by co-operative rather than conflicting nationalistic measures which in the past failed to accomplish their employment objectives and further restricted international commerce;
- (5.) To establish an international organization—the International Trade organization—to administer the world trade charter and to provide an effective forum for later negotiation of problems of international commerce.

The various postwar projects and plans outlined above had far-reaching potentialities for the trade of the world. The basis for co-operative action among states had been laid so that restrictive trade practices might be eliminated. In anticipation of the actual signing of the charter of the new International Trade organization, the United States, in Nov. 1946, announced its intention to pursue still further its reciprocal trade agreements program by negotiating on a scale much more comprehensive than previously. The United States indicated that early in 1947 it would negotiate simultaneously with 18 leading trading nations and that it would seek most-favoured-nation agreements providing reciprocal reductions in tariff duties and modifications of other barriers. It was also suggested that should these negotiations prove successful, multilateral concessions among the other negotiating countries might be agreed upon to facilitate a general reduction of trade barriers throughout the world.

The various efforts toward international collaboration to establish more liberal trading practices were impeded, of course, by the same social forces which during the interwar period contributed to the break-down of the world trading system. In many countries, those economic interest groups, which were, or believed themselves to be, the beneficiaries of trade restrictions, indicated their

staunch opposition to the projects outlined above for eliminating trade barriers. Moreover, by the close of the war a substantial number of countries, including a few in Latin America, indicated that they intended to employ protective duties or related controls (especially import and exchange controls) to preserve or expand a variety of war-born industries. Perhaps the major contradictory trend was the manifestation of an increasing expectation by citizens in the principal industrial countries that governments would intervene in economic affairs to prevent social disorganization, to stabilize the national economies and to assure some measure of full employment. This, of course, was the motive for exchange and import controls in many countries during the 'gos; it served also as a rationale of the autarkic practices by the aggressive totalitarian states and it was the purpose of commodity control schemes (e.g., those for sugar, wool and wheat) adopted by other countries. The victory of the British Labour party in the election of 1946 was in part a dynamic illustration of this point of view. International trade restrictions, state trading and commodity control programs thus came to be regarded in various quarters as means by which nations might insulate or protect themselves from the hazards and shocks generated in other countries. Thus, at the close of 1946 there were substantial forces resisting the program for multilateralism in world trade. (See also Inter-NATIONAL TRADE.)

Tasmania

One of the six states of the commonwealth of Australia, Tasmania is an island situated 140 mi. south of the east corner of the continent of Australia. Area: including sundry small islands, 26,215 sq.mi.; pop. (1937 est.) 232,-693; (1946 census) 251,260 (99% of British origin). Chief towns: Hobart (cap.) in south (pop. 10,838, 1943) and Launceston in north (35,785). Language: English. Religion: Church of England 54%, Roman Catholic 17%, Methodist 14%, Presbyterian 7%, Baptist 2%, Congregational 2%, others 4%. Governors: Sir Ernest Clark (Aug. 4, 1933-Aug. 4, 1945); Admiral Sir Hugh Binney, (after Aug. 4, 1945). Prime ministers: Albert G. Ogilvie (June 22, 1934-June 10, 1939); Edmund Dwyer-Gray (June 11, 1939-Dec. 18, 1939); Robert Cosgrave (after Dec. 18, 1939).

In 1937 Tasmania was beginning to recover from the world depression. Foremost among industrial undertakings was the state hydroelectric system, which showed an in-

crease of plant capacity from 81,000 h.p. (1937) to 197,900 h.p. (1946). Work in hand in 1946 was estimated to provide additional 37.500 h.p., making a total of 235,000 h.p., and more additions were contemplated. Within the ensuing two or three years £A1,000,000 was to be spent on this work. The cost of the hydroelectric scheme including transmission and distributing mains equipment was, up to 1946, approximately £A9,000,000. The undertaking showed a profit after meeting all working expenses and interest and making adequate provision for redemption of loans and depreciation of assets.

Before World War II the power committee of the standards association of Australia estimated that on a basis of a 50% load factor and 80% turbine and generator efficiency, the potential water power of the whole of Australia was about 4,750,000 h.p. Of this total 3,500,000 h.p. was available in Tasmania. At 100% load factor, therefore, Tasmania's potential hydroelectric power was about 1,750,000 h.p. To realize as much as possible of this reserve of industrial power extensive developmental works were being planned, and much had already been accomplished. After the outbreak of World War II, the hydroelectric commission had installed five more power stations, with machines producing 92,000 h.p. Orders had been placed in Britain for plants that would provide an additional 34,000 h.p. Toward the end of 1946, big water diversion works were in progress so that the new plant could be put into operation in order that Tasmania, one of the least industrialized of the Australian states, could be transformed into a centre of great industrial activity.

The successful establishment during the interwar period of works for the pulping of the wood of a Tasmanian tree (eucalyptus regnans) and the manufacture of paper from it was the triumph, after many years of experiment, of invention and technical skill over difficulties caused by the nature of this hardwood. The first mill, situated on the northwest coast, made fine printing and writing paper. Production began in 1936. In 1939, eight Australian newspaper companies formed a company for the production of newsprint. The original plant was being extended in 1946 to make it capable of producing 100,000 tons of newsprint annually. It was estimated that this industry would ultimately save Australia some £A2,750,000 yearly, the cost of imported supplies of paper pulp for newsprint.

Tassigny, Jean de Lattre de

De Lattre de Tassigny (1889—), French army officer, was born Feb. 2, 1889, at Mouilleron-en-Paretz (Vendée department). A graduate of St. Cyr, he served in World War I and was severely wounded in the Rif campaign in 1925.

In World War II, De Tassigny commanded the "Iron Division"—so-called because of its stout resistance against the Germans in the battle of Rethel in 1940. After Pétain signed the armistice in June 1940, De Tassigny was assigned to southern Tunisia but returned to France and in Jan. 1942 assumed command of the 16th division at Montpellier.

At the time of the Allied landings in North Africa in Nov. 1942, De Tassigny prepared to organize resistance against the Germans in southern France. Vichy troops promptly countermanded his orders. Arrested, De Tassigny was tried by a Vichy tribunal Jan. 9, 1943, and was

sentenced to ten years imprisonment. He escaped from prison nine months later and made his way to London, where he joined De Gaulle's movement. De Gaulle promoted him to the rank of major general and Eisenhower made him commander of French forces operating with the U.S. 7th army which took part in the Allied landings in southern France in Aug. 1944. During the final months of 1944, De Tassigny was in command of the French 1st army that was part of the Gen. Dever's 6th army group operating on the southern flank of the French-German border.

On June 5, 1945, he assumed his post as French member of the four-power Allied Control council for Germany.

Taxation

The successive impact of the great depression of the '30s and World War II left in their wake levels of taxation, debt and expenditure that dwarfed those to which the 1920s had been accustomed. The ten eventful years which ended in 1946 included what was for most countries either the closing years of an era of depression financing, or alternately a period of armaments boom. There followed in all cases the financial upheaval accompanying the outbreak of World War II. Attention will be concentrated here upon the changes which took place during these ten years in the finances of the central governments of the United States, Great Britain and Canada. Primary emphasis will be placed upon budget and tax policy, although some reference also will be made to borrowing operations.

_								

A very striking difference appears at the outset of the period between the position of the British budget and those of the other two countries. In the fiscal year 1936 the United Kingdom showed an excess of revenues over expenditures, while both Canada and the United States were experiencing substantial deficits. Canadian revenues for the fiscal year 1936 covered only 70% of total expenditures; in the United States revenues were equal to only 48% of total expenditures.

As will be pointed out in some detail below, this diflerence reflected a variation in the budgetary policies pursued. However, it was also based to some extent upon the relative speed with which the British economy rebounded from the impact of the great depression and upon the effects of an armament boom which was just getting under way in that country.

The subsequent movement of expenditures in these countries can be followed more readily by means of Table IV, which expresses the expenditures of each year as a percentage of the amounts paid out in the fiscal year 1936. If attention is directed to the first four years of the decade, it can be seen that the British pattern again differed from that of the other two countries. British expenditures rose by roughly one-fifth, while the expenditures of Canada and the United States were both only slightly higher in 1939 than they had been in 1936.

This difference in the movement of total expenditures reflected the fact that in the United Kingdom outlays for armaments were increasing far more rapidly than in either the United States or Canada. Between 1936 and 1939 British expenditures for war purposes rose 181%. In 1936 they accounted for 16.2% of total expenditures; in 1939 they made up 37.5% of the total. During those same four years the war expenditures of the United States increased by roughly one-third; those of Canada doubled. In 1939 war expenditures were 13.8% of the total in the United States; 6.1% in Canada.

In spite of the relatively rapid increase in the total expenditures of the United Kingdom between 1936 and 1939, its budget showed a net surplus for the four year period. The accounts of both Canada and the United States showed substantial deficits. In both these countries, the size of the deficit declined with reviving business to a low point in fiscal 1938, only to rise again in the following year.

Reference to Table V, which shows the percentage of total expenditures covered by revenues other than loans,

reveals the fact that the deficits in the United States were relatively much larger than those of Canada. The deficits of the dominion government ranged from 30% of total expenditures in 1936 to 3% in 1938. Those of the federal government in the United States ranged from 52% of total expenditures in 1936 to 19% in 1938. In the year prior to the outbreak of war in Europe, Great Britain financed all but 1% of its expenditures without the use of loans; Canada covered all but 9%; the United States showed a deficit equal to 41% of its total expenditures.

The outbreak of World War II in Sept. 1939 brought a sharp acceleration in the increase of public spending in both the United Kingdom and Canada. The expenditures of the United States advanced more slowly until it too entered the war in the fiscal year 1942. The so-called "defense" period which intervened was in fact a period of armaments boom similar in many respects to the British rearmament between 1935 and 1939.

The advance in public spending in these three countries during the war itself carried to levels that would have been considered stupendous a few years earlier. When British expenditures reached their peak in 1945, they were no less than 735% of the level in 1936. The expenditures of the federal government in the United States reached a peak of \$100,000,000,000 in 1945, over 11 times the amount spent 10 years earlier. The peak Canadian expenditures of 1944 were ten times as large as those of 1936.

These staggering increases were of course based upon the rapid advance in war expenditures. In the peak years noted above, the latter made up 83% of the total in Great Britain, 86% in Canada and 90% in the United States.

All three countries made a valiant effort to increase their tax revenue, to compensate at least in part for this spectacular increase in war expenditures. During the decade ending in 1945, the last year of the war, Great Britain's revenues other than those derived from loans rose by about 300%, those of Canada by 600%. The revenues of the federal government in the United States in 1945 were about 11 times as large in 1945 as they had been 10 years before.

Yet even these large increases in revenue fell far short of matching the current advance in expenditures. Table V indicates that in Canada the percentage of total expenditures covered by revenues other than loans declined from 79% in 1942 to 51% in 1945; in Great Britain this percentage dropped from 80% in 1940 to 51% in 1943, in the United States from 60% in 1941 to 28% in 1943. At the close of World War II, each country was financing in the neighbourhood of half its total expenditures by methods other than borrowing.

The full impact of these wartime deficits is revealed in the statistics of public debt which are summarized in Table VI. By the end of 1945 the Canadian debt was roughly four times as large as it had been ten years earlier. The British debt was nearly three times as large; and the debt of the United States had reached a level roughly seven and one-half times that at the beginning of the decade.

To summarize, the ten eventful years brought to Great Britain, Canada and the United States a tremendous increase in the expenditures, revenues and indebtedness of their central governments. In Great Britain, war and the preparation for war had been the dominant themes of the decade. In Canada and the United States the period began with several years in which the central problem before the economy was not war but business revival. In

Canada this era ended abruptly with the outbreak of World War II In the United States there was an interval of 'delense' financing between the depression finance of the first four years and the period of active participation in World War II

Budgetary Policies - The budget policies of the central governments in the United States and Canada during the period 1936-39 reflected the fact that the chief economic problem confronting these governments was the revival of business In both countries the first reaction to the crisis of 1931-33 had been an attempt to restore balance in the budget of the central government as quickly as possible This objective had not actually been attained Instead each country had experienced an unbroken sequence of deficits and each had evolved a policy tending to justify the temporary maintenance of an unbalanced budget in the face of the depression emergency. The policy in ques tion was the same in each case it was the so called 'double budget" Under the latter expenditures were divided into ordinary or current expenditures on the one hand, and ex traordinary or emergency outlays on the other Only the former were to be covered by current revenues The latter, being of an emergency character, should be financed by borrowing

In spite of the fact that President Roosevelt's budget message of Jan 1935 forecast an over all deficit of \$3 892 000 000 exclusive of debt retirement, this double budget philosophy made it possible for him to avoid recommending additional taxation. The president reported that anticipated revenues available for general purposes were \$3 422 000 000, which was well in excess of the regular or ordinary expenditures of \$3 302 000 000. The balance of a \$7,314 000 000 total expenditure was made up of recovery and relief items, the greater part of which was to be financed by borrowing. The program which these extraordinary expenditures financed was, of course, intended to assist in the revival of business which in turn would bring with it a budget that was balanced on an overall basis.

The Canadians had reached the same solution somewhat earlier, and in his budget speech of April 18, 1934, Finance Minister Edgar Rhodes, had explained the amount of additional taxation which was needed by comparing total revenues with ordinary expenditures. No estimate of total expenditures was mentioned in this connection. It was merely stated that the revenues would suffice to cover ordinary expenditures and "leave a surplus of \$8,800 000 to apply on capital and extraordinary expenditures." Similar tactics were used in the budget speech of March 22, 1935. As a matter of fact, the well established double budget policy of the dominion gov-

ernment provided a clear precedent for the use of this policy by President Roosevelt in his budget message of Jan 3, 1935

The budget policy used by the United Kingdom in 1935 was quite different. Here too the first reaction to the impact of the great crisis had been a determination to restore balance in the national budget. But unlike Canada and the United States, Great Britain was willing and able to put into effect the economy measures and new taxes which the restoration of a balanced budget required. These results were facilitated by a somewhat more speedy recovery from the crisis of 1931–33 than had taken place in either Canada or the United States. Nevertheless, the fact remains that in 1935 Chancellor of the Exchequer Neville Chamberlain was able to set out with a budget that was in balance and a well established policy of keeping it that way

Depression Budgets in the US and Canada, 1936–39—President Roosevelt again used the double budget de vice in his message of Jan 3 1936 Again it was possible to forecast that revenues other than loans were adequate to cover regular expenditures Again no additional taxes were recommended. The volume of expenditures for recovery and relief was estimated to be substantially lower than in previous years with a corresponding reduction in the amount of necessary borrowing. The tone of his message was optimistic and the president concluded with these words.

Our policy is succeeding The figures prove it Secure in the knowledge that steadily decreasing deficits will turn in time into steadily increasing surpluses and that it is the deficit of today which is making possible the surplus of tomorrow, let us pursue the course that we have mapped

The president's budget message of Jan 5 1937, reflected the continued revival of business in the United States For the first time since the great crisis, a budget message was presented which predicted a balance not merely on a partial but on an overall basis. As a matter of fact, a surplus of \$1,136 000 000 was forecast for the fiscal year 1938. Naturally, there were no recommendations for the levy of new taxes. The device of the double budget, which had been at the centre of the policy set out in the two previous messages, was not used in the message of Jan 5, 1937.

Unfortunately, the downturn of business during the autumn of 1937 belied the optimism of this budget mes sage By January of the following year it was obvious that, instead of a surplus, the fiscal year 1938 would produce another deficit, albeit a much smaller one than that experienced in preceding years. The president's message of Jan 3, 1938 emphasized the relationship be tween the downturn in business in 1937 and this failure to attain the predicted over all balance in the budget A somewhat smaller deficit was predicted for 1939 but no attempt was made to justify it by the double budget device It was merely pointed out that the anticipated deficit was lower than that expected in the current fiscal year, and that 1939 would be the third year in succession in which the deficit would have declined. The continued recession in business conditions also belied this prediction The actual deficit incurred in 1939 was \$3 542,000,000 as compared with \$1 384 000 000 in 1938

The president's budget message of Jan 3 1939, was the last of the predefense period In it a deficit of \$3,972,000,000 was predicted for the current fiscal year, and one of \$3 326,000 000 for fiscal 1940 In spite of his disap-

The only tax action recommended was the renewal of certain excises which were due to expire at the end of the current fiscal year

pointment over this situation, the president reaffirmed the idea that depressed business conditions were not appropriate to a formal balancing of the budget. Ordinary expenditures were again distinguished from extraordinary, and in addition it was emphasized that many of the latter were being made for projects of a self-liquidating character. The suggestion was advanced that such expenditures should not really be included among the items set out against current revenues in order to determine whether a budget was in balance, but "should occupy a separate category in budgetary reporting." This was the idea basic to the so-called "capital budget" which had been developed in Sweden. A table was presented in which the president compared the deficits of the period 1931-40 with the capital outlays of the same period. He pointed out that this table "clearly shows that the greater part of the deficits and the larger part of the increase in the public debt have gone for permanent additions to our national wealth." It was argued that "the balance has been an investment in the conservation of our human resources."

This justification of a continued deficit policy accompanied the recommendation that congress "consider moderate tax increases which would approximately meet the increased expenditures on the account of the proposed national defense program and the program for agricultural parity payments, for which no revenue provision has as yet been made."

Thus it appears that in 1939 the federal government of the United States was still operating with a substantial deficit. The president's justification for the deficit now included the idea of the capital budget as well as the distinction between ordinary and extraordinary expenditures which he had used in 1935. However, the basis for this policy was the idea that the deficits incurred would make a substantial contribution to the revival of private business.

The problem of recovery was also reflected in the Canadian budgets between 1936 and the outbreak of World War II in Sept. 1939. However, the policy of the double budget, which had been reaffirmed in Finance Minister Edgar Rhodes' message of 1935, went by the board one year later. A general election had taken place in the interval and the budget message of May 1, 1936, was presented by a new finance minister, Charles Dunning. While Dunning was not unmindful of the extent of industrial recovery achieved in Canada, he took a decidedly less optimistic position than his predecessor had done. He was not inclined to avoid unpleasant facts and disposed of the double budget with the following pithy remarks:

It is also proposed to depart from what I have sometimes called the "bridge score" method of accounting—so much above the line and so much below the line—and to present clearly the over-all deficit in the government's accounts. In the past we have too frequently misled ourselves by the form in which our government accounts were presented. We have pointed with pride to a small surplus on ordinary account and we have tended somewhat to minimize the importance of large deficits resulting from capital and special expenditures. It is time to look the facts squarely in the face. If the people of Canada are fully aware of all the facts, I am confident they will support us in taking the steps necessary to achieve that balance of government revenues and expenditures which in my opinion cannot safely be postponed much longer.

Dunning went on to emphasize the amount of the existing deficit and to announce the policy of obtaining a balance in the budget as a whole as follows:

I am not an alarmist. On the contrary, I am confident that

common sense and sound economic policies can solve our immediate problems. Moreover I am convinced that this country can bear all the burdens which the war and the depression and past mistakes have saddled upon it, great as they have been. Nevertheless I believe that no country can go on indefinitely with heavily unbalanced budgets and continue to maintain either the confidence of investors or the basis upon which her economy can function healthily and vigorously. We have now reached the stage where delay should no longer be tolerated. We must make an immediate approach to a balanced budget and we must be able to show that complete equilibrium can be reached within a reasonable time.

Dunning's policy led him to recommend an increase in the sales tax which, together with certain other tax increases, was expected to reduce the deficit in the forthcoming fiscal year from \$125,000,000 to \$100,000,000.

He was not unmindful of the need for business recovery. When he turned his back on the idea that a governmental deficit should be used as a positive instrument in a recovery program, he did so in the expectation that an approach to a balanced budget would be a more effective weapon. Moreover, he proposed to supplement his budget balancing program with an excursion into the field of incentive taxation, which will be described later in some detail.

In 1937 Dunning's objective of a balanced budget seemed well within reach. Continued recovery plus the new taxes of 1936 had reduced the current deficit to \$78,000,000, as compared with \$160,000,000 in the previous year. Further increases in revenues were forecast, and the deficit for the coming year was estimated to be only \$35,000,000. This was approximately the amount of the current deficit on the account of the Canadian National railways. Consequently, Dunning advanced no proposals for additional taxation.

"Quoth the Raven, 'Why Not Me?' "Congress continued to ignore the sales tax in 1942, as pointed out in this cartoon by Duffy of the Baltimore Sun

The actual experience of the dominion in the fiscal year 1938 exceeded expectations, the over-all deficit incurred being only \$18,000,000. However, the downturn in business in late 1937 and the failure of the Canadian wheat crop made it quite evident that the forthcoming year would not be as satisfactory.

The budget message of June 16, 1938, again specifically rejected deficit financing as an instrument of recovery policy, both in the crude form of financing by the issue of paper money and by borrowing in order to finance deliberately incurred deficits. The finance minister's attitude towards the "pump priming" argument then receiving so much attention in the United States was summarized in the following statement:

... We have had several conclusive demonstrations of the principle that government expenditure to create or stimulate employment will not have beneficial results if it is carried on in such a way or on such a scale as to create an atmosphere of fear and uncertainty. It is of little use to prime the pump of business enterprise with government expenditure if at the same time we dry up the springs of private initiative which feed the well. . . .

On the other hand, Dunning did not insist upon an absolute balance in the budget for the forthcoming year. He forecast a deficit of \$23,000,000 and stated that, "in view of the current business situation, we have not thought it wise to attempt this year to wipe out a possible deficit of the moderate proportions I have indicated by imposing further burdens upon industry and upon the people."

The actual deficit of \$51,000,000 experienced in 1939 was substantially larger than anticipated. Although the budget message of April 25, 1939, reported that the dominion had recovered substantially from the effects of the downturn of 1937, the minister's remarks indicated that he was under pressure both from the people who wanted him to "prime the pump" and those who wished the budget to be balanced immediately.

Before the end of the calendar year 1939 Canada was at war, and a new budget had taken the place of the one submitted by Dunning on April 25.

It is quite evident that although the deficits incurred in Canada between 1935 and 1939 followed the same general pattern as those in the United States, the policies behind them were radically different. In the United States, the continuance of the deficits was justified by the president in terms of an economic philosophy based upon the idea that such deficits were a useful instrument of recovery policy, to which he added the further thought that many of the expenditures which the deficits financed had been made on "self-liquidating" projects for the financing of which loans were an appropriate instrument. The Canadian policy turned its back on this philosophy, and aimed instead at a restoration of business confidence through the attainment of a balance in the government's budget; it attempted to stimulate the expenditures of private business further through a program of incentive taxation. However, at the close of the period in Canada, it was admitted that a balanced budget could not be obtained quickly, and it was pointed out that private enterprise had a definite role to play in the restoration of business

Great Britain, 1935-39.—Great Britain had a balanced budget in 1935 and attempted to maintain that balance during the period of rearmament which preceded the outbreak of World War II. As Table I indicates, revenue other than loans exceeded total expenditures for the period 1936-39 taken as a whole. This was the result of a policy of levying additional taxes each year to match in full the anticipated increase in armament expenditures.

The budget message of April 1936 estimated that such expenditures would produce a deficit of £21,000,000. The entire amount was to be financed by additional taxation. The message of April 1937 reported a further increase in armaments spending, anticipated a deficit of £15,000,000, and provided for additional taxes of a like amount. Again in the budget message of April 1938 a deficit of about £30,000,000 was anticipated on the basis of the increase in armaments expenditures. This deficit also was to be covered by additional taxation.

The break with this policy came in Sir John Simon's budget message of April 1939. This time the anticipated increase in armament expenditures was of far greater size, and it no longer seemed expedient to provide all of the additional revenue by taxation. On the contrary, only £24,500,000 was to come from new taxes, and £280,000,000 was to be raised by borrowing. With this budget Great Britain really entered the realm of war finance.

U.S. "Defense Period."—As has already been pointed out, there were no transitional or rearmament budgets in Canada, but there was a clearly marked transition or "defense" period in the United States which covered the interval between 1939 and the entrance of the United States into World War II. The first budget message of the so-called "defense" period was presented on Jan. 3, 1940. It was prefaced by a review of the budgetary policies of the '30s. The speed of the revival from the business recession of 1937–38 was compared with the much slower recovery from the depression following 1929, and much of the credit for this difference was assigned to the deficit policy of 1937 and 1938.

As for the immediate future, the president pointed out that although there had been substantial business recovery, there were still large numbers of unemployed. He believed that it would be dangerous to curtail too suddenly or too drastically the support which the federal deficit was giving to business activity and enunciated the following policy:

We should count upon a natural increase in receipts from current taxes and a decrease in emergency expenditures, and we should try to offset the unavoidable increase in expenditures for national defense by special tax receipts, and thus hope to secure for the over-all picture, a gradual tapering off, rather than an abrupt cessation of the deficit.

In the proposed budget I have tried to interpret the wishes of our people. They want to strengthen our national defenses and are prepared to pay additional taxes for this purpose. They wish to attain, if possible, an over-all decrease in expenditures. They would like to see a reduction in the deficit but not of a magnitude that would imperil the progress of recovery.

The deficit forecast for fiscal 1941 was \$2,176,000,000. It was indicated that a tax program would be introduced providing \$450,000,000 in additional revenue and reducing the anticipated deficit to \$1,716,000,000.

These estimates were revised upwards very drastically later in the year as the German army began to overrun country after country in Western Europe. The defense expenditures as estimated in the budget message of Jan. 3 were about \$1,940,000,000. In June this total was raised to \$3,250,000,000, in August to \$5,000,000,000. These figures did not include appropriations which could not be expended in the current fiscal year. If the latter were also taken into account, it appeared that by Aug. 5, 1940, congress had appropriated more than \$14,000,000,000 for defense purposes exclusive of the cost of enforcing the acts for compulsory military training and putting the National Guard into active military service.

In spite of the enactment of two revenue bills by con-

gress during 1940, one of which was calculated to produce about \$1,000,000,000 additional revenue in a full year's operation while the other set up an excess profits tax that was estimated to produce a similar amount when in full operation, the federal deficit for fiscal 1941 was \$5,104,000,000. This was far in excess of the \$1,716,000,000 estimated in January on the basis of additional taxes of \$450,000,000.

The budget message of Jan. 3, 1941, differed markedly from its predecessors. Defense had now taken the centre of the stage. Expenditures for this purpose were reported to constitute 62% of the total. The total defense program had risen to \$28,480,000,000. A deficit was forecast for 1942 of \$9,200,000,000 in spite of the fact that revenues were estimated to be 50% higher than in fiscal 1940, the last year prior to the defense period. This deficit was due entirely to the defense spending; anticipated revenues for 1942 exceeded the total of nondefense expenditures in that year.

In April 1941 Secretary Henry Morgenthau, Jr. appeared before the committee on ways and means to request an increase in taxes of \$3,500,000,000 which would bring total revenues up to about two-thirds of anticipated total expenditures in the fiscal year 1942.

The continued acceleration of the defense program produced a drastic revision of the budget estimates in Aug. 1941. Total expenditures were estimated between \$22,000,000,000 and \$25,000,000,000 instead of \$19,000,000,000 and the deficit was estimated between \$13,000,000,000 and \$16,000,000,000. In October new budget estimates were issued setting the deficit for 1942 at \$12,500,000,000. Actually the deficit incurred in that fiscal year was \$19,598,000,000, but before the year was out the country had moved from the defense period into a state of war.

Great Britain and Canada, 1939-45.-Reference to Tables I, II and III reveals that during the period of active participation in World War II the United Kingdom financed 50% of its total expenditures with revenues other than loans; Canada covered 57% without borrowing, the United States 41%. However, in appraising the relative vigour of the budgetary policies pursued by these countries, it must be borne in mind that the period of active participation was smaller for the United States, and that both Canada and Great Britain were covering substantially larger percentages of their total expenditures with revenues other than loans immediately prior to their entrance into the war.2 Moreover, it must not be overlooked that although revenues equalled only 28% of total expenditures in 1943, they had risen to 46% of a much larger total in 1945.

There was a sharp contrast between the British and Canadian budget policies as expressed in the war budget messages which followed immediately upon the outbreak of World War II in Sept. 1939. In presenting his budget of Sept. 27, 1939, Sir John A. Simon estimated that in the year total outlays would be about £2,000,000,000 instead of £1,300,000,000 as he had estimated in April, and that the deficit would run to £1,110,000,000 instead of £380,000,000.

Simon stressed the inflationary impact of a spending program of this size and recommended a policy of financing the additional expenditures out of the proceeds of new taxation and loans purchased out of "genuine savings."

The Canadian budget of Sept. 12, 1939, presented by J. L. Ilsley, also disclosed a substartial increase in the deficit. Ilsley emphasized the idea that the real cost of the war could not be postponed and could be avoided only by an increase in national productivity. However, the policy used in the British budget speech, that the current deficit should be financed without credit expansion, was rejected. Instead it was pointed out that the Canadian economic system had a good many idle resources which could be put to work through credit expansion. So long as this was true, a policy involving a certain amount of credit expansion was appropriate. When full employment was reached, deficits would become highly inflationary, and the objective of policy should be the one set out by Sir John Simon, namely, the financing of total expenditures out of taxes and loans purchased with current savings. Because Canada had not yet reached full employment, Ilsley was content with a tax program which would raise \$21,000,000 during the current fiscal year, \$62,000,000 when in full operation. These taxes would reduce the anticipated deficit for 1940 from \$156,000,000 to \$135,-

In the budget speech of July 23, 1940, Sir Kingsley Wood reaffirmed the objective laid down by Sir John Simon in the preceding September. Inflation control continued to be the objective of British budget policy throughout the remainder of the war period. However, the inflationary pressure was of such magnitude that taxes and savings were only a part of a much broader program including import licensing, the allocation of raw materials and foodstuffs, price control, subsidies, rationing, full control of a segment of British industry and a limitation of the dividends which could be distributed by public companies during World War II.

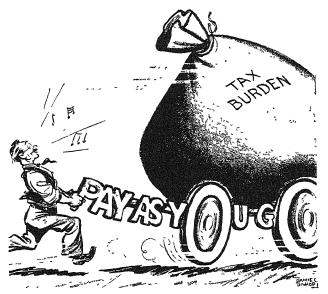

The Canadian budget of June 24, 1940, repeated the general logic set out in the message of the previous September and reported that while the country had not yet reached full employment, it was approaching that level. It was reported further that although the first borrowing of the war had been from the chartered banks and hence was of an inflationary character, borrowing from the public had begun in Jan. 1940 and a war savings campaign had been inaugurated in May. A much larger deficit was in the offing, \$700,000,000 as compared with \$118,000,000 actually incurred in the preceding year. While new taxes were imposed, they were expected to leave a deficit of between \$550,000,000,000 and \$600,000,000.

The same general policies were reflected in the budget message of April 29, 1941. The dominion was still borrowing substantial amounts from the banks and the additional taxes proposed were calculated to yield only \$250,000,000 in the current year as compared with a budgetary deficit of \$618,000,000. The latter did not include the borrowing which the dominion undertook in order to finance Great Britain's exchange deficit in Canada. If this was also taken into account, the total amount of borrowing in 1942 was expected to be \$1,250,000,000 in spite of the increase in taxes. There was a heavy emphasis on the need for additional savings.

By the time the next budget was reported in June 1942, it was apparent that Canada had reached the second of the two stages which Ilsley had described in 1939. Direct controls had been installed over wages, salaries and prices and existing controls over production had been extended. The deficit of the forthcoming year was estimated to be \$2,228,000,000, and a tax program was recommended which would produce \$378,000,000 in the current year.

The logic used in the budget of 1943 was quite similar.

 $^{^2}$ In 1939 Canada covered 91 % of its total expenditures with revenues other than loans; Great Britain 99 % In 1941 the United States covered only 60 % of its total expenditures with current revenues.

"Whistling as He Works," was Bishop's idea of the average taxpayer's attitude concerning the pay-as-you-go tax bill passed by the U.S. congress in June 1943. The cartoon appeared in the St. Louis Star-Times

It was acknowledged that the Canadian economy had reached full employment; it was admitted that some of the current borrowing had been inflationary, and heavy emphasis was placed upon the need for stimulating voluntary savings in order to prevent inflation. This same emphasis on voluntary savings was the dominant theme of the budget message of June 26, 1944, which was really the last of the wartime series in Canada.

United States, 1941-45.—The policy of using a deficit as a device to facilitate the transition to full employment, which was the most notable feature of budgetary policy in Canada, was identical with that which President Roosevelt had enunciated in his "defense" financing budget message of Jan. 1941.

His budget message of Jan. 5, 1942, had a different emphasis. The president said:

I stated last year in the Budget Message that extraordinary tax measures may be needed to "aid in avoiding inflationary price rises which may occur when full capacity is approached." The time for such measures has come. A well-balanced tax program must include measures which combat inflation. Such measures should absorb some of the additional purchasing power of consumers and some of the additional funds which accrue to business from increased consumer spending.

A number of tax measures have been suggested for that purpose, such as income taxes collected at the source, pay-roll taxes, and excise taxes. I urge the Congress to give all these proposals careful consideration. Any tax is better than an uncontrolled price rise.

Congress was requested to impose a program of taxes which would yield \$7,000,000,000 in new revenue. While this was a very large tax program, it left a deficit which was estimated at \$35,400,000,000. Thus there was the same emphasis in the United States on the curtailment of private expenditures by rationing, price and credit controls as in Canada and the United Kingdom. There was also the same emphasis on the need for voluntary savings and the importance of the sale of savings bonds.

In the budget message of Jan. 6, 1943, these ideas found an even clearer expression. The president was now offering a \$100,000,000,000 budget presenting "the maximum program for waging war." His message contained a full flowering of the anti-inflation philosophy which had been put forward by Sir John Simon in Great Britain in 1939 and which was to receive a strong statement in Ilsley's Canadian budget of March 1943. The president said:

We must assure each citizen the necessities of life at prices which he can pay. . . . By a concerted effort to stabilize prices, ients, and wages we have succeeded in keeping the rise in the cost of living within narrow bounds. We shall continue those efforts, and we shall succeed.

The stabilization of incomes and the absorption of excess purchasing power by fiscal measures are essential to the success of the stabilization program. I am confident that the Congress will implement that program by adequate legislation increasing taxation, savings, or both. Thus we help to "pay as we go" and make the coming peace easier for ourselves and our children....

We cannot hope to increase tax collections as fast as we step up war expenditures or to absorb by fiscal measures alone all excess purchasing power created by these expenditures. Nevertheless the more nearly increases in tax receipts follow increases in expenditures, the better we sateguard our financial integrity and the easier the administration of price control and rationing.

I believe that we should strive to collect not less than 16 billion dollars of additional funds by taxation, savings, or both,

during the fiscal year 1944.

On the basis of present legislation, we expect to meet 35 percent of total estimated Federal expenditures by current receipts during the fiscal year 1944. If the objective proposed in this message is adopted we shall meet approximately 50 percent of expenditures during the fiscal year 1944.

This objective of current revenues equal to 50% of total expenditures was a downward revision of a goal of two-thirds laid down by Secretary Morgenthau in April of the preceding year, when the emphasis on the inflation problem had been not nearly so great. Meanwhile, however, the level of expenditures had risen from \$12,700,-000,000 to an estimated \$100,000,000,000, and a broad program of price and credit controls had been installed to assist in checking the rise in prices. The revenue which Morgenthau's two-thirds goal required was estimated at \$9,200,000,000; that which Roosevelt's 50% objective necessitated was in the neighbourhood of \$50,000,000.

There was a substantial difference of opinion between congress and the treasury with reference to the amount of additional tax revenue which should be raised in 1943. Congress was mindful of the extent of the tax burden which had already been imposed, and believed that so far as individual income taxation was concerned the country had reached the point of diminishing returns. Congress was aware that revenues had risen from \$7,600,000,000 in the year prior to the outbreak of World War II to \$22,000,-000,000 in 1943, and Table II shows that the actual yield in the fiscal year 1944 would be no less than \$44,000,000,ooo. Congress had good reason to be fearful of the repressive effect of additional taxation.

Congress was also left in considerable doubt as to the precise amount of money which would have to be raised if taxation was to be the primary bulwark against inflation. When Secretary Morgenthau appeared before the committee on ways and means in Oct. 1943, he did not ask for \$16,000,000,000 in added taxes as the president had done in January, but for \$10,500,000,000. Moreover, there were some among the president's advisers who felt that not even the \$16,000,000,000 program originally proposed by the president would have served as the primary bulwark of an anti-inflation program. Hence it appeared likely that even if the treasury's program of \$10,500,000,000 were adopted, primary emphasis would still have to be placed upon rationing and the control of individual prices. Consequently, the committee on ways and means stated its conviction that "the proper psychology (and freedom from fear of inflation) can be maintained only by strict economy

in government expenditures through effective price control, rationing and wage control." This committee reported out a tax bill providing \$2,300,000,000 in additional revenue. The bill agreed to in the conference committee was of similar size.

Before congress actually passed the Revenue act of 1943, the president had presented his budget message of Jan. 13, 1944, repeating the secretary of the treasury's request for \$10,500,000,000 of additional taxation made in the preceding October. The president indicated that another \$100,000,000,000 budget was in the offing and forecast a deficit of \$59,000,000,000 in fiscal 1945. He stated that the \$10,500,000,000 tax program was a necessary minimum.

When the much smaller tax bill passed by congress reached the president, it was vetoed, only to be passed over his veto in Feb. 1944.

The president's budget message of Jan. 3, 1945, did not repeat this request for additional tax revenue. Instead, it reported that the period of construction for war purposes had been completed and the supply lines filled. The forecast was made that war expenditures could be expected to taper off. Instead of a request for additional taxes there was a caution against premature tax reduction. The president stated:

Wartime taxes must be maintained as long as large scale war expenditures are necessary. There is no justification for tax reductions as long as we are engaged in a major war.

In the last analysis, tax and budget policies were only a part of the anti-inflationary program in each of the three

countries. Like the United States, Canada and Great Britain placed heavy reliance on controls of production, wages, prices and credit and upon rationing. Each of these countries found it inexpedient to finance the war by taxation alone. Each found it necessary to borrow on a large scale. Each tried to curb the inflationary effects of the borrowing by stimulating the purchase of government securities out of the current savings of their citizens. The net result of their anti-inflationary policies is shown in the cost of living statistics which are contained in Table VII.

The relatively small changes in the cost of living which took place during these years testified to the efficacy of the measures taken for the control of inflation. The extent of the achievement can be appreciated if it is borne in mind that during the relatively short period of 19 months during which the United States was an active participant in World War I, the cost of living in that country had risen about 38%. Between July 1914 and Nov. 1918 the cost of living in the United Kingdom had risen 120%; in Canada, 57%.

Tax Policy

The tax revenues of the central governments of Great Britain, Canada and the United States during the decade ending in 1935 are shown in Tables VIII, IX and X. Certain major differences in these three tax systems should be pointed out before attention is directed to the tax policies which these countries pursued during the succeeding decade.

In the fiscal year 1936 the federal government of the United States obtained roughly 36% of its tax revenues from levies on income. Something less than half of this amount came from the individual income tax, something more than half from that on corporate net income. An additional 10% was produced by the estate and gift taxes, and 10% more came from the customs duties. The bulk of the remaining 44% came from various types of excises, chiefly those on tobacco and liquor, and a system of excises on manufacturers' sales which had been imposed earlier in the depression period.

In the national tax system of Great Britain the income

tax was somewhat more important than in the United States. It should also be borne in mind that in Great Britain the income tax continued to be essentially a levy on individuals, not broken down into a levy on individuals and one on corporations as in the United States. In 1936 the British death duties produced 12% of total tax revenues as compared with 10% in the United States. British customs duties were substantially more important than those of the United States; excises were somewhat less important. The former accounted for approximately 27% of total tax revenues in 1936, the latter for 22%. The relatively large yield of the British customs was ex-

plained in part by the in-

stallation of new and higher duties early in the depression, largely for protection-

ist purposes.

The dominion tax system in 1936 was quite different from those of the United States and Great Britain. Here income taxes were much less important. In 1936 they produced only 26% of total tax revenues. There were no dominion death duties, and the yield of the customs duties made up 23% of the total tax revenue. On the other hand, Canada had a general sales tax which produced 24% of its total tax revenues in Table X.—Revenues of the Federal Government in the United States

Source: Annual report of the secretary of the treasury, 1945.

1936. In that year this sales tax plus the excises accounted for roughly one-half the dominion's total tax revenue. The importance of the sales tax in the Canadian system had follow

been accentuated by its central position in the tax programs of the early years of the depression, and by the decline in the productivity of the customs duties. The latter had accounted for 44% of total tax revenue in 1931.

The United States, 1935–39.—As pointed out above, the first tendency to produce a fully balanced budget in the face of an acute depression situation had given way in both Canada and the United States to the "double budget" policy. This policy emphasized a balance between current revenues and ordinary expenditures. Since a balance of this limited sort was forecast in the budget presented in the United States on Jan. 3, 1935, it was not surprising that the accompanying message did not contain a request for additional taxation. The president merely suggested the extension of certain excises which were due to expire and the continuance of the three cent postage rate.

When, therefore, the president submitted a special message to congress in June 1935 requesting immediate tax revision, his action came as something of a surprise. However, it was evident from the content of this message that the primary objective was the revision of methods of taxation rather than the provision of additional revenue.

Specifically the president recommended that:

... In addition to the present estate taxes, there should be levied an inheritance, succession, and legacy tax in respect to all very large amounts received by any one legatee or beneficiary; and to prevent, so far as possible, evasions of this tax, I recommend further the imposition of gift taxes suited to this end.

Because of the basis on which this proposed tax is to be levied and also because of the very sound public policy of encouraging a wider distribution of wealth, I strongly urge that the proceeds of this tax should be specifically segregated and applied, as they accrue, to the reduction of the national debt. By so doing we shall progressively lighten the tax burden of the average taxpayer, and, incidentally, assist in our approach to a balanced budget.

To further reduce the "disturbing effects upon our national life that came from great inheritances of wealth and power" the president recommended "a definite increase in the taxes now levied upon very great individual net incomes." Specifically, Roosevelt took exception to the fact that progression under the existing surtax schedule stopped at incomes of \$1,000,000.

The committee on ways and means began deliberations on this message on July 8, 1935. A bill was prepared by the committee on ways and means and with certain

changes by the finance committee, became law on Aug. 30, 1935. As passed by the congress the bill included the following:

- (1) The surtax rates on individual incomes were increased starting at \$50,000, with a top rate of 75% on net incomes of more than \$5,000,000. Under the act of 1934 the top rate was 59% on an income of \$1,000,000.
- (2) A slightly graduated tax on corporations was imposed. The rates were 12½% on corporation incomes not in excess of \$2,000, 13% on incomes between \$2,000 and \$15,000, 14% between \$15,000 and \$40,000 and 15% above \$40,000. Under the act of 1934 corporations had been subject to a flat rate of 13¾%. This new rate schedule did not really become effective since it was superseded by the rates set up under the revenue act of 1936.
- (3) The capital stock tax was increased from \$1 per 1,000 to \$1.40 per 1,000, and the rates used under its companion, the declared value excess profits tax, were also increased.
- (4) An intercorporate dividend tax of 1½% was in effect, imposed by allowing corporations to deduct from gross income only 90% of the dividends received from other corporations.
- (5) In lieu of the inheritance tax and the gift tax on donees suggested by the president, the estate tax was increased in two respects. First, by lowering the exemption from \$50,000 to \$40,000 and second, by increasing the rates. The latter now began with a 2% rate on the first \$10,000 of taxable estate and graduated up to 70% on taxable estates over \$50,000,000.
- (6) Similarly, the gift tax on donors was increased, so that the rates would be approximately three-fourths of those then used under the estate tax.

This bill was estimated to yield approximately \$250,000,000, which was a small amount when compared with the deficit of \$4,500,000,000 incurred in fiscal 1936.

In 1935 congress had also taken an important step in the development of social welfare legislation when it adopted the Social Security act. Systems of old age annuities and unemployment insurance were established to be financed with the proceeds of a set of new taxes on payrolls. In addition a program was set up under which the federal government and the states joined in the provision of relief for certain categories of needy persons.

While the president's budget message of Jan. 3, 1936, also stressed the balance between current revenues and ordinary expenditures and included no request for ad-

ditional taxation, another special tax message asking for immediate tax legislation was sent to congress on March 3. This message was based upon the invalidation of the processing taxes used to finance the agricultural adjustment program and upon the enactment of the soldiers' bonus. The president called for a permanent additional taxation amounting to \$620,000,000 annually.

To raise this amount the president suggested (1) the imposition of an undistributed profits tax on corporations, (2) a windfall tax on taxpayers who had already shifted to others the burden of the processing taxes which were to be returned to them under the supreme court decision and (3) a temporary tax on the processing of certain agricultural products. The committee on ways and means passed a bill carrying out the first two suggestions of the president but did not follow his suggestion for the imposition of a temporary processing tax on agricultural commodities.

The main controversy over this bill in congress centred around the imposition of an undistributed profits tax in lieu of the existing taxes on corporate income, capital stock and declared value excess profits. The house bill provided for a single graduated tax on corporation incomes, the graduation being based first on the size of the corporation, and second, upon the proportion of a corporation's net earnings retained in the business. The purpose of this method was (1) to prevent avoidance of surtax by individuals through the accumulation of income by corporations, (2) to remove serious inequities and inequalities between corporation, partnership and individual forms of business organizations and (3) to remove the inequity as between large and small shareholders resulting from the existing rates on corporations. There was considerable opposition to this tax, particularly on the part of business groups, who feared that the tax might force an unwise distribution of earnings needed for business expansion or as reserves to meet future contingencies.

The senate finance committee did not agree with the house bill, particularly as to repealing the existing corporate income, capital stock and declared value excess profits taxes, and offered the following as a substitute:

(1) a corporate normal tax with rates from 15½% on the first \$2,000 of income to 18% on incomes in excess of \$40,000, (2) an undistributed profits tax of 7%, (3) retention of the capital stock tax and declared value excess profits tax at existing rates and (4) an increase in surtax on net incomes of individuals between \$6,000 and \$50,000.

As finally agreed to by the two houses, the bill contained the following: (1) a normal tax on corporate income with rates ranging from 8% on the first \$2,000 of income to 15% on incomes of more than \$40,000, (2) a tax on the undistributed portion of corporate net income ranging from 7% to 27% and (3) a capital stock tax of \$1 per 1,000, and a declared value excess profits tax with the rates used under existing law.

The increase in surtax rates on individual incomes between \$6,000 and \$50,000 was eliminated, and dividends were made subject to the normal tax on individuals.

Instead of supplanting the existing array of corporation taxes with a single levy on undistributed profits, a new tax using the latter as a base had been added to the system. In view of the subsequent withdrawal of this modified version of the president's reform proposal, probably the most important action taken in 1936, from the long run point of view, was the subjection of divi-

dends received to the normal tax on individuals.³ This action was basic to much of the later controversy over the "double taxation" of income.

The pattern of the two preceding years was reproduced in 1937. The budget message of the president anticipated an over-all balance in the federal budget. Naturally under these conditions there was no need to request the enactment of additional tax legislation. Congress was merely asked to renew the excises which were due to expire and to continue the three cent postal rate. While a supplementary budget message of April 21 painted a more pessimistic picture, there was still no mention of the need for immediate tax revision. Then on June 1 the president submitted another special message urging immediate legislation to prevent evasion of the income tax law.

Technically, the basis for the revenue act of 1937 was the report of a joint committee on tax evasion and avoidance, set up as the result of a senate resolution. The thesis of the measure was loophole plugging. Like the act of 1936, this legislation was basically designed to make the rates used under the tax on personal incomes effective.

The legislation of 1937 included: (1) a redefinition of the personal holding company and its income, together with an increase in the rates applied thereon, (2) a new method of taxing foreign personal holding companies, (3) action disallowing losses on sales or exchanges between members of the same family, etc., (4) a new tax on income received by nonresident aliens and (5) a restriction of the exemption allowed to trusts. The anticipated yield from the measure was small.

The three tax bills enacted in 1935, 1936 and 1937 had much in common. In all of them, additional revenue was a secondary consideration. The legislation of 1935 was preceded by a tax message stressing the need for the redistribution of wealth and income; the undistributed profits tax of 1936 and the loophole plugging measure of the following year were designed to make the now highly progressive surtax rates more effective. The legislation of 1938 and 1939 reflected a different motive. There was now a strong tendency to amend the tax structure in such a way as to promote business confidence and hence facilitate business recovery.

The crux of the legislation of those two years was the revision of the undistributed profits tax. Representatives of business who had opposed the enactment of that legislation in 1936 were now loud in their complaints concerning the effects of the measure. It was argued that the surtax on undistributed profits (1) discouraged in many cases legitimate business expansion, and, therefore, had an adverse effect on employment, (2) put a penalty on corporations which found it necessary to use current earnings in payment of debt, (3) burdened the small and weak corporations more than the large and financially strong corporations and (4) was unfair to corporations with impaired capital which under state law could not legally declare dividends. It was pointed out that the relief provisions applying to corporations having contracts not to pay dividends or requiring use of current earnings for the payment of debts were so restrictive as to afford no relief in meritorious cases.

To meet these complaints the committee on ways and means completely revised the income tax on corporations. The new system contained in the committee's bill included the following provisions:

(1) Corporations with net incomes of \$25,000 or less were subject to graduated rates from 12½% to 16%,

³A precedent for this action could be found in the excise on dividends enacted under the NRA legislation of 1933.

with no undistributed profits tax added. This relieved 88% of the corporations from the undistributed profits tax.

- (2) Corporations with net incomes in excess of \$25,000 were taxed at a flat rate of 20% with a credit against the tax of 4%, or 4 cents of each dollar of dividends paid out.
- (3) A special undistributed profits tax was levied on corporations whose stock was held by 10 or fewer individuals, and which had a net income of \$40,000 or more. This was the famous "third basket" tax eliminated on the floor of the house.

The committee on ways and means also revised the system of taxing capital gains and losses, and rewrote the estate tax, so as to produce a single rate schedule with a credit of 161/2% for state taxes paid. Under the committee bill, only one exemption of \$40,000 was allowed for both estate and gift taxes.

The bill, as finally enacted after agreement with the senate conferees, retained the undistributed profits principle with respect to corporations having net incomes of \$25,000 or more. The maximum rate applied to the income of such corporations which distributed no earnings was 19%. For corporations making full distribution of earnings the rate was $16\frac{1}{2}\%$. The spread between no distribution and a full distribution was $2\frac{1}{2}\%$ and took the form of a dividend paid credit. This system was to be temporary and was to expire in 1939. Corporations with incomes of \$25,000 or less were to be exempt from the undistributed profits tax.

In the final bill the capital gain and loss provisions were completely rewritten. Gains held for 18 months or less were taxable as ordinary income at the regular normal and surtax rates; gains realized on assets held more than 18 months but less than 2 years were taxable at a maximum rate of 20%, and gains on assets held for over 2 years were taxable at a maximum rate of 15%. This supplanted a system set up in 1934 under which the percentage of gains and losses taxed as ordinary income ranged through 5 classes, from 100% on assets held 1 year or less, to 30% on assets held 10 years or more.

No changes were made in the estate tax exemption, but the annual gift tax exemption was reduced from \$5,000 to \$4,000.

This bill became law without the signature of the president, who expressed disapproval of the provisions relating to capital gains and the undistributed profits tax. Senator Byron Patton Harrison, in a speech in the senate on May 28, 1938, defending the tax bill stated: "I have heard no voice lifted in Congress or elsewhere to defend the undistributed profits tax as it was in the law until yesterday. Thank God, it is not in the law today." And in defending the capital gain provision, Senator Harrison stated that "the new law will release much of the frozen credit of this country and ought to be most helpful in getting some industries started and in relieving the distress caused by the unemployment situation in this country."

The policy of continuing to aid business recovery by removing deterrents from the tax laws was continued in the revenue act of 1939. Here again much controversy centred around the undistributed profits tax. As finally enacted, the revenue act of 1939 contained the following provisions:

(1) The undistributed profits tax, which was applicable to corporations with incomes of \$25,000 or more, was allowed to expire with respect to taxable years be-

- ginning after Dec. 31, 1939. In lieu of this tax, corporations with incomes above \$25,000 were subject to a flat rate of 18% on net income.
- (2) The lower rates imposed by the 1938 act with respect to corporations with incomes of less than \$25,000, were continued. These rates were 12½% upon the first \$5,000 of income, 14% on the next \$15,000 of income and on the next \$5,000, 16%.
- (3) Corporations, partnerships and individuals were permitted to carry over their net operating business losses for a period of two years.
- (4) The \$2,000 limitation on capital losses was repealed. If the capital asset which was sold had been held less than 18 months, the loss might only be applied against a gain from the sale of an asset held for less than 18 months. If there was not sufficient short term gain (on assets held less than 18 months) to absorb such loss, the loss might be carried over into the next year, and applied against a short term gain in that year. If the capital asset had been held over 18 months, the loss resulting therefrom was treated as a long term loss and might be applied against ordinary income.
- (5) Corporations were permitted to increase their valuations for the purpose of the capital stock tax for the fiscal years ended June 30, 1939, and June 30, 1940. Under the revenue act of 1938, corporations were entitled to a new declaration (either lowering or raising their capital stock value) for capital stock tax purposes for the fiscal year ending June 30, 1941.

Another important change in the federal system of taxation adopted in 1939 was the Public Salary Tax act of 1939, which subjected to taxation for taxable years beginning after Dec. 31, 1938, the compensation of all state and local officers and employees. The states were also given the power to tax the salaries of federal officers and employees. In this same year congress also enacted into law an Internal Revenue code, which was the first statutory codification of the internal revenue laws into absolute law since 1873.

This act brought to a close the period of depression financing in the United States. By the following year the defense problem had taken the centre of the stage.

Canada, 1935–39.—In its first reaction to the impact of the great depression, the dominion government had made a vigorous attempt to raise substantial amounts of new revenue in order to bring its budget back into balance. The basis for that program had been a drastic increase in the general sales tax. By 1935, however, Canada had a well entrenched double budget policy, and hence the pressure for additional taxation was much less insistent than it had been at the beginning of the depression period. The tax program set out in the budget speech of March 22, 1935, was intended to produce additional revenues of \$12,000,000. It was not intended to produce a fully balanced budget, but merely to offset certain anticipated increases in expenditures. This program included the following changes in the dominion's income tax:

- (1) The installation of a surtax in investment income. This surtax applied a progressive rate schedule ranging from 2% to 10% on "investment income" in excess of \$5,000. It is important to note that all income in excess of \$14,000 was defined as "investment income." This measure was based upon the same philosophy as the earned income credit then used in both the United States and Great Britain.
 - (2) The reduction in the allowable rate of depletion

⁴A special relief provision was inserted in order to cover the small taxpayer whose income tax rate was less than these maximum rates.

for precious metal mines from 50% to 331/3%.

(3) An increase in the rate applied on corporate net income from $12\frac{1}{2}\%$ to $13\frac{1}{2}\%$. For those corporations using consolidated returns, the rate was raised from $13\frac{1}{2}\%$ to 15%.

(4) The installation of a levy on gifts in excess of \$1,000 per annum with rates ranging from 2% to 10%. The most important change in the dominion's excise system was a reduction in the levy on distilled spirits

from \$7.00 to \$4.00 per gal.

As already pointed out, a general election brought a change of administration, and in 1936 a much more vigorous budget policy was enunciated. The double budget idea was dropped and as a first step toward a truly balanced budget a tax program was submitted intended to produce between \$28,000,000 and \$30,000,000 of additional revenue. The bulk of this revenue (\$23,000,000) was to be raised by increasing the rates under the dominion sales tax from 6% to 8%. Most of the remainder was to come from an increase in the rate applied to corporate net income from 13½% to 15%. The rate on corporations using consolidated returns was raised from 15% to 17%.

This portion of the tax program of 1936 was in fact a reversion to the policy which Canada had used at the outset of the depression. Now, however, something new was being added. In addition to raising more revenue, Dunning proposed to enter the field of incentive taxation. His plan for the stimulation of investment in metal mining was

offered in the following terms:

The government . . . proposes to grant exemption from corporate income tax to any metalliferous mine coming into production between May 1, 1936, and January 1, 1940, such exemption to apply to its income for the first three years following the commencement of production. This definite step to encourage the development of the mining industry . . . should do much to accelerate new exploration and development work during the present year and the following two or three years.

The budget message of Feb. 25, 1937, contained no major proposals for adding to the total tax revenues, and with one exception the tax proposal of the following year were also of minor importance.⁵ The exception was another experiment in incentive taxation, this time in the form of sales tax exemption to building materials, in order to stimulate the housing program.

This idea of incentive taxation was developed further in the concluding budget message of the prewar period, that of April 25, 1939. There it was proposed not only to extend the exemption to new metalliferous mines for three additional years, but also to introduce a tax credit

for new investment generally.

This attempt to use tax concessions as a means of stimulating business activity was far and away the most interesting feature of the Canadian tax policy during the years immediately preceding the outbreak of World War II. In a sense, it was the counterpart of the policy of removing irritants to business which characterized the legislation of 1938 and 1939 in the United States.

Great Britain, 1935–39.—The tax measures enacted in Great Britain during these years were methods of financing an armaments boom. Hence they did not emphasize social reform as the legislation of 1935 and 1936 in the United States had done, nor did they represent an attempt to promote business revival.

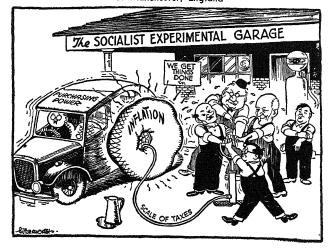

In 1936 Neville Chamberlain faced a deficit of £21,000,

ooo. He proposed to raise £12,000,000 by increasing the standard rate under the income tax (comparable to the normal tax in the United States), and the remainder by increasing the duty on tea, by instituting a series of measures intended to reduce avoidance under the income and estate taxes, and by certain transfers from the so-called Road fund. The severity of the increase in the standard rate was tempered somewhat by raising the allowances under the income tax to the levels which had prevailed before 1931.

Almost all of a deficit of £13,000,000 anticipated in the following year was to be financed with an increase in the standard rate. There was also enacted at this time a new tax called the National Defense contribution, which was an attempt to recoup trading profits arising out of the defense effort. This tax was applied to the growth of profits received by all persons engaged in industry or trade of any kind whose profits in any accounting year ended after April 5, 1937, exceeded \$2,000. The base period against which the growth of profits was measured was 1933-35, but it should be borne in mind that this tax also contained an optional invested capital base. Taxable profits could also be defined as the excess of 60' over invested capital in the case of a corporation and the excess over 8% for other forms of business enterprise. In all cases, the rates applied depended upon the rate of return on invested capital. In the case of a corporation, they were 2000 on a return between 6% and 10%; 25% when the return was between 10% and 15%, and 331/3% when the return was in excess of 15%. While the National Defense contribution would not reduce the current deficit, it was calculated to yield between £20,000,000 and £25,000,000 in a year of full operation.

Again in 1938 the entire amount of the anticipated deficit was to be financed by additional taxation, and again the bulk of the money was to come from an increase in the standard rate. The balance was to be provided by increases in the excises on gasoline and tea and by the imposition of a new tax on power alcohol. By now the standard rate had reached the level where some relief for small incomes was necessary, and an adjustment was made in the rates applied in the lowest brackets. The depreciation allowance used in calculating business incomes was also increased. Like the two preceding budget messages, that of April 1938 contained a considerable discussion of the problem of tax avoidance.

"Going Up," a critical version of tax policies under the Attlee administration, as presented by Butterworth in the Daily Dispatch of Manchester, England

 $^{^6}Most$ important of these was an increase in the gift tax rates. The new rate schedule was graduated from 5% to 15%.

The final budget of the prewar period, that of April 1939, contained a much larger anticipated deficit (£400,000,000) and only a small part of it (£24,000,000) was to be financed by added taxation. For the first time in this series of rearmament budgets, there was to be no increase in the standard rate. Most of the new money was to come from additional excises on tobacco and sugar, and from additional motor vehicle duties. A special set of surcharges was to be added to the levy on estates.

The Three Tax Systems in 1939.—Between 1936 and 1939 the combination of the tax measures just summarized and a rise in business activity brought substantial increases in the tax revenues of Great Britain, the United States and Canada. The increase in the total was 38% in Canada, 28% in the United States, and 21% in Great Britain.

There was also a tendency for the revenues produced by the income tax to make up a larger percentage of the total. While corporate and personal income taxes produced 36% of the total in the United States in 1936, their yield was 44% of the total in 1939. The yield of the British income tax rose from 39% of total tax revenue to 44%; that of the Canadian income tax from 26% to 33% over this same interval.

In the United States, revenue from excises, which had made up 39% of the total in 1936, dropped to 34% in 1939. Similarly, the British excises dropped from 22% of the total in 1936 to 19% in 1939. In Canada, on the other hand, excises (including the general sales tax) provided roughly half of the total revenue in each of these years. Customs duties declined in importance in all three countries.

Defense Taxation in the United States, 1940–41.—The first revenue act of 1940 was based upon a presidential message dated May 16, 1940. That message requested \$3,250,000,000 additional income for the fiscal year 1941 to finance certain defense expenditures, among them the procurement of new and additional equipment for the army and navy, an increase of production facilities and the stock pile of materials for use in the defense program, plus the cost of putting armaments production on a 24 hour basis.

The financial plan used at that time called for the issuance of \$4,000,000,000 in defense obligations to be outstanding not more than five years. These obligations were in turn to be retired from the proceeds of increased taxation. The individual income, estate and gift taxes, payable under existing law were increased by 10% of the tax payable. The personal exemption for single persons was reduced from \$1,000 to \$800 and for married persons from \$2,500 to \$2,000. This added 2,290,000 new taxpayers to the tax rolls. The corporation income tax rate was increased by 1%. The tax on cigarettes was increased from \$3 per 1,000 to \$3.25 per 1,000. The tax on liquor was increased from \$2.25 per gal. to \$3.00 per gal., an increase of 331/3%; the tax on beer from \$5 per bbl. to \$6 per bbl., an increase of 20%, and the tax on gasoline from 1 to 11/2 cents, an increase of 50%.

This program was expected to produce about \$1,000,000,000 in additional revenue. Of this amount, over half was to be placed in a special fund for the retirement of defense obligations. The remaining half was the part obtained by broadening the income tax base through lowering the exemptions, by increasing the surtax in the middle brackets, and by raising the rate on corporate income. In these cases it was difficult to segregate the increased revenue from the ordinary revenue, and it was deemed advisable to allow the former to remain in the general fund.

Another message from the president dated July 1, 1940,

recommended the enactment of a steeply graduated excess profits tax to be applied to all individuals and all corporate organizations without discrimination. There had been a demand for this form of taxation when the first revenue act of 1940 was being discussed, and in its report on that measure the committee on ways and means had expressed the desire that the rearmament program should furnish no opportunity for the creation of new war millionaires or for the further enrichment of already wealthy persons.

While the committee was convinced of the need for an excess profits tax, it found it impracticable to apply such a tax to individuals and partnerships, particularly since individuals and partnerships were subject to heavy surtaxes on their income, whether or not it was left in the business, while corporate stockholders were not taxed on their undistributed earnings. Furthermore, since all of the assets of an individual, whether he was a sole proprietor or a member of a partnership, were at the risk of the business, it was extremely difficult, if not impossible, to determine the amount of capital actually invested.

In drafting the excess profits tax, the committee on ways and means also refused to follow the treasury recommendation as to the base to be used in measuring excess profits. The treasury proposal was that the tax should apply to profits in excess of a certain return on invested capital. The committee on ways and means, the finance committee and the congress believed that the invested capital base was an inadequate standard for measuring excess profits in many cases. Such a method would have favoured the corporation which had retained its earnings over a long period of time, as against the corporation which distributed its earnings and thereby permitted the government to secure the individual normal and surtax on such earnings. It would have favoured the company which by chance was incorporated in a year of high values, as compared with a company organized in a year of low values, or would have deemed the present shareholders to have realized excess profits on what the original shareholders paid for their stock.

Accordingly, in lieu of the treasury proposal, the congress adopted an alternate plan, which defined excess profits as the excess of the profits for the year over either (1) a stated return on their invested capital or (2) more than 95% of the average profits earned in the 1936-39 period. The excess profits tax rates were progressive, ranging from 25% on the first \$2,000 of excess profits to 50% on excess profits above \$500,000. A specific exemption of \$5,000 was adopted which had the effect of limiting the excess profits tax to 70,000 to the 500,000 active corporations in the United States. In order to stimulate the corporations and private enterprises which were participating in the defense program, a special amortization deduction was allowed with respect to facilities necessary to the national defense, and profits limitations applicable to the construction of naval vessels and army and navy aircraft were suspended. This bill was enacted on Oct. 8, 1940.

In April 1941 Secretary of the Treasury Morgenthau appeared before the committee on ways and means to request the enactment of legislation designed to provide \$3,500,000,000 in additional revenue. This was intended to bring revenues other than loans up to two-thirds of total expenditures. The tax bill, which was enacted by congress on Sept. 20, was expected to produce an additional \$3,553,400,000 in a full year of operation.

The tax bill of 1941 lowered the single persons' exemp-

tion for income tax purposes from \$800 to \$750, that of married persons from \$2,000 to \$1,500. This action brought the total number of persons liable to the income tax to 13,181,000, and the total number of income tax returns to 22,108,000. It resulted in 2,275,000 new taxpayers.

The house committee on ways and means had inserted in the revenue act of 1941 a requirement for a mandatory joint return of husband and wife, but this was defeated by the house. In this bill, taxpayers with incomes under \$3,000 were given an optional method of computing their tax, if their entire income was derived from salary, wages, compensation for personal services, dividends, rents, annuities, or royalties. The taxpayer electing this optional method had his tax already computed on a table set out in the law and on his return. The rates of the excess profits tax were increased by 10 percentage points, so that they ranged from 35% on excess profits incomes not more than \$20,000 to 60% on excess profit incomes in excess of \$50,000. Another very important change was made in the excess profits tax. Under the revenue act of 1940 the corporate income tax had been allowed as a deduction in arriving at excess profits net income. Under the revenue act of 1941, this deduction was not allowed, but, in order to avoid double taxation, the excess profits tax was allowed as a deduction in computing the corporation income tax.

The corporation normal tax was not changed in the revenue act of 1941, except that the 10% defense tax, which had been imposed for a period of 5 years under the revenue act of 1940, was integrated with the regular income tax. The total normal corporate rate remained at 24%. However, a special surtax on corporations was imposed at the rate of 6% on corporate surtax net income not in excess of \$25,000, and 7% on corporate surtax net income in excess of \$25,000. This special surtax was designed to reach partially tax exempt federal securities, which were exempt from the corporation normal tax. In 1941 the congress passed a law making the income from all federal obligations issued on or after March 1, 1941, subject to both the normal tax and the surtax.

The tax bill of 1941 also included substantial changes in the excise system. A number of new taxes were levied, and the rates used under certain existing excises were increased in order to discourage the production or use of articles needed for the defense effort.

In a letter dated July 31, 1941, to the chairman of the committee on ways and means the president took exception to certain features of the revenue act of 1941, particularly the mandatory joint return provision of the house bill, the method of permitting corporations to compute excess profits on an average earnings base, and the provisions relating to excises. However, the committee refused to modify its position, and the chairman advised the president to that effect in a letter dated Aug. 2, 1941.

Another piece of tax legislation enacted in 1941 is worth mention here. This was the set of relief amendments added to the excess profits tax enacted on March 7, 1941, which applied retroactively to Jan. 1, 1940. It had been evident at the time of enactment of the second revenue act of 1940 that the excess profits tax did not make sufficient provision for hardship cases. Hence a general relief clause had been inserted into the law giving the commissioner of internal revenue authority to make adjustments where abnormalities existed in income and capital, and giving the board of tax appeals the right to review the decision of the commissioner. The staff of the

joint committee on internal revenue taxation and the treasury was instructed by the house and senate conferces under the 1940 bill to study the problem of relief and report to the appropriate committees as soon as possible. The act of March 7 was based on this report. It set up a series of specific relief provisions to take the place of the general relief clause enacted in the previous year.

U.S. War Taxation.—In 1942 the United States became an active participant in World War II. Projected expenditures rose to extremely high levels. Those for the fiscal year 1943 were estimated to exceed \$73,000,000 000. Since the existing federal tax structure was expected to yield only \$17,000,000,000,000, a deficit of \$56,000,000 000 was in the offing. The gross public debt was expected to reach

\$133,000,000,000 by June 30, 1943.

In recognition of this situation, the congress enacted the revenue act of 1942, which was expected to provide an additional revenue of approximately \$7,000,000,000. Of this total, no less than \$4,966,000,000 was to come from the tax on individual incomes. The personal exemptions under the regular income tax were cut from \$1,500 to \$1,200 for a married person, from \$750 to \$500 for a single person. The credit for dependents was reduced from \$400 to \$350. The normal rate was raised from \$6. Surtax rates were increased drastically, the rate on the lowest bracket being increased from 66. to 136. thus raising the basic rate applied to personal incomes from 10% to 19%.

In addition there was enacted the so-called Victory tax, which imposed a flat 5% on that part of the taxpaver's net annual income (except capital gains and interest on federal obligations) which was in excess of 5624. Net income for the purpose of this tax was computed without deductions for expenses or allowances not connected with a trade or business or incurred in the production of income. Thus, charitable contributions, taxes on a residence and losses from fire or other casualty were not deductable. On the other hand, credits were allowed currently for debt reduction, insurance premium payments and bond purchases, but such credits were not to exceed the limits set for the "postwar credits" allowed under this tax. The latter were 25% of the Victory tax, or 5500, whichever was less, for a single person; and 40% of the tax, or \$1,000 for a married person or the head of a family, plus 20%, or \$100 for each dependent. These postwar credits were allowable only to the extent that they had not been exhausted by the current credits listed above. Also it was stipulated that the Victory tax and the ordinary taxes on individual income combined were not to exceed 90% of net income. The Victory tax was imposed for the war period only and had the effect of putting nearly 50,000,000 taxpayers on the rolls.

One of the most important features of the Victory tax was the fact that it instituted a system of collection at the source which was the forerunner of the more extensive system set up under later legislation.

The act of 1942 also altered the treatment of capital gains and losses. The number of categories was reduced to two. Profits on capital assets held less than six months were now treated as taxable income. Those on assets held longer than six months were included in taxable income to the extent of 50%. The amount of deductible capital loss was limited to the extent of the capital gains plus net income, or \$1,000, whichever was less; but taxpayers could carry over for five succeeding years any excess of losses over gains.

The severity of these measures necessitated certain relief provisions. Service personnel on active duty were

given preferential treatment in the form of an exclusion from gross income of \$250 for a single person, and \$300 in the case of a married person. Pensions received for personal injuries or sickness resulting from active service in the armed forces of the Allied nations were exempt from the income tax. For taxpayers generally there was introduced a new deduction for extraordinary medical expenses, and relief was instituted for Americans who had incurred war losses abroad. In addition, taxpayers with incomes less than \$3,000 from wages, salaries, dividends, interest, rent, etc., had their returns simplified, and income tax returns in general were no longer required to be made under oath.

The act of 1942 also called for \$1,300,000,000 from additional taxes on corporations. The rate in corporate net income was raised from 31% to 40%, the increase coming in the surtax rather than the normal tax.- The excess profits rate was raised to 90% with a postwar credit equal to 10% of the excess profits tax. This credit could be used currently up to 40% of the amount paid for retirement of debt within the year. Otherwise, it could not be used until after World War II.

As a relief for new and expanding corporations, the act limited the effective rate to be applied to normal, surtax and excess profits taxes to 80% of the corporation's net income. The general relief provisions under the excess profits tax were greatly expanded. Mutual insurance companies other than life or marine were taxed either at the regular corporate rates on their net income, or at a rate of 1% on the gross amount of their income from interest, dividends, rents and net premiums, less dividends paid to policy holders. An exemption was installed for the corporate surtax of western hemisphere corporations in cases where 80% of the income was derived from business activities in the western hemisphere.

While the act of 1942 did not alter the rates under the estate tax, the \$40,000 exemption plus the \$40,000 life insurance credit used under the previous law was supplanted by a single exemption of \$60,000 for either or both combined.

The act of 1942 also included changes in the excise system calculated to yield about \$650,000,000 of additional revenue.

While this legislation was before the finance committee, the treasury had appeared before that committee to advocate a so-called spendings tax which was to be added to the tax on incomes. This proposal was not agreed to by the committee. Proposals to adopt a federal sales tax were also rejected by congress. As a matter of fact, the Victory tax was adopted in preference to a sales tax.

In presenting his \$100,000,000,000 budget in Jan. 1943, President Roosevelt made three tax recommendations: (1) that \$16,000,000,000 be raised in new tax revenue, or savings, or both, (2) that the income tax be simplified and (3) that collections under the income tax be put on a pay-as-you-go basis.

The first action taken by congress in 1943, the Current Tax Payment act, was aimed at the last of these objectives. This legislation extended the withholding system which had been applied under the Victory tax of 1942, to the regular tax on individual incomes. Provision was made for withholding at the source 20% of income after allowing exemptions of \$1,248 for a family and \$624 for a single person. This system became effective Jan. 1, 1943, and applied to all income except that paid to members of the armed forces, that received for agricultural, casual or domestic service, for services performed by a minister of the gospel, by a non-resident alien, or by United States

citizens outside the United States.

The proposal to go over to a "pay-as-you-go" system generated a considerable controversy in congress, and turther difficulties were raised by the problem of the treatment of the 1942 tax which also came due in 1943. Some advocated complete forgiveness, others partial forgiveness, still others wanted full payment of the 1942 tax with actual collection spread over a period of years. Out of this controversy came the following compromise:

- (1) If the tax for the lower of the two years, 1942 and 1943, was \$50 or less, the tax for the lower year was cancelled.
- (2) If the tax for the lower year was between \$50 and \$66.67, a flat \$50 of the tax for the lower year was cancelled.
- (3) If the tax for the lower year was more than 66.67, 75% of the tax was cancelled.

This act also provided additional relief for servicemen. It excluded from income tax \$1,500 of servicemens' pay, and provided special relief from the 1942 tax after the serviceman had entered the service.

The Current Tax Payment act was signed June 9, 1943. In October of the same year congress took up the problem of raising more revenue. By this time the treasury had reduced the goal of the proposed legislation from the \$16,000,000,000 requested in January to \$10,500,000,000. Congress did not choose to follow the treasury program, believing that individual income taxes were nearing the point of diminishing returns. As a result, it enacted a tax bill which was estimated to yield only slightly more than \$2,300,000,000 in a full year's operation.

No changes were made in the normal or surtax rates, but the Victory tax was reduced from 5% to 3% and the refund or credit provisions of the previous laws were eliminated. The earned income credit was removed. On the other hand, a new exemption was introduced for blind persons, and the mustering out pay of service personnel was exempt from the individual income tax.

While there were no changes in the rates applied to corporate net income, the rate on excess profits was raised from 90% to 95%. The specific exemption under the excess profits tax was increased from \$5,000 to \$10,000, and certain important changes were made in the invested capital credit. Tax exempt organizations were required for the first time to file informational returns showing their receipts and disbursements.

Payroll tax rates were frozen at 1%, a considerable number of excises were increased, and postal rates were advanced.

This bill was unacceptable to the president, who vetoed it, but the congress passed it over his veto and it became law in Feb. 1944.

By its action with reference to the tax bill of 1943, the congress evidenced its belief that the taxes which had already been imposed were reaching the limit of the nation's taxable capacity. It was not surprising therefore that the legislation of 1944 was concerned with the simplification of the existing law rather than the production of additional revenue.

In enacting this legislation, congress had before it the following objectives: (1) to relieve the great majority of taxpayers from the necessity of computing their income tax, (2) to reduce the number of tax computations, (3) to simplify the return form, (4) to decrease the number of persons required to file declarations of estimated tax and (5) to eliminate some of the difficulties inherent in the

filing of declarations of estimated tax used in the pay-as-you-go system.

The act of 1944 relieved 30,000,000 taxpayers of the necessity of computing their income taxes, permitting them to use a simple income statement in place of a detailed income tax return. Of the remaining 20,000,000 who filed such returns, 10,000,000 could use a simple tax table which showed their entire tax. The other 10,000,000 filled out returns which were more detailed but which were still much simpler than those previously required.

To achieve this simplification, certain important changes were made in the basic provisions of the individual income tax. The personal exemption for surtax purposes was changed to a uniform \$500 each for the taxpayer, for his spouse and for each of his dependents. An optional \$500 standard allowance for deductions was set up for persons whose gross incomes were \$5,000 or more. The Victory tax was repealed and there was set up in its place a new 3% normal tax on the net income of each person in excess of a flat exemption of \$500. Finally, the levies previously known as the normal tax and the surtax were combined into a new surtax with rates ranging from 20% on the first \$2,000 of surtax net income to 91% on the portion of surtax net income in excess of \$200,000.

The legislation of 1944 was really the last of the series of war measures in the United States, the legislation of the following year being directed at the problems of the postwar transition. Realizing the importance of taxation in the postwar economy, the joint committee on internal revenue taxation planned and conducted a study of postwar taxation early in 1945. For this purpose, the membership of the committee was increased by one minority member from the senate finance committee and one minority member from the committee on ways and means. The staff of the joint committee on internal revenue taxation, the staffs of the treasury and the bureau of internal revenue were instructed to collect and analyze data, information, and plans with regard to the problems in the transition and postwar periods. The material contained in these studies for the joint committee were used in formulating the Tax Adjustment act of 1945.

The main purpose of this act was to make available more promptly benefits already granted under existing law. The only provision which was designed to reduce tax liabilities was that which increased the specific exemption for excess profits tax purposes from \$10,000 to \$25,000. This provision never became effective because of the repeal of this tax as of Dec. 31, 1945. The benefits which the taxpayer actually received under the Tax Adjustment act were (1) the advance in the maturity date of the 10% postwar credit funds to Jan. 1, 1946, (2) the provision of the quick refunds of overpayments of taxes resulting from carrybacks of unused excess profits credits or net losses and (3) the recomputation of amortization deductions for emergency facilities.

On Nov. 8, 1945, congress enacted the revenue act of 1945. This was the first general reduction act since 1929. The excess profits tax was repealed as of Dec. 31, 1945; individual income taxes were reduced, corporation surtaxes were reduced by 4 percentage points for taxpayers with net incomes of less than \$25,000 and by 2 percentage points in the case of taxpayers with net incomes in excess of \$50,000. The capital stock tax was repealed, as was also its companion measure, the declared value excess profits tax, and about 12,000,000 individuals who had been liable for the normal income tax but not the surtax were

removed from the tax rolls. Special benefits were granted to members of the armed forces and to veterans. All service pay of servicemen below the rank of commissioned officers was excluded from income if received after Dec. 31, 1940, and before the termination of World War II. The tax attributable to service pay of commissioned officers was deferred through an extension of time without interest. The wartime tax on the use of automobiles was repealed as of July 1, 1946.

War Taxation in Canada, 1939-45.-Ilsley's emergency budget of Sept. 2, 1939, called for a tax program which was expected to produce \$21,000,000 in the current year, reducing the anticipated deficit from \$156,000,000 to \$135,-000,000. The expected yield in a full year's operation was estimated to be \$62,000,000. The core of this program was an excess profits tax. As in the subsequent legislation of the United States, the taxpayer was given the option of computing excess profits with reference to base period income or as a percentage return on invested capital. When the base period income was used, the rate applied was 50%. When the invested capital base was used, the rates progressed by brackets from 10% on profits between 5% and 10% of invested capital to 60% on profits in excess of 25% of invested capital. However, this system was never put into effect. It was superseded in 1940 by a tax which was applied to the increase over base period net income, and in which the invested capital base was used only for relief purposes. Like the excess profits tax used in the United States, the Canadian tax was levied in addition to the tax on corporate net income. Unlike the United States, Canada extended the tax to all forms of business organizations.

In addition to the excess profits tax, Ilsley proposed to increase the rate on corporate net income from 15% to 18% (for consolidated returns from 17% to 20%), to install a war surtax of 20% of the amount of the ordinary individual income tax and to increase the excises, particularly those on liquor, beer, wines and tobacco. The rates on tea and coffee were increased as a substitute for the reduction of the exemptions used under the individual income tax.

The deficit anticipated in the budget message of June 24, 1940, was substantially larger, and the tax-program offered at that time was calculated to yield \$110,500,000 in the current year—\$280,000,000 when in full operation.

From the point of view of immediate productivity, the most important items in this program were those designed to protect the international position of the Canadian dollar. A tax of 10% was levied on the value of all imports from outside the British empire. This was expected to produce \$50,000,000 in the current fiscal year. A steeply graded excise on the sale of automobiles, which rose to 80% on amounts in excess of \$1,200, was intended to prohibit the purchase of the better grade vehicles, which were of course primarily imported from the United States.

More significant from a longer run point of view was the aforementioned revision of the excess profits tax which turned the latter into purely and simply a levy on the wartime increase in profits. The rate was raised from 50% to 75%, and in addition it was stipulated that in no case was a corporation to pay a total income and excess profits tax which was less than 30% of its total net profit. The corresponding minimum for individuals and partnerships was 12% (30% minus the 18% rate on corporate net income). Under these arrangements, corporations which paid the 75% rate under the excess profits tax also paid a tax of 18% on corporate net income. Those which did not pay the 75% rate were in effect taxed at a flat 30%

of corporate net income. A general relief clause was inserted in the excess profits tax, and a board of referees was set up to administer it. Special relief was granted to the gold mining and oil producing industries.

The individual income tax was also revised. The existing surtaxes on the amount of the tax due were removed and the regular rate schedule was revised upward. Exemptions were cut from \$1,000 to \$750 for a single person and from \$2,000 to \$1,500 for married persons. There was no change in the dependency exemption. Failure to use the individual income tax more aggressively in 1939 was attributed to the problem of adjustment with the existing provincial taxes, some of which applied high rates in the upper brackets.

There was also enacted in 1940 a new levy on individuals called the National Defense tax. This applied a flat rate to all incomes above \$600 in the case of a single person, and \$1,200 in the case of a married person. The rates used were 2% for married persons and single persons whose incomes were not more than \$1,200, 3% for single persons with incomes above \$1,200.6 This tax was to be collected at the source. It bore considerable resemblance to the Victory tax subsequently enacted in the United States.

Ilsley's message of April 29, 1941, forecast an even larger deficit and contained a tax program intended to produce an additional \$250,000,000 in the current year, \$300,000,000 when in full operation.

The basis for the tax legislation of 1941 was an agreement with the provinces which would overcome the obstacles to the development of the dominion tax system pointed out in the budget speech of the previous year. Under the terms of this agreement, the dominion undertook to make certain payments to the provinces and their municipalities compensating them for a temporary withdrawal of their taxes on personal and corporate income. In addition, in order to reconcile the provinces to the installation of a dominion tax of three cents a gallon on gasoline, the dominion agreed to guarantee to the provinces the equivalent of the current yield of their taxes on gasoline. Ilsley emphasized that these arrangements were temporary, pointed out that the provinces were not required to accept the plan, and if they did, that they could withdraw from it at the end of any fiscal year. The budget speech of 1942 indicated that all of the provinces had accepted this agreement.

Having made these arrangements with the provinces, it was possible to move more aggressively in the development of the individual income tax. The rates used under the National Defense tax were increased from 2% to 5% in the case of married persons, and from 3% to 7% in the case of individuals. However, the exemption for single persons under this tax was raised from \$600 to \$660, and the credit for dependents was increased from \$8 to \$20. The latter was the equivalent of a 5% rate on \$400. The rates used under the individual income tax were also increased. They now began at 15% instead of 6%, and reached a top rate of \$5% at an income of \$500,000. If these rates were added to those used under the National Defense tax, the effective rate on individual income ranged from 20% at the bottom to between 90% and 92% at the top.

The tax on investment income was also revised. It now became a flat 4% on all such incomes over \$1,500. The provision which had interpreted all income over \$14,000 as investment income was dropped.

The charitable deduction under the income tax was sharply curtailed; the maximum deduction was cut from 50% of net income to 10%.

Finally, a plan was introduced for the payment of the individual income tax in 12 monthly installments. While the amount of the tax due was based on the previous year's income, this was a definite step in the direction of the pay-as-you-go principle.

In addition to the foregoing action relating to the income tax, the minimum rate used under the excess profits tax was increased from 12% to 22% of corporate net income. As a result, corporations not paying the 75% rate on excess profits were in effect subject to a flat rate of 40% on corporate net income. Those paying the 75% rate on excess profits were still subject to an 18% rate in corporate net income.

The arrangement with the provinces also facilitated the adoption of the first dominion death duty. This was a tax on successions. The budget message introducing it emphasized that this tax was to be temporary, and pointed out that it, in combination with the existing provincial death duties, was intended to impose a total burden "of about the same general magnitude as the British death duties."

The legislation of 1941 also included increases in the existing excise rates, particularly those on sugar, beer and automobiles. Some additional excises were introduced, including the aforementioned tax of three cents a gallon on gasoline, and the exemption of building materials under the sales tax was deleted.

This was a major tax program. In his budget speech, Ilsley concluded, "I think it will be agreed that the Dominion is attempting to carry the pay-as-you-go policy as far as is reasonably practical."

Another large deficit predicted in the budget message of June 23, 1942, was accompanied by recommendations for taxation intended to yield \$378,000,000 of additional revenue in the current year.

As in the previous year, the focal point of this program was the tax on individual incomes. In 1942 the so-called National Defense tax was consolidated with the graduated tax on personal incomes, and provision was made to collect both at the source in-so-far as this was possible. However, this change was made in such fashion as to perpetuate what were really two separate taxes.

One of these imposed a flat rate of 7% on married persons and on single persons with incomes of less than \$1,800. Single persons with incomes between \$1,800 and \$3,000 were to pay 8%, those whose incomes exceeded \$3,000 were to pay 9%. As in the National Defense tax the exemptions allowed under this new levy were \$660 for a single individual; \$1,200 for a married person. The dependency adjustment was a tax credit of \$28. This compared with \$20 allowed under the National Defense contribution.

The second tax imposed in 1942 was a graduated levy on personal net income. The minimum rate was 30% as compared with the 15% rate previously in use. The new rate schedule rose to a maximum of 85% at an income of \$100,000, whereas under previous law the maximum rate of 85% had been reached at an income of \$500,000. Under the new levy, each taxpayer was allowed a flat exemption of \$660, instead of \$750 for a single person and \$1,500 for a married person, plus a set of tax credits. The latter were \$150 for a married person plus \$80 for each child. These credits were intended to be the equivalent of the

 $^{^6\}mathrm{It}$ was stipulated that in no case was the tax to reduce the income below \$600 or \$1,200, as the case might be.

value of the exemptions previously in use under a 20% tax

When these two new taxes were considered together, it appeared that the maximum levy ranged from 96% to 98% of net income. To reduce the severity of these rates, a new medical deduction was allowed, and it was stipulated that a substantial portion of the new tax was to represent forced saving. Against the latter portion, a credit was allowed for certain forms of voluntary savings such as the payment of premiums on life insurance, the repayment of mortgages on a home and contributions to pension funds.

These changes in the levy on individual incomes were accompanied by an increase from 75% to 100% in the rate applied to excess profits. In addition, the rate on corporate net income was raised from 18% to 30%, and a minimum excess profits tax of 10% on corporate net income was imposed. The net effect was to levy a flat rate of 40% on the net income of corporations not subject to the 100% rate on excess profits. Corporations subject to the latter also paid a rate of 30% on corporate net income.

When the latter combination was used, it was stipulated that a portion of the payment was to be offset by a postwar refund. The new rates on corporations were expected to limit profits to 70% of the prewar standard. A one year carry forward of losses was also introduced.

The legislation of 1942 also included substantial increases in selected excises, particularly those on alcoholic beverages, soft drinks, cigarettes and passenger transportation. Substantial new excises were imposed on candy, chewing gum, cabarets, jewellery, luggage and other luxury items.

The tax program advanced in the budget speech of March 2, 1943, was of smaller size. Out of a total of \$152,-000,000 in additional revenue, \$115,000,000 was accounted for by the installation of a pay-as-you-go system under the individual income tax. This action paralleled that taken in the Current Tax Payment act in the United States in the same year. In addition to installing pay-as-you-go, certain excises were increased, particularly those on tobacco, liquor and cabarets, and the Canadian postal rates were advanced for the first time during World War II. A purchase tax of the type adopted by Great Britain was considered at length, but was rejected on the ground that if nonessential items were excluded, the productivity of such a tax would be too small to make its enactment worth while.

The program adopted in 1944 was of even smaller importance from the point of view of the expected increases in yield. The most important action taken in that year was probably the abandonment of the system of forced saving which was a part of the individual income tax. Collections on this account were to terminate at the end of June 1944 with a resulting revenue loss of \$110,000,000 in a full year's operation.

There were a good many minor changes in the income taxes. A \$480 deduction for the blind was installed, special relief was set up applying to the earnings of married women and the alimony deduction was revised.

The changes in the tax on corporations included the installation of a one-year carry back and a three-year carry forward. Additional relief was provided by a special postwar deduction for deferred maintenance and repairs. One-half the expenditure for such purposes "incurred in a period to be fixed by the governor in council, may be charged against the income of a previous fiscal period but not farther back than the fiscal periods ending in 1943."

To facilitate the postwar transition, the treatment of expenditures for research and technical development were amended. All such expenditures as were of a current nature were to be allowed in the year of expenditure. Those of a capital nature were to be written off over a three-year period.

It was also provided that "in respect of bona fide new investment in depreciable assets carried out after a date to be designated by the governor in council, the taxpayer should be allowed rates of depreciation which may vary at the option of the taxpayer between maximum rates and minimum rates which will be one-half the ordinary rates."

To make available more quickly the postwar refunds under the excess profits tax, the taxpayers were allowed to assign the refundable portion of tax as security "in cases in which the governor in council is satisfied that the funds so obtained will be used in capital expenditures in preparation for postwar business giving desired employment."

Like the legislation in the United States of 1945, the Canadian program of 1944 seemed to be aimed primarily at the problem of postwar adjustment.

War Taxation in Great Britain.—The budget message which Sir John Simon presented immediately following the outbreak of World War II in Europe included tax proposals intended to produce $f_{107,000,000}$ of additional revenue in the current fiscal year, and £226,000,000 in a year of full operation. As in most of the tax programs of the rearmament period, an increase in the standard rate under the income tax was the heart of the first wartime program. The increase in the standard rate, together with the accompanying reduction in the amounts of the socalled allowances, accounted for £70,000,000 of the £107, 000,000 immediate increase in total tax revenues. The balance was to be made up by increasing the rates under the estate tax by 10%, by advances in the surtax schedule and by additions to the excises on alcoholic beverages, tobacco and sugar. The substantial difference between the immediate and ultimate productivity of the program was accounted for by the inclusion of an excess profits tax which would not, of course, produce immediate revenues. An armaments duty had already been enacted in 1939 in connection with the compulsory military training program. Sir John Simon now proposed to generalize this tax. The rate applied was to be 60%. Unlike the excess profits tax used in the United States, no regular invested capital option was provided under the British legislation of 1939.7 The National Defense contribution was continued, and it was stipulated that the new excess profits tax was to be due only when it exceeded in amount this earlier profits

Another tax program of somewhat smaller size was presented in April 1940. An increase in the standard rate was to produce £62,700,000 out of a total of £128,000,000 in a full year of operation. The balance was to come from the excises on beer, spirits, tobacco and matches, and from increases in the rates used by the post-office, and the telephone and telegraph systems.

At this time a general relief clause was inserted into the new excess profits tax, to be administered by a board of referees.

More significant than the measures actually put forward in the budget of April 1940, was the announcement of the government's intention to install a purchase tax on

The invested capital option was allowed to new companies; i.e., those commencing business after July 1, 1936. In the budget message of April 1940 it was pointed out that the invested capital alternate could only be used as a relief measure.

wholesale sales. No revenue estimates were made, and no rates were announced. It was merely indicated that the tax was to be levied at the wholesale level and was to exclude exports, food, tobacco, gasoline and services.

Sir John Simon reported the government's rejection of a proposal to levy a tax on increases on personal wealth attributable to the war, as well as his doubts concerning the feasibility of the forced saving proposal advocated by Sir John M. Keynes. On the other hand, it was proposed to place a limit on the amount of dividends which could be paid out during World War II.

By July 1940 it had become clear that the deficit would be much larger than originally anticipated. Sir Kingsley Wood reported a tax program intended to produce £239.000,000 additional revenue when in full operation. As in earlier programs, the major role was to be played by the standard rate. An increase in the latter was expected to produce £84,000,000. The balance was to come from increases in the surtaxes, from the duties on beer, tobacco, wines and entertainments, from the installation of differential rates under the new purchase tax and from another increase of 10% in the rates applied to estates.

Between the budget messages of April and July 1940 the rates used under the excess profits tax had been advanced from 60% to 100%. This action alone was expected to produce £40,000,000 of additional revenue yearly.

The tax legislation introduced by Sir Kingsley Wood in 1941 was intended to obtain another £250,000,000 a year from the income tax. This was to be done by reducing the allowances and the earned income credit. The result of this action was to extend the tax to approximately 2,000,000 persons not previously taxable.

The budget message of April 1941 was notable primarily for the relief measures which it contained. This message introduced the 20% postwar credit under the excess profits tax and led to the installation of a similar credit under the tax on personal incomes. The latter was intended to be the equivalent of the taxes collected by reason of the reduction in the allowances and the earned income credit. In a sense this credit was a concession to Sir John Keynes' forced saving proposal, which had been rejected in the budget message of April 1940.

Unlike its predecessors, the program introduced in April 1942 was concerned exclusively with commodity taxation. Increases were made in the duties on alcoholic beverages, tobacco and entertainment. The luxury rates used under the purchase tax were raised from 33½% to 66½%. This action was intended to produce £186,000,000 in additional revenue in a full year's operation, and was based on the idea that by this time the bulk of the untaxed purchasing power was to be found in the lower income brackets.8

Under the legislation of 1942 the National Defense contribution was extended for a period of five additional years.

The philosophy basic to the budget message of April 1943 was similar. Here again a statement appeared that the bulk of the remaining purchasing power lay in the lower brackets, and a tax program was set out to produce £110,000,000 additional revenue by increasing excises.

Before the budget message of April 1944 was presented, Great Britain, like Canada and the United States, had found it necessary to bring collections under its income tax to a current basis.

While Sir John Anderson forecast a large deficit in his

budget message of April 1944, he made no proposals for increasing taxes. Much of his message was devoted to a defense of the 100% rate on excess profits, and to certain proposals intended to facilitate the postwar adjustment. Chief among these was a special initial allowance of 20% on the cost of new plant and machinery, which was to be in addition to the regular depreciation allowance. To go into effect after the war, this measure was designed to assist in the re-equipment of industry. A similar allowance of 10% was to be made on new buildings, and depreciation allowances were introduced for the extractive industries. More generous treatment was also to be accorded research expenditures in the postwar period. If such expenditures were of a capital nature they were to be written off in five years, or over the life of the asset if this was shorter. If they were not capital outlays, they were to be treated as a business expense.

It is evident that by 1944 Great Britain, like the United States and Canada, had passed the peak of its wartime tax program, and was looking toward the postwar period. This statement applies equally to the budget of April 1945, in which the bulk of the discussion concerned the success of the pay-as-you-go plan during its first year of operation, the extension of relief to small business under the excess profits tax and the double taxation treaty with the United States.

Summary of Wartime Tax Experience.—The tax revenues of the federal government of the United States reached a total of \$43,000,000,000 in 1945. This represented a net increase of 245% over the level of 1942, and 750% over 1939, when the defense period was just beginning. Great Britain's tax revenues reached a level in 1945 which was 250% higher than in 1939. In that country the defense period began in 1935. The net increase in tax revenues during the subsequent decade was 333%. In Canada, which had no clearly defined "defense" period, tax revenues increased 385% between 1939 and 1945.

In all these countries the tax programs of World War II, and the rise in business activity which accompanied the war, produced substantial increases in the relative share of the tax burden borne by income taxes. This tendency was most marked in the United States. In 1945 the individual income tax alone produced approximately 45% of total tax revenue. When the corporate income tax was added, the percentage rose to 56. When the excess profits tax was included as well, no less than 81% of the total tax revenues of the federal government were accounted for. In 1939 the corporate and individual income taxes had accounted for 44% of total tax revenue.

The increase in the importance of the income taxes was also very marked in Canada. In 1945 the yield of taxes on corporate and individual incomes equalled 45% of the total. If the excess profits tax was included as well, 65% of total tax revenues were accounted for. In 1939 personal and corporate income taxes made up 33% of total tax revenue.

In 1945 the British levies on income, including the excess profits tax, made up 60% of total tax revenue. In 1939 the corresponding taxes accounted for 44% of the total. However, if the excess profits tax was left out of account, the percentage of the total obtained from income taxes was no higher in 1945 than it was in 1939.

In all these countries excess profits taxes played major roles in the wartime tax program. While different approaches were made to the definition of excess profits the tax used in each of these countries was primarily a levy on

 $^{^8}$ The chancellor of the exchequer reported, 'today personal incomes below £500 represent nearly 85 percent of all personal incomes after payment of the income tax and surtax''

the increase in earnings over the prewar period. In the United States the statute provided an invested capital option. A similar option was used in Great Britain and Canada as an administrative relief measure. It is interesting to note that in the United States the treasury department urged repeatedly that invested capital be made the exclusive basis for calculating excess. However, congress did not adopt this proposal, and in effect the base period earnings method was the principal basis for calculation in the United States as it was in Great Britain and Canada. Postwar credits were used in connection with this tax in all of these countries.

World War II brought drastic changes in the individual income taxes. In all cases, rates were advanced to extremely high levels and the base of the tax was broadened substantially. Thousands of persons who had never before been subject to the individual income tax found their names on the tax rolls. In all cases this broadening of the base led to the adoption of a general system of collection at the source, and the bulk of the collections was put on a current basis.

In all three countries, provisions were attached to the levies on personal incomes which partook of the nature of forced savings. Those used in Great Britain were the most thoroughgoing. The Canadian arrangements were withdrawn before the end of World War II. Those used in the United States were of an embryonic character. They were attached to the so-called Victory tax and were withdrawn even before that tax was absorbed in the general income tax. In all cases, the forced savings arrangements were enacted in order to reduce the shock of a drastic broadening in the base of the personal income tax.

One corollary of the increase in the relative importance of the income taxes was a decline in the position of commodity taxation. In the United States, excises produced only slightly more than 13% of total tax revenues in 1945 as compared with 34% in 1939. In Great Britain, commodity taxes accounted for 17% of the total in 1945; 19% in 1939. In Canada, these taxes produced 29% of total tax revenues in 1945 as compared with 49% in 1939.

This decline in relative importance did not mean that commodity taxation was neglected. On the contrary, the yield of the excise system of the United States increased by 249% over the period 1939–45; that of the United Kingdom rose nearly 218%; that of Canada increased nearly 226%. During this period, the United Kingdom introduced a variety of wholesale sales tax known as the purchases tax. Canada, which had relied heavily upon a general sales tax during the 1930s, obtained substantial additional revenues from this source during the war period. There was constant pressure to adopt a federal sales tax in the United States, but no legislation of this sort was enacted. A spendings tax was proposed by the treasury in the United States in 1943, but met with little favour in congress.

Customs duties continued to decline in importance during World War II. They were most important in Great Britain, but even there the yield of the customs dropped from 25% to 18% of total tax revenues between 1939 and 1945. In Canada the yield of the customs duties made up only 5% of total tax revenue in 1945 as compared with 18% in 1939. In the United States, they accounted for less than 1% of the total in 1945 as compared with 6% in 1939.

Death duties also declined in relative importance. In

1945 their yield made up only 1.4% of the total in the United States and 3.6% in the United Kingdom. This also came about in spite of substantial increases in the rates applied during the war period. The new Canadian succession tax which was introduced during the war period produced a minor portion of the dominion's tax revenues in 1945.

By the end of the ten eventful years there had appeared in each of these countries a healthy trend away from deficit spending and towards a balanced budget. Between the end of the war with Germany and the end of the war with Japan, the federal government in the United States found it possible to reduce its expenditures by more than 50%.

This reflected a sound policy of retrenchment necessary to keep the credit of the country secure.

The task of the reconversion period is to determine what taxes retard production and employment and to devise ways and means for their elimination. The work of the congress of the United States for the accomplishment of these objectives was started in 1945, and gave promise of resulting in the establishment of a sound tax system for the postwar period.

BIBLIOGRAPHY.-Basic to an understanding of the tax history of the period 1937-46 are the budget messages in the United States, Great Britain and Canada. An understanding of the tax legislation of the United States also requires a study of the reports on the several tax bills prepared by the finance committee and the committee on ways and means, as well as the statements which the chairmen of these committees made when submitting the final bill to their respective chambers for ratification. These statements appear in the Congressional Record. See also R. G. Blakey and G. C. Blakey, Federal Income Tax (1940); A. G. Buehler, The Undistributed Profits Tax (1937); L. Crum, J. F. Tea

The International Tea committee was formed in 1933 to improve the tea industry, which had experienced alternate periods of prosperity and depression. The committee regulated exports and production and inaugurated a campaign to increase consumption. The U.S. was considered the most promising field for propaganda, and The Tea Bu-

⁹Except that in Great Britain statutory relief was granted to new companies through the invested capital method

TECHNICAL TRAINING * TECHNICOLOR

reau, Inc., was formed in New York to direct the publicity. On the outbreak of World War II these publicity activities were reduced. Under the Tea Control order of Sept. 1939 the British government took over all stocks of tea and later the ministry of food appointed a director of tea. The ministry of food made contracts with producers in India, Ceylon and East Africa covering quantities, prices, etc. In 1942 the ministry of food began to work under the Combined Food board at Washington and became the sole purchaser of tea for the Allies. Supplies were allotted to the armies, the trade and for shipments to neutrals. The threat of shortage in 1940 forced the British to ration tea to 2 oz. per week. Prices were also fixed, wholesale and retail. The U.S. tea supply came from India, Ceylon and East Africa; no Ethopian tea was imported, since there was no market for it. While coffee was rationed in the U.S., the consumption of tea increased slightly, but with the end of rationing the swing back to coffee occurred quickly.

World trade in tea in 1937 amounted to about \$70,000,000 lb.; divided as follows: India 354,000,000 lb.; Ceylon 234,900,000 lb.; Netherlands Indies 142,300,000 lb.; China 91,800,000 lb.; Japan 27,300,000 lb.; Formosa 16,800,000 lb. and Indo China 1,600,000 lb. The largest consumer nations were: Britain 449,000,000 lb.; United States 87,800,000 lb.; Soviet union 46,700,000 lb.; Australia 46,500,000 lb.; Canada 40,400,000 lb.; Netherlands 29,700,000 lb.; Eire 23,600,000 lb. The tea industry of China is ancient and universal, each province formerly growing small quantities for local use. The nation's total production was unknown but was estimated to be about 900,000,000 lb., or more than the trade in tea of the rest of the world. In contrast, tea culture was relatively new in other countries. In India the industry was begun by the East India company in 1600.

U.S. government appraisers setting standards of quality for tea imports at an annual meeting of the board in New York city. Meetings were suspended during World War II because of the reduction of varieties in teas imported

Most of the crop was grown by tea companies. In Ceylon tea culture was introduced when the coffee industry was wiped out in 1869 by a blight. Tea growing is an old industry in the Netherlands Indies but was of much later development in East Africa. Most of the plantations there were started after 1925. Only small areas had been grown in Brazil and Peru, although experiments on new varieties were under way in South America.

The United States imported a total of about 85,000,000 lb. of tea per annum during the decade ending in 1937. Following World War I, the imports had exceeded 100,000,000 lb. from 1915 to 1918 inclusive, but this increase was not all for consumption. The total for 1939 was 100,000,000 lb. In 1943, the tea committee of the Combined Food board reduced the U.S. allotment to 65,000,000 lb., of which 50,000,000 lb. was for civilians. In 1944 imports were up again to the average of prewar years—90,645,000 lb.—which dropped off to 89,542,000 lb. in 1945. United States per capita tea consumption changed little, but the U.S. armies in Britain came to consume more tea than usual. (J. C. Ms.)

U.S. Tea Imports, 1937-46 (In pounds)

1937-38	85,838,000	1942-43	51,840,000
1938-39	89,600,000		90,645,000
1939-40	100,119,000		89,542,000
1940-41	101,687,000		86,586,000
1941-42	94,429,000

292 Tedder of Glenguin, 1st Baron

Baron Tedder of Glenguin (Arthur William Tedder) (1890—), British air officer, was born July 11, 1890, at Glenguin, Sterlingshire, Scotland. He was graduated in 1912 from Magdalene college, Cambridge, where he took a degree in history, and in 1914 he was with the colonial service in the Fiji Islands. After the outbreak of World War I he joined the army, served in France and was later transferred to the royal flying corps. He was commander of the royal air force in the far east (1936-38) and was promoted to deputy commander in chief of the R.A.F. in the middle east in 1940. The following year he was made commander in chief of the R.A.F. over the vast middle east area.

Tedder was credited with having effectively co-ordinated the British air and ground forces during the preparations for the El Alamein offensive. In July 1942 he was promoted air chief marshal and the same year he was knighted. On Nov. 27, 1942, Tedder was promoted to vice chief of air staff of the R.A.F. and he was named air chief of the Mediterranean theatre Feb. 11, 1943. On Dec. 28 of that year he was appointed deputy supreme commander of Allied invasion forces under Gen. Eisenhower, and on Oct. 15, 1944, he assumed the additional post of chief of Allied air operations in western Europe.

He replaced Lord Portal as chief of the air staff and first senior member of the air council, Jan. 1, 1946 and was raised to the peerage the same day, as Baron Tedder of Glenguin.

Telegraphy

The first half of the decade 1937–46 was marked by continued development and more extensive practical application of many technical improvements already known to the industry but not fully exploited. In the latter half of the decade, orderly progress was arrested by the sudden demands of World War II. In the civilian field, wartime telegraph services were sharply curtailed and plant expansion was limited by shortages of materials, equipment and personnel. Military needs, on the other hand, required the establishment of thousands of special installations and accelerated technical developments along certain lines. Telegraph laboratories were devoted almost exclusively to the development, testing and manufacture of special equipment for war purposes.

In the years prior to the war, most of the technical advances aimed at increasing the speed, capacity and accuracy of telegraph service through the improvement and better utilization of printing telegraph equipment. Progress in this direction was accelerated during the war years by the tremendous strains imposed by the war on the U.S. telegraph system.

Technical Progress.—Maximum usage of trunk lines was achieved by the invention of "Varioplex" (see below) and by the expansion of the carrier system. Telegraph carrier equipment superimposed a number of different frequencies on a single pair of wires and made it possible to obtain from a pair of wires as many as 36 independent telegraph circuits, capable of carrying 288 messages simultaneously.

Improved types of repeaters, including electron repeaters, were developed for installation at intermediate points

in long circuits to strengthen electrical impulses and correct for signal distortion.

The facsimile method of transmitting telegrams, known as "Telefax," was highly developed, but wartime shortages of materials prevented large-scale manufacture and distribution of the special equipment required, except for military use. In this process, the original copy, carried on a revolving drum, was scanned by an electric eye, which transmitted for each minute area of the copy an electrical impulse that varied according to the relative darkness of the area. At the receiving end, these electrical impulses passed through a stylus, which traversed an electrosensitive recording paper moving at synchronized speed on the drum of a receiving machine.

The received copy required no processing and was ready for immediate use.

Automatic sending and receiving Telefax devices were developed for use in customers' offices to expedite the transmission of messages to and from telegraph offices. Other machines for public places permitted patrons to drop handwritten or typed telegrams into a slot. The machines would then transmit the telegrams in facsimile to the central telegraph office.

The use of Telefax was extended to the transmission of train orders by railroads and the rapid handling of reservations by air lines.

The facsimile system also was applied to submarine cable operation, and photographs, drawings and type-written matter were transmitted between Europe and the U.S. until the extraordinary demands of the Allied governments and military forces for communication by cable made it necessary to discontinue cablephoto service.

A wartime development of Telefax was its application to languages using other than the Roman alphabet. The hitherto difficult problem of sending telegrams in Chinese, with its thousands of characters, was solved by use of Telefax. Machines were shipped to China for modernization of important elements of its communications system.

A by-product of Telefax was the "Multifax," a business machine for the preparation of stencils and copies by facsimile methods. The machine, which could operate either within a single office or between two distant offices, prepared stencils of both text and drawings with absolute accuracy.

Facsimile transmission of messages was advantageously applied to radio in 1946 when Western Union inaugurated a marine news reporting service between pilot boats in the outer New York harbour and the main office building in that city. Officers on the pilot boat wrote on slips of paper data regarding the arrival of vessels and placed the slips in the transmitting cylinder of the Telefax machine installed in the wheelhouse. The messages were sent by radio beam to Western Union's marine news room, to be reproduced in facsimile. The news would then be flashed over the marine news tickers.

Another application of Telefax to radio telegraphy was the "Telecar," a mobile delivery unit developed to speed the delivery of telegrams in the outlying areas of large cities. The Telefax unit, mounted in a vehicle cruising about a prescribed area, received telegrams over the radio beam from the local main office for delivery directly to addressees within that area. As soon as the address appeared on the message, the "roving telegraph office" was on the way to make immediate delivery.

Sub-centre switching was perfected. Through this system a number of small branch telegraph offices or patrons' offices in a remote area, each having a private line to a local central point, could be automatically connected, over

a limited number of trunks, with a main telegraph office in a large city for the transmission of messages in either direction.

Some of the entirely new developments during the decade were of great importance to the future of the telegraph industry. Notable among these were reperforator switching, Varioplex and radio beam telegraphy.

Reperforator switching systems were installed in 5 key cities, and 25 were scheduled to be in use by 1950. Each would serve as a central point through which telegrams would pass to and from all places in the states or areas in which they were located. These systems eliminated manual resending of telegrams and ensured greater speed, accuracy and economy of operation. With this equipment, incoming messages, arriving in the form of perforations on a tape, were automatically switched to the desired outgoing circuit, simply by pressing a button, and were automatically sent on to their destinations without manual typing. This cut transmission time for relayed messages approximately in half and reduced the possibility of error.

The Telemeter service was developed to provide direct telegraph connections between pairs of teleprinter users in distant cities. This service was made possible by the invention of the Varioplex, a multi-channel telegraph system in which the total capacity of a circuit was divided among users actively transmitting over the line at a given instant instead of being divided equally among all users, idle or busy. By means of the Varioplex system, a number of pairs of users could be connected to a telegraph wire. It was possible to set up a large number of long, lightly loaded, private-communication circuits, which formerly had been impracticable. The service became known as Telemeter service because the charge was based on the volume of words sent as shown by an automatic word-count meter on each customer's line.

During World War II several departments of the U.S. and British governments were in instantaneous and continuous contact with each other between Washington and London over Varioplex facilities. The direct Varioplex channels between the U.S. navy and the British admiralty were especially useful in the war against submarines.

Frequency modulation was successfully applied to the operation of telegraph carrier systems. Signals were transmitted by varying the tone according to the telegraph code instead of interrupting the tone, as in amplitude modulation. This added to the reliability of carrier operation, since FM signals are less susceptible to atmospheric interference.

Radio-beam transmission was perhaps the most significant advance of the decade in telegraphy. Plans were made to establish radio-beam telegraph systems with high towers 30-50 mi. apart to interconnect the major cities in the U.S. Utilizing super-high-frequency radio waves transmitted by directional beam, this system would eventually eliminate the need for the familiar trunk pole lines and hundreds of thousands of miles of wire between main telegraph centres, although wires would still be used to link tributary towns with the main centres. The radiobeam telegraph would furnish a larger number of channels for the handling of telegraph traffic. By application of the carrier system to the radio beam, it became possible to send more than 2,000 telegrams in both directions simultaneously over the radio-beam system. Since atmospheric static does not exist in the microwave region, radio-beam transmission is unaffected by electrical disturbances. It practically eliminated interruptions caused by ice and wind storms and falling trees. It also cost less to install and maintain the beam system.

Antennas equipped with parabolic reflectors transmitted the signals in a narrow beam, using a power of less than 1 watt and frequencies of more than 4,000 megacycles. Since super-high-frequency waves travel in a straight line, they must be redirected at intervals to compensate for the curvature of the earth. Unattended repeater stations located in towers on hills or any available elevations in the ground automatically relayed signals without delay or interference.

Carbonyl powdered iron was developed as the principal ingredient of magnetic cores for high-frequency coils and transformers used in carrier systems.

Wartime Developments.—Many technical discoveries by telegraph engineers during World War II were the result of specialized research for the armed forces. In addition to their purely military value, some of these developments had important peacetime applications.

Telektypton, a cryptographic machine, automatically and simultaneously encoded messages as they were typed on the sending teleprinter, in Washington for example, and automatically decoded them as they were received in London.

Packaged telegraph units were provided by the telegraph company to the U.S. signal corps and were used with great success overseas. These were miniature semi-automatic telegraph stations designed to meet the army's need for a simple, compact and portable relay system for use in the field. Each unit combined sending and receiving sets and required only one operator. The unit could be placed in operation in 10 minutes without the use of tools, and as many as 20 units could be transported in a single truck. They were packed to withstand rough handling, vibration and immersion in salt water. Teleprinters were redesigned to increase the operating speed from the usual 65 words per minute to 100 words per minute for special applications.

An improved synchronizing method was developed for multiplex distributors, making it practicable to use four-channel multiplex printing telegraph equipment on long overseas radio circuits. This equipment, which allowed a circuit to be used for a number of high-speed channels, had previously been confined to land-line operation.

A by-product of telegraph laboratory research in wartime which was expected to find important uses in industry, apart from the field of communications, was the Western Union concentrated-arc lamp. This lamp contained permanent electrodes sealed into a glass tube filled with inert gas at atmospheric pressure. It provided an intense white light from a luminescent source as small as 0.003 in. in diameter, the nearest approach to a point source of light thus far obtained by science. It could be modulated, or dimmed and brightened, for signalling purposes, at frequencies of much more than 10,000 times a second. The concentrated-arc lamp had 5-10 times the brilliance and up to 100 times the life of a normal tungsten projection lamp of similar wattage. In addition to its use for telegraph purposes, the lamp was expected to find wide applications in such fields as photography, microscopy, optics and lensless projection.

Industrial Organization.—In 1942 the telegraph business of the United States was divided among the Western Union Telegraph company, which accounted for more than 70% of the national business; Postal Telegraph, Inc., which handled less than 20%, and the American Telephone and Telegraph company, which offered a national teletypewriter exchange service. In 1943, congress enacted legislation permitting the merger of domestic telegraph

companies. The Federal Communications commission approved an agreement for the consolidation of Western Union and Postal Telegraph on Sept. 27, 1943. The merger was consummated on Oct. 7, 1943. It eliminated the duplication of public telegraph facilities throughout the U.S. and established a single national system with uniform standards of efficiency.

Cable telegraphy was made more efficient during the decade by the application of printing telegraph equipment to the cables of U.S. companies, by the use of Varioplex, and by the introduction of improved vacuum tube amplifiers, measuring and balancing devices and repeaters.

Multiplex printing telegraph equipment was applied during the war to the submarine cables to Alaska, increasing their capacity 400%. A supplementary chain of cables, known as the Alaskan Communications system, was laid by army engineers to connect strategic islands in the Aleutian group.

World War II did not interfere with U.S.-operated cables in the Atlantic except to the extent that the U-boat menace may have impeded their usual speedy repair. To assist the Allied invasion of Normandy, the former German cable from Horta, an island in the Azores, to Emden, Germany, was picked up and swung over to Cherbourg, France, by the army communications service. It was then operated for military use, by direct connection with a Western Union cable from Horta to New York, to carry printing telegraph circuits extending from Washington to Paris.

As the result of several years of experimentation early in the decade, many miles of submarine cable were buried in the ocean bed to protect it from frequent and costly damage caused by trawlers dragging fishing nets along the bottom. The burying of cables was accomplished by means of a specially constructed plow attached by chain to the cable ship. The cable was fed through the plow into a trench which filled rapidly because of the washing action of the water. An instrument known as a depthometer was devised to determine magnetically the depth to which the cable was buried in the ocean bed. (See also Federal Communications Commission.)

Teleki, Pál

Count Teleki (1879-1941), Hungarian statesman, was born Nov. 1, 1879, in Budapest. His political career started in 1905, when he was elected to parliament. He was appointed prime minister and minister of foreign affairs in 1926, and in 1939 he was again named prime minister, retaining that post until his death. While Teleki was not averse to using Germany's might in winning back the lost province of Transylvania from Rumania, he nevertheless feared that a too great dependence on Hitler would jeopardize Hungary's independence. This misgiving was seen in the disclosure after his death that Count Teleki was one of the Hungarians who backed the book Why Germany Cannot Win the War, which broke all sales records in the country. But the German stranglehold on Rumania and Bulgaria in early 1941 placed Hungary in a precarious position.

Worried by the grave turn of events and by the impending invasion of Yugoslavia, the 61-year-old statesman committed suicide on April 3, 1941, in Budapest.

Telephone

During the ten years from 1937 through 1946, the telephone was called upon to meet unprecedented service demands, and telephone usage mounted steadily to higher and higher levels. The communications requirements of the nations of the world increased tremendously as they recovered from the depression of the early 1930s and climbed to dizzy heights as World War II spread out from Europe to global proportions. With the end of hostilities in the summer of 1945, the demand for telephone service, instead of diminishing, continued to increase.

As the decade began, the people of the world were being served by an estimated 35,028,682 telephones, or 1.63 telephones per 100 population. More than half, or 18,862,127 telephones, were in service in the United States and Canada. In the United States alone there were almost 14 telephones for each 100 people. Great Britain at that time was served by more than 2,500,000 telephones, or 5.4 telephones per 100 population. Europe had 36% of the world's telephones and Asia less than 5%.

People in the U.S. not only had more telephones than any other people in the world, but they used the telephone much more. In 1937 the average person in the U.S. made 197 telephone calls, as compared with 40 in Great Britain, 70 in Australia, 174 in Denmark and 152 in Sweden.

By 1946, the number of telephones in the world had increased to approximately 51,500,000, or 2.24 telephones per 100 population. More than 58% of this total, or 30,100,000 telephones, served the United States and Canada, and the number of telephones per 100 population in the United States had increased to 21. During 1946, the 4,000,000th telephone was installed in Great Britain, bringing its number of telephones per 100 population up to 8. Europe had 33% of the world's telephones, and Asia about 3%.

Great as were these increases, the gain in telephone usage was even greater. In the United States the average person carried on 284.4 conversations a year. Denmark and Sweden ran a close second with an estimated 243 calls per person. Elsewhere in the world the average was considerably less, although exact figures were not available.

Years of Recovery.—In the United States the period from 1937 to Sept. 1, 1939, when Germany invaded Poland, was one of moderate growth and of extensive improvement of telephone plant.

First of these improvements was the introduction into regular service of the combined handset telephone in 1937. This type of instrument combined the ringing apparatus and telephone into one compact set.

The conversion of central office equipment from the manually-operated type to the dial-operated type proceeded steadily both in the United States and Europe. In 1938 a new type of dial switching equipment designated as "crossbar" was introduced into the regular plant and thereafter was extensively installed in larger central offices. The name "crossbar" derived from the fact that strips of metal were placed at right angles to each other in such a way that they were caused to rock slightly by electric relays and thus establish contacts in obedience to the dial.

Although the important field of application for dial service was in switching local traffic, it was being employed for the completion of toll calls to an increasing degree both in Europe and the United States. Operator toll dialing had been in use in Switzerland and Belgium and in certain areas of the United States; and in 1938 two areas in the state of Ohio were converted from manual to dial toll. In this method of operation the outward toll

operator could complete the call without the help of other operators at the terminal of the toll line or intermediate switching points, by sending impulses over the toll line to the dial switching equipment at the other end.

By 1938, U.S. telephone engineers had demonstrated that the coaxial cable was an important instrumentality for providing more abundant long distance telephone circuits. In their hands, it had provided as many as 500 telephone channels over a distance of 2,000 miles. In some of the European countries—notably England, France and Germany—the coaxial cable had been more largely stressed as a conductor for the point-to-point transmission of television programs than as an adjunct to the telephone.

The coaxial cable operated on the "carrier" principle, enabling two pairs of conductors (each pair consisting of a wire surrounded by a concentric metal pipe and used to transmit in one direction only) to provide a large group of telephone channels or, alternatively, a single television channel, depending upon the range of the filters and the amplifying devices or repeaters with which the cable was equipped. In 1939 the first commercial installations of a coaxial cable got under way between Minneapolis, Minn., and Stevens Point, Wis., a distance of 200 miles.

By 1938, broad band systems of transmission by which 12 telephone conversations could be carried simultaneously on a single pair of open wires, or on two pairs of wires in cables, had been proved satisfactory in the United States and were going into extensive commercial use. Further research later increased the number of telephone channels provided simultaneously to 16 on one pair of open wires.

Most countries in Europe added to their long distance telephone cable networks prior to World War II, principally by the use of 12-channel carrier systems on existing cables.

In the United States, exchange telephone cables also were notably improved in 1939. As many as 4,200 wires of No. 26 gauge were placed within a lead sheath of 25% in. over-all diameter, an increase of 600 wires over the previous maximum.

During these years, overseas telephone service operating on an international basis experienced phenomenal growth. Inaugurated in 1927 with an overseas radio channel between the United States and England, the number of overseas radio telephone circuits for the handling of public message business had increased by 1937 to more than 175. At the time war broke out in Europe, 93% of the world's telephones, located in more than 70 countries or territories could be interconnected.

In Sept. 1938 the great hurricane which struck New England and parts of New Jersey and New York put about 600,000 telephones out of service, isolated about 500 communities completely from communication with the rest of the world, damaged or destroyed thousands of miles of toll wire, flooded central office buildings and brought transportation to a standstill.

Telephone forces in the affected areas went into action at full speed, but the damage was too great for them to repair it quickly. Within 48 hours, crews from other areas along the Atlantic seaboard, the middle west, and as far as Omaha, Nebr., had started to their assistance. Trainloads of men, fully equipped with trucks, tools and emergency supplies were en route to the affected areas; crews from nearby areas were rolling over the highways with their own trucks and equipment. More than 2,300 men with 600 vehicles moved into the stricken areas of New England to help the more than 7,000 telephone men there. They stayed there for weeks, working from dawn

to dusk, and longer, until the job was done.

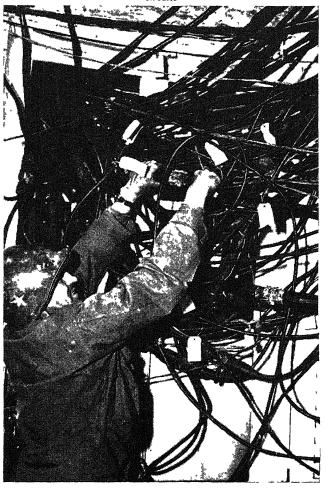

Defense Efforts.—Just one year later, man-made disaster struck in Europe. With it, a sudden great increase in telephone use took place in the United States. Practically overnight, the number of long distance calls increased 30% and passed all previous records. Nearly twice the normal number of calls were made to and from Europe.

First France, then England clamped rigid censorship on overseas circuits, only government calls being permitted. The volume of calls over the remaining circuits to Europe and to the rest of the world jumped instantly to new high levels.

Military establishments, government ordnance and munitions plants sprang up, many of them in remote rural areas where the existing telephone plant was inadequate to serve the new purpose. As this production effort expanded throughout the country, the demand for long distance service increased enormously.

Late in 1939 the Bell system authorized the construction of a new transcontinental cable, running 1,600 miles underground from Omaha, Neb., to Sacramento, Calif., and connecting at those points with the eastern and Pacific coast cable networks. This augmented the four existing open-wire lines west of Chicago, Ill., which then provided 170 circuits.

Network of Spiral-4 and other field cable at the 1st U.S. army headquarters on the Normandy beachhead in 1944. Each of the Spiral-4 cables could handle three telephone and four telegraph circuits

Other long distance facilities were extended in 1940 by about 500,000 circuit miles to help meet the unprecedented demands for long distance service. Approximately one-third of these circuits were provided by means of broad band transmission systems. At the end of the year, about two-thirds of all long distance telephone circuits were in cable.

At the same time, prudent measures were taken to safeguard telephone facilities. Reserve power equipment was installed or ordered at all important telephone central offices which did not already have it. The establishment of alternate toll routes between important points was speeded.

The telephone companies co-operated with the military in army manoeuvres and aeroplane warning tests and provided promptly the facilities needed at camps, air fields, arsenals and munitions plants.

The number of Bell system telephones in service increased 950,000 in 1940, at that time the largest gain ever recorded in one year, to 17,484,000. The total number of telephones in the United States at the end of that year was 21,860,000.

The average number of telephone conversations per day was 79,303,000.

By the end of 1940, overseas service to Belgium, France, Gibraltar, Greece, Luxembourg and the Netherlands was suspended because of World War II. Although transatlantic traffic fell off, calls to South America, Hawaii and Australia gradually increased, so that the total volume of overseas traffic was nearly as great as it was before the war. Facilities for additional circuits to South America were built, and facilities to the Caribbean countries were improved.

Coastal and harbour radio telephone service increased, with more than 2,500 vessels equipped by the end of 1940 for communication with any land telephone.

While these defense activities were going forward in the United States, the telephone personnel of England were grimly battling the blitz. The Germans started bombing Great Britain in April 1940. In the 11 months from Sept. 1940 to the end of July 1941, between 45,000 and 50,000 high explosive bombs fell on the London region; incendiaries were numbered in the millions.

At the same time, practically every other English city and town of any importance was visited by the bombers.

Telephone communication was seriously interrupted. In the London area alone between Sept. 1940 and Sept. 1941, bombs fractured 1,695 cables. Repairing this damage required the splicing of nearly 3,000 joints and connecting more than 500,000 wires. Damage to telephone exchanges ranged from broken windows to complete destruction in a few cases.

The demand for telephone service in the United States in 1941 was greater than in any preceding year. By the end of the year it was estimated that there were about 23,500,000 telephones in service in the United States, an estimated gain for the year of about 1,500,000, (more than 40% over the 1940 gain). The estimated average number of daily telephone conversations grew to 85,000,000, about 5,700,000 above the corresponding 1940 figure. The increase in toll calls was greatest in those parts of the country where defense activity was most intense.

To meet this unprecedented demand for telephone service, expenditures for new plant construction mounted to approximately \$420,000,000. This vast expansion, carried out in the face of growing shortages of a number of

materials, called for the use of substitute materials wherever they could be used effectively and for the conservation of existing facilities and materials to the fullest extent.

The War Years.—Starting in 1939 and continuing throughout World War II, conservation of vital materials and manpower was practised scrupulously in the United States by the telephone companies. By the end of 1943, the rate of use of strategic war materials showed the following savings over the high point of 1941: iron and steel 83%; nickel and zinc 91%; copper 93%; tin 95%; aluminum 98%; and crude rubber 100%. In one year alone, 20,000 tons of paper were saved in the printing of directories, one-third the amount normally used for this purpose. Foreseeing the shortage of telephone instruments, the telephone companies accumulated a stock pile of 750,000 telephone sets of all types.

In 1942, the manufacture of telephones for civilian use was stopped, not to be resumed until 1944, when a limited number of instruments were authorized by the War Production board.

To conserve manpower and offset the eventual loss of about 68,700 employees to the armed forces, the work week was lengthened in many areas, and streamlined maintenance schedules and practices were put into effect.

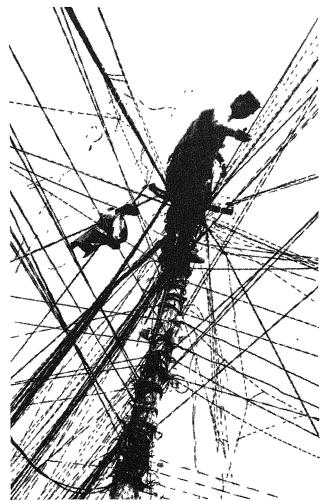

Camps, cantonments, airports and flying schools as well as ordnance and industrial plants, some as big as good-sized cities, were being built with remarkable speed. To provide telephone service for them frequently meant the building of cable routes miles in length and sometimes a complete new central office building and equipment. Many such projects were rushed to completion within one-third to one-half normal engineering and construction time. Altogether more than 7,000 switchboard positions and more than 600,000 telephones were installed in such establishments at a cost of nearly \$100,000,000.

From the beginning, the U.S. army and navy recognized the morale-building importance of telephone service for members of the armed forces. Public telephone service was provided in and near all military and naval establishments, and at nearly all larger camps attended telephone centres were built, providing pleasant, comfortable surroundings. Telephone centres also were maintained at army and navy hospitals, with additional conveniences such as bedside service and oversize booths for wheel chairs.

In further assistance to the army and navy, the telephone companies conducted plant schools where more than 7,000 army and navy technicians received training in switchboard installation and repair, teletypewriter service and line work; operated army switchboards, 3,000 operators being engaged in this assignment at one time; provided private line services which included 400,000 miles of intercity leased telephone and teletypewriter channels and 2,600 teletypewriter stations; helped the signal corps install communications facilities along the Alaska highway; and devised a radio teletypewriter system reaching to all theatres of action.

Work which was started late in 1939 on the buried transcontinental cable was completed in 1942, more than doubling the coast-to-coast circuits. Simultaneously, through use of open wire and carrier systems, 60 additional transcontinental circuits were provided prior to Pearl Harbor. More than 8,500,000 circuit miles of toll and long distance circuits were added during the war. Most of these miles of circuits were provided by the installation of carrier systems, which used a minimum of material.

A significant step in the development of automatic long

Telephone lines on Okinawa where U.S. army linemen helped to keep communication wires in order during the campaign in the Pacific

distance switching was taken in 1943, when a new toll office housing an automatic switching system particularly suited to handling toll and long distance calls in metropolitan areas was cut into service in Philadelphia, Pa. That year, too, an automatic ticketer was placed in service in the Los Angeles, Calif., area. With this device, the customer could dial direct over a toll circuit, and a ticket was automatically printed giving the full information necessary for charging the call.

Long distance traffic volume rose sharply during the war, total toll messages for the system averaging 80% higher in 1945 than in 1939, while longer haul calls tripled over the same period. In the face of critical shortages of facilities and operating personnel, such increases presented tremendous problems.

More switchboard positions and circuits were needed than could be provided. Many additional operators had to be recruited and trained. Changes had to be devised in engineering and operating practices to make more effective use of available circuits, switchboard positions and force.

On Nov. 1, 1942, by an order of the Board of War Communications, a toll priority plan was set up under which calls essential to the conduct of the war or to public health, welfare and safety were given precedence on the wires.

A second hurricane of great intensity caused widespread

destruction from Cape Hatteras to Maine in Sept. 1944. It put out of service more than 400,000 telephones and cut off nearly 50 communities from long-distance lines. With the help of nearly 1,000 men and 350 trucks and work cars from other Bell operating areas as far away as Ohio, construction and maintenance forces completed the general restoration of service in 12 days despite wartime shortages.

Return of Peace.—Following the end of World War II, it was possible to disclose some of the wartime research and production achievements of the industry. Telephone laboratories were revealed as major contributors to electronic developments such as radar, gun directors, rockets, torpedoes, guided aerial missiles, detection of submarines and magnetic mines. In all, more than 1,200 military projects were carried through to completion. In four years—1942 through 1945—telephone factories supplied to the government more than \$2,000,000,000 worth of communication, electronic and other specialized equipment.

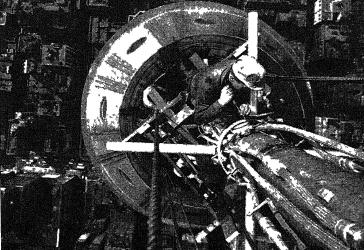

At the end of the war, more than 2,000,000 applications for telephone service were waiting because of lack of facilities. Furthermore, the new demand for additional service continued at a very high level. By a rapid reconversion of the telephone manufacturing establishments and by rapid building up of the depleted forces of the telephone companies, it was possible within a year of the war's end to increase the number of telephones in service by about 3,500,000. However, as the old applications were cleared up their place was largely taken by new ones, so that by the end of 1946 the decrease in the total number of waiting applicants was slight.

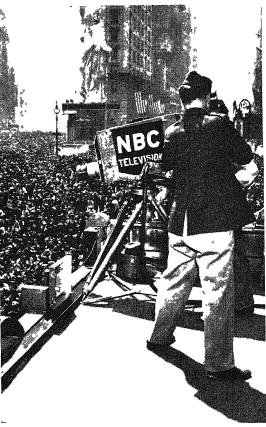

The Bell system's postwar construction program to restore adequate telephone facilities and to resume and extend the continuing programs, interrupted by the war, for the development and improvement of the telephone system was well under way by the end of 1945. Among other objectives, the program aimed to make telephone service available to 1,000,000 additional farm homes within a few years. As part of over-all plans to strengthen the long distance networks, about 1,500 miles of coaxial cable had been placed in the ground by the year's end, with several thousand more miles scheduled for completion in the next few years. Suitably equipped, this type of cable could transmit television or carry several hundred telephone conversations simultaneously. Such a system, therefore, not only provided needed additional telephone circuits in large quantity, but could also serve as the basis for a nation-wide television network.

Construction also advanced during 1946 on an experimental microwave radio relay system that was expected to be suitable for transmission of telephone conversations or television. Mobile radio-telephone service to vehicles, permitting two-way communication between mobile units and any regular telephone, was being provided as rapidly as equipment became available in major U.S. cities and on certain principal intercity highways. Progress also was made in the automatic long-distance switching program, the goal of which was to enable any operator to dial direct, without assistance of another operator, any telephone in the United States.

At the end of 1946, almost 120,000,000 calls a day were being made over the more than 30,000,000 telephones in the United States. Although a large number of applications for main telephone service still were being held awaiting the provision of facilities, many of these were filled within the year. Telephone factories were producing needed

equipment at the highest rate in their history, and heavily augmented installation forces were placing the new facilities in service in record time.

Without question, more telephone service was being furnished to more people than ever before in history, and every effort was being exerted to make the service better than it had ever been. (See also Federal Communications Commission.)

Television

The scientific advances in television insofar as they had become noticeable to the general public by the end of 1946 lay principally in the field of vacuum tubes. The orthicon and the image orthicon tubes announced in 1939 and 1945, respectively, were very sensitive pickup devices, the latter making possible the showing of scenes illuminated by twilight or candlelight. This greatly extended the scope of news and sports broadcasts. The development of more efficient "picture tubes" made possible in 1946 the building of commercial receivers adapted for use in well lighted rooms.

The use of mobile television vans for the relaying of special events programs was initiated in 1937. Scenes were televised and relayed by radio to the station for rebroadcasting. On April 30, 1939, mobile units were used to televise the opening of the New York World's fair, at which time Pres. Franklin D. Roosevelt became the first chief executive of the United States to appear on television. The V-J day ceremonies in Central park, New York city, christening of the aircraft carrier "Franklin D. Roosevelt" by Pres. Harry S. Truman, the Republican National convention in Philadelphia in 1940, the Louis-Conn championship boxing match in 1946, important football games, and other events were brought to the public by this and similar equipment. The Hooper survey reported that 141,375 persons saw the Louis-Conn fight by television. In 1945, largely as the result of wartime developments, this mobile equipment was supplemented by suitcase type units, which were used for many remote pickups.

Following an experience with air-borne television in 1937–39, the Radio Corporation of America and the National Broadcasting company, during World War II developed for the U.S. government two noteworthy applications of television. The "ring" system of air-borne reconnaissance television supplied to ground stations more than 100 mi. away detailed pictures televised from heights of 10,000 ft. and more. The "block" system utilized lightweight equipment for unattended operation in aircraft and guided missiles. In these and other ways, television participated in the Allied victory.

In another useful though less spectacular service, television was used to train air raid wardens and instruct them in methods of resuscitation and fire fighting. Receivers were placed in the New York police stations, and classes there were instructed by experienced personnel in the studios. In no other way could instruction have been given so rapidly and completely to so many.

As in war, so in peace, a number of school systems in 1946 ordered television receivers for classroom use and made arrangements with broadcasting stations for programs at times when they could be utilized by the schools. To this service was added the showing of special news

events, and of dramatic presentations, making these features part of the actual experience of the students.

Utilizing special types of kinescopes capable of pioneering brilliant pictures, theatre projection equipment was developed and demonstrated in 1941. A 15 ft. x 20 ft. picture was shown in the New Yorker theatre in New York on Jan. 24, utilizing scenes from Madison Square garden, Ebbets field and Camp Upton. The light from the face of the kinescope was reflected by a large spherical mirror, passed through a correction plate and thus projected on the viewing screen with a picture brilliance comparable to that of a home television receiver.

After extensive study by the Radio Technical Planning board and after public hearings lasting several months, the Federal Communications commission, in 1945, changed the frequency band for television from the assignments which had been in use for some years. The new allocation provided for 13 standard 6 megacycles (mc.) channels for commercial television in the band of 44 to 216 mc., and permitted the assignment of 16–20 mc. channels between 480 and 920 mc. for experimental transmission. The wider, higher frequency channels were provided in answer to the request for facilities suitable for the development of higher definition and for colour television.

During 1945 and 1946, manufacturers developed transmitters, receivers, special tubes and other equipment for the utilization of these frequencies. Studies were made of the propagation of signals in this little known region, and a beginning was made in determining how best to take advantage of this previously neglected part of the spectrum. These channels permitted pictures of increased clarity and gave room for the broadcasting of colour television, which required at least twice the frequency space of black and white television. Several manufacturers and broadcasters were experimenting with colour before 1940, and resumed this work after the end of the war.

The Columbia Broadcasting system, during the latter part of the period, was an active proponent of the early introduction of colour television, carried on extensive development and gave many demonstrations of its colour system. Late in 1946, the Columbia Broadcasting system applied to the FCC for a commercial licence for broadcasting colour television. This resulted in extensive hearings, discussion of standards and of the question whether or not colour television was ready for commercialization. These hearings were scheduled to be continued in 1947.

The system of colour television as demonstrated by CBS was like that of most other investigators in that it uses rotating colour filters at the transmitter and receiver. In Oct., 1946 the Radio Corporation of America demonstrated an all-electronic colour system wherein the signals representative of each of the three primary colours were simultaneously generated and transmitted. With this system one of the colour transmission channels (green) could be used to provide black and white pictures on a conventional black and white picture receiver. This system had the advantage that standardizing such a colour system would not render black and white receivers obsolete, as they could be adapted to receive in black and white the same picture transmitted in colour.

Many improvements in the received picture were made after 1941. On July 1, 1941, station WNBT became the first commercially licensed transmitter to go on the air. The number of lines in the picture were increased in 1941 from 441 to 525. This was followed by improved picture synchronization, flatter surface picture tubes, and brighter

pictures of better colour and contrast to give an over-all better result in the user's receiver. Many of these developments were commercially introduced in 1946 as the postwar receivers became available.

The use and value of television, so far as broadcasters and sponsors were concerned, was a function of the number of receivers in use. In 1940 the number was only a few thousand, all in the vicinity of the few stations operating in New York, Philadelphia, Chicago and Los Angeles. Later surveys indicated a large potential market, and production in the latter part of 1946 was on a scale not known before.

In 1937, the RCA and NBC experimental stationW2XBS was active, and several other organizations were making occasional broadcasts and conducting other experimental work. In Dec., 1946, in spite of the handicaps which had been imposed by war, and the long uncertainties with respect to standards, there were 7 licensed stations giving regular service, 2 experimental stations giving limited service, 47 stations for which construction permits had been issued by the FCC, and 21 applications for stations still pending.

Programs and methods for meeting program and operating costs were in the forefront of discussion in 1945–46. The various broadcasters were experimenting with many types of programs, and brought items of fine quality and high entertainment value to the public. Boxing, wrestling, football and other sports remained in favour, and a number of dramatic presentations set an excellent mark for the future. At the end of Sept. 1946, 22 large advertisers were sponsoring television presentations of interest to the public. With this kind of participation it apeared that commercial television with high quality of home entertainment was on a practicable basis.

Television shows, unlike those of the legitimate theatre, could generally be given once only, and thus involved high expense. Networks helped to spread the cost, and consequently they were part of television planning from the earliest days. Network programming also made available to people at great distances those news events, sports and high quality dramatic presentations which otherwise would be enjoyed only by those near a particular station. The frequencies used in television were such that they could not be relayed directly or by wire for long distances. Two solutions were possible-radio relays and coaxial cables, each with intermediate repeater or booster stations. The American Telephone and Telegraph company and others were actively at work along these lines. Radio relays were in use in 1946 at a number of points, and the coaxial line from New York to Washington was in use for connecting stations along the Atlantic seaboard.

The Westinghouse Electric and Manufacturing company, with the assistance of the Glenn L. Martin Co. and broadcasters, in 1946 began tests on "stratovision," in which the television signal was rebroadcast from a plane flying at high altitude, in order that a large area, including numerous cities, could be served by one transmitter for a given program.

One of the most spectacular applications of television in 1946 was its use in connection with the Bikini atom bomb tests. Television cameras installed about three miles from the explosions, as well as others on planes, picked up and broadcast the pictures to observers, and made possible the photographing of close-up views of the results.

(B. E. Sp.; G. L. Bs.)

British Television.-Television as a public service began

Training instructions for New York city's air raid wardens were televised and viewed by trainees on receiving sets installed at local police precincts

in Great Britain in 1936. Its first 10 years did not show the same rate of progress as sound broadcasting (which started in 1922), but six years of this period were war years.

The BBC television service that began in 1986 was the first regular service of entertainment value, but it was by no means the first essay in television. Experiments went back to 1929, when the BBC first lent its transmitter to the British inventor John L. Baird, who used a low definition system (30-line definition, medium-wave transmission, with a tall, narrow screen). High-definition, ultra-shortwave television came in 1936. By that time two rival systems were in the field, one promoted by Baird Television and one by Marconi-Electrical and Musical industries. When high-definition television began in 1936, both systems were used side by side. The first BBC television station was equipped with two complete systems, from studio to transmitter, one installed by Baird Television and the other by Marconi-E.M.I., the only common element being the sound transmitter. Programs were to be produced and transmitted by the two systems alternately.

The opening of the service was forestalled by a sudden demand for television entertainment at the Radio exhibition of Aug. 1936. With new equipment and untried techniques, programs were produced and relayed to the stands. Then in November came the formal opening of the station and the beginning of regular programs, and in Feb. 1937, the alternation of systems came to an end. The British postmaster general's permanent advisory committee on television recommended that the standards of the Marconi-E.M.I. system should be adopted. From then onward this remained the only television system used by the BBC.

From 1937, the BBC television station remained housed in one wing of a vast old entertainment palace on the heights of north London, 300 ft. above sea level. It had two studios, each 70 ft. by 30 ft. by 25 ft. high, one of them having four Emitron cameras and one three. Standards were 405 lines, 50 frames interlaced, giving 25 complete pictures per sec. Transmission was on 45 mc. per sec. for vision, 41.5 mc. per sec. for sound, with a peak white

power of 17 kilowatts (kw.) for vision and 3 kw. for sound. The transmitting aerials were mounted on a steel mast on top of one of the towers of Alexandra palace, which reached a height of 600 ft. above sea level. The effective range of the station had been estimated at a radius of 25 mi., but experience showed that reliable results were usually obtained up to about 35 mi. and in many cases much faither, the amount of local interference being the limiting factor.

From 1936 to 1939 this station provided regular programs afternoons and evenings, with an additional morning transmission of a demonstration film on weekdays for the use of manufacturers testing sets and dealers installing them. This film was transmitted on a "teleciné" apparatus designed for the purpose and consisting of two continuousmotion projectors, coupled up to two emitron cameras. Film newsreels and cartoon films were shown regularly, and film was used to provide special effects in live productions of plays, but generally the television service consisted of live programs, broadcast as they happened, either from the studio or from outside.

These prewar programs were extraordinary varied and ambitious. From the studios came plays, variety shows, cabaret, ballet, boxing and wrestling, discussions and illustrated talks. From outside, brought by special mobile units which constituted miniature television stations and sent their programs back to Alexandra palace for retransmission, came plays from London theatres, big sporting events such as the Derby, the association football cup final and the university boat race, public events like the coronation procession in 1937; this was the first television outside broadcast and one of the most memorable.

The number of homes equipped with television sets had risen by that time to some 23,000, according to a BBC estimate. Demand was growing fast; at the Radio exhibition of 1939, some 60,000 people placed orders for television sets. But before the exhibition was over, Germany had invaded Poland and Britain had issued her ultimatum. The television service ceased at the end of the morning transmission on Sept. 1, 1939.

During the six years of war, the transmitters were used by the royal air force, and one of their jobs was a fascinating form of air defense known as "bending the beam," by which German bombers were diverted from their targets. Even television research stopped as the whole resources of science and industry were turned to the immediate needs of war.

Long before the war was over, however, there were signs that television had not gone for good. In the autumn of 1943, the government set up a committee to advise on its resumption. The committee made its report at the end of 1944, and in Oct. 1945 the government indicated its acceptance of the main recommendations. These were that the service should be resumed from the prewar station, on the prewar standards, as soon as possible, with extension to the provinces and raising of standards to follow, and that it should again be run by the BBC.

The decision to resume on prewar standards meant that 1,000-line definition and colour would have to wait, but it also meant that there could be television in 1946. The service reopened on June 7, 1946, and on the following day the Victory parade was televised from the Mall.

From then on the home screens were kept alive with varied programs regularly every afternoon and evening (plus a morning demonstration film as before), transmission hours varying between 26 and 42 weekly, according to the number of outside events that fell outside the regular program hours. Thanks to the thorough overhaul be

fore the service was resumed, the pictures from Alexandra palace were clearer than before the war. Programs were more elaborate, more ambitious, rather longer in duration. The range of the station was still reckoned conservatively at about 35 mi. but there were more reports of good regular reception well outside that distance.

On the program side, difficulties arose with entertainment interests which regarded television as a competitor and therefore wanted to delay its progress, and there were big problems such as the conditions of big-screen rediffusion in theatres, which, at the end of 1946, had not yet been solved. There was also the question of extension to the provinces; the post office announced that a double link between London and Birmingham, by line and by radio relay, was well under way. There was the even bigger question of adopting higher standards of definition, in black and white or colour; when and what to change.

The first ten years of British television, even with the wartime gap accounting for most of them, showed at least in outline what radio could do when it appealed not merely to the ear but also to the eye. (See also FEDERAL COMMUNICATIONS COMMISSION; RADIO.) (M. A. C. G.)

Tellurium

The salient statistics of tellurium in the United States and Canada during 1937–45 were as follows, in thousands of pounds.

								Unite	Canada		
								Production	Sales	Stocks	Production
1937 .								51.4	23.4	93.2	41.5
1938 .								11.1	26.9	77.3	48.2
1939 .								25.2	63.4	39.1	23.0
1940 .								85.6	89.0	35.7	3.5
1941 .								224.6	240.0	20.4	11.5
1942 .								224.1	98.8	145.7	11.1
1943 .								56.2	62.3	139.4	8.6
1944 .								69.0	45.3	163.1	10.7
1945 .								80.8	60.3	183.5	42.0

Tellurium is a by-product in the refining of copper and lead. Production capacity with total recovery remained greater than demand. In 1941 and 1942, producers operated well up to the limit of capacity, apparently in the hope that war demands would absorb the extra output. However, while the uses of tellurium expanded appreciably, they still did not require anything like a full recovery.

Tellurium imparts better machineability and corrosion resistance to copper alloys; in lead it adds corrosion resistance, fineness of grain and greater strength; minute amounts in cast iron increase hardness and depth of chill. The leading use, however, continued to be in compounding rubber, to give greater toughness and resistance to abrasion.

(G. A. Ro.)

302 Temple, William

Temple (1881–1944), British divine, was born Oct. 15, 1881, at Exeter, the son of the Right Hon. Frederick Temple, 93rd lord archbishop of Canterbury. Educated at Rugby and Balliol College, Oxford, he was fellow and lecturer at Queen's College, Oxford, from 1904 to 1910, and headmaster of Repton school from 1910 to 1914, when he resigned to take charge of St. James's, Piccadilly. He was named bishop of Manchester in 1921 and archbishop of York in 1929. In 1942 he was enthroned as 96th archbishop of Canterbury. While still archbishop of York, Dr. Temple publicly criticized King Edward VIII for his determination to marry Mrs. Wallis Simpson. In international affairs, he advocated stringent but just measures for policing the axis countries after their defeat. He died at Westgate-on-the-Sea, near Margate, Kent, England, Oct. 26, 1944.

Tennessee

A south central state, Tennessee was 16th to enter the union, and is called the "Volunteer state." Land area, 41,-

961 sq.mi.; water area, 285 sq.mi. Population (1940) 2,915,841; rural 1,888,635; urban 1,027,206; rural farm 1,271,944; native white 2,395,586; Negro 508,736; foreign born 11,320; other races, 199. The bureau of census estimated the population on July 1, 1944, at 2,870,158. Capital, Nashville (167,402). Other cities include Memphis (292,942); Chattanooga (128,163); Knoxville (111,580).

Gordon Browning was governor at the beginning of the decade 1937–46. The legislature in 1937 adopted the county unit plan of voting.

Governor Prentice Cooper took office in 1939. Other state officers included the following: secretary of state, A. B. Broadbent; attorney general, Roy Beeler; commissioners as follows: agriculture, C. C. Flanery; conservation, J. Charles Poe; education, B. O. Duggan; finance and taxation, George McCanless; highways and public works, C. W. Phillips; institutions, A. T. Taylor; welfare, Paul Savage; insurance and banking, J. M. McCormack; labour, S. E. Bryant; public health, W. C. Williams; railways and public utilities, W. D. Hudson, Porter Dunlap and Leon Jourolman. The office of commissioner of

administration was discontinued in 1939, and institutions and public welfare were separated. The legislature passed a marriage law requiring premarital examinations. It also repealed the 30-year-old prohibition law, thus leaving package sale of liquor to local determination.

The Nov. 1940 election returns were as follows: president: Franklin D. Roosevelt (Dem.) 351,601; Wendell Willkie (Rep.) 169,153; Roger Babson (Prohibition) 1,606; Norman Thomas (Socialist), 463. U.S. senator: McKellar (Dem.) 295,440; Baker (Rep.) 121,790; Neal (Ind.) 35. Governor: Cooper (Dem., re-elected) 323,466; Bruce (Rep.) 125,254. Railway and public utilities commissioner: Porter Dunlap (Dem.) 278,793; Maddox (Rep.) 103,935.

Prentice Cooper, Democrat, was re-elected governor Nov. 3, 1942. Other state officials were as follows: secretary of state, Joe C. Carr; treasurer, John W. Harton; comptroller, Robert W. Lowe; adjutant general, Thomas A. Frazier; attorney general, Roy Beeler. Commissioners were as follows: agriculture, C. C. Flanery; conservation, J. Charles Poe; education, B. O. Duggan; finance and taxation, George McCanless; highways and public works, C. W. Phillips; institutions, A. T. Taylor; welfare, Paul Savage; insurance and banking, J. M. McCormack; labour,

S. E. Bryant; public health, W. C. Williams; railways and public utilities, W. D. Hudson, Porter Dunlap and Leon Jourolman. In the November election for the house of representatives, the Democrats polled 102,143 votes; the Republicans 52,368.

Mrs. Joe C. Carr became state treasurer in 1944. New commissioners included: Paul S. Mathes, education; W. O. Baird, institutions; William A. Shoaf, welfare; Dr. R. H. Hutcheson, public health; and John C. Hammer, railroad and public utilities. In the presidential election Roosevelt received 308,707 votes in Tennessee, Thomas Dewey 200,311, Norman Thomas 892 and Claude A. Watson 882 votes. James Nance McCord, Democrat, was elected governor.

Principal state officers in 1945, in addition to Governor McCord, Joe C. Carr, secretary of state; C. C. Wallace, treasurer; Sam K. Carson, comptroller; Rufus E. Fort, Jr., adjutant general; Roy H. Beeler, attorney general. Commissioners were as follows: agriculture, O. E. Van Cleave; conservation, Paul S. Mathes; education, Burgin Dossett (superintendent of schools, appointed by governor); finance and taxation, George F. McCanless; highways and public works, C. W. Phillips; institutions, Dr. W. O. Baird; welfare, William A. Shoaf; insurance and banking, James M. McCormack; labour, W. E. Jacobs, Sr.; public health, Dr. R. H. Hutcheson; railroad and public utilities, Sam Pharr, Leon Jourolman, John Hammer; safety, Lynn Bomar; employment security, W. O. Hake.

Governor McCord was re-elected to office in the elections of Nov. 1946. (C. E. A.)

Tennessee Valley Authority

The period 1937-46 saw the Tennessee Valley authority's greatest physical expansion. Construction of dams and reservoirs brought the Tennessee river under more complete control, for diverse purposes, than any comparable stream in the world. The rapid expansion dictated by World War II provided power for the production of atomic energy, aluminum, phosphorus, munitions and other war materials. TVA produced war chemicals and expedited the production of food, minerals and wood. The flexibility and initiative written into the TVA act by congress enabled it to shift emphasis from peace to war aims and back again, and to expand and contract its operations with a minimum of confusion and disruption. During the decade, TVA became the subject of national and world-wide study as a method of dealing with resources development on a unified and scientific basis and by democratic methods.

River Control.—In 1937 TVA had completed two dams, Norris and Wheeler. In the ensuing 10 years, TVA built and placed in operation 14 additional dams and reservoirs, 7 of them constructed as emergency proj-

ects to provide war power-Cherokee, Apalachia, Ocoee No. 3, Chatuge, Nottely, Douglas and Fontana. In 1942 TVA had under construction 12 dams and a large steam-electric generating station. Construction by force account made for speed and efficiency. Cherokee dam, built in 16 months, was closed 2 days before Pearl Harbor; by adapting Cherokee designs and using the same personnel and equipment, Douglas dam was built in 12 months. Fontana dam, fourth highest concrete dam in the world, was closed after less than three years and produced power in Jan. 1945. Kentucky dam, creating a 184-mi. reservoir in the lower Tennessee, was closed in Sept. 1944 and produced power the next month. Land and land rights were obtained on 1,759 sq.mi., in see or by easement. Under an appraisal and nonprice trading policy, contested condemnation suits represented only 6% of the total acreage. Extensive aid in relocating satisfactorily was given the 13,000 families required to move. Housing research in connection with construction resulted in designs for factory prefabricated and fully equipped sectional houses, of which more than 5,000 were installed at the Fontana project and at atomic energy plants in Tennessee and Washington. Planning assistance to communities affected by reservoirs led to extension of state and community planning to nonreservoir towns and cities.

TVA acquired four dams in the Tennessee valley by purchase in 1939 (plus a dam in the Cumberland valley). In Jan. 1945 it assumed, by agreement, direction of the operation of five major dams of the Aluminum Company of America. The integrated system of 26 dams provided a 640-mi. navigation channel from the Ohio river to Knoxville, Tenn.; provided 11,000,000 ac.ft. of storage for flood control on the Tennessee and lower Ohio and Mississippi rivers and, with associated steam-electric stations, had a generating capacity of more than 2,500,000 kw. installed.

Power.—TVA in 1945 and 1946 became the largest integrated power-producing system in the U.S., generating nearly 12,000,000,000 kw.hr. annually. TVA power was a major reason for locating the largest of U.S. atomic energy plants at Oak Ridge, Tenn. About 75% of TVA power annually went to war production, and an estimated 10% of the total war power of the U.S. was produced in the Tennessee valley. In July 1946 a peak demand of 2,038,000 kw. was established, as compared with the wartime peak of 1,982,000 kw.

In 1946, 138 municipal and co-operative distributing systems served 675,000 ultimate consumers with TVA power, as compared with 34 distributors and 30,200 consumers in 1937. Rapid expansion of the power market followed the decision of the U.S. supreme court in Tennessee Electric Power Co., et al. v. TVA, 306 U.S. 118 (the "18 company suit") that privately owned utilities had no legal right to be free of competition. This decision followed that in Ashwander, et al. v. TVA, 297 U.S. 288, in 1936, upholding sale of power from Wilson dam. Private utility properties serving about 345,000 customers were purchased by TVA and associated municipalities and cooperatives for approximately \$125,000,000.

TVA pioneered in rural electrification, with the result that farm service increased from 4% of total farms in 1932 to more than 25% in 1946. Farm customers in 1946 numbered 125,000. Postwar plans of distributors called for 30,000 mi. of rural line to serve 150,000 farm customers.

Résale rate schedules established in TVA wholesale power contracts in 1933 were in 1946 still about one-third

lower than U.S. electric rates generally. By mid-1946, 20 distributors had adopted still lower rate schedules. A comparison of typical residential bills follows:

Kw.Hr. per month	25	100	250
U.S. Average 1945*	\$1.37 0.75 0.75	\$3.89 2.50 2.25	\$7.09 5.00 4.13
TVA Rate R	0.75	2.00	3.50

*Federal Power Commission report, Typical Residential Bills: Cities of 2,500 Popula-

Stimulated by low rates and promotional activities, average domestic use of electricity by TVA power consumers grew from about 600 kw.hr. in 1933 (pre-TVA) to more than 1,850 kw.hr. in 1946, the average cost per kw.hr. declining from 6 cents to 1.8 cents. Average use in the U.S. over the same period increased from 600 to about 1,280 kw.hr., average cost dropping from 5.5 cents to 3.3 cents per kw.hr. In 1939, with sales of 1,618,287,000 kw.hr., TVA power operations commenced to earn an annual net income. Up to June 30, 1945, accumulated earnings after all power expenses amounted to \$55,105,000. In the fiscal year 1945, with operating revenues of \$39,-383,000 from sale of 10,315,000,000 kw.hr., net income was \$17,982,000. Return on the net average power investment was 4.8%. For the five years ending June 30, 1945, the rate of return was 4.1%. In the fiscal year 1945, municipal and co-operative distributors, with operating revenues of \$38,293,000 from sale of 3,023,000,000 kw.hr., earned a combined net income of \$7,265,000.

Flood Control.—Well-defined seasons of high and low rainfall and streamflow in the Tennessee valley enabled TVA to use much of the same reservoir space for reduction of floods and for maintaining flow in dry periods for navigation and power. Minimum dry season flow was increased at the mouth of the Tennessee sixfold, from 5,000 to 30,000 cu.ft. per second. Flood storage

provided by 1946 was sufficient to reduce crests at Cairo. Ill., on the Ohio and Mississippi rivers, by 2 to 4 ft. A TVA report in 1939 set the value of a 2-ft. reduction in the alluvial valley of the Mississippi at \$100,000,000-\$200,000,000. Reduction in flood crests added to the safety of cities, protected 9,375 sq.mi. from flooding and reduced frequency of floods on an additional 6,250 sq.mi. In the Tennessee valley, besides protection to agricultural lands and smaller cities, the TVA system substantially protected Chattanooga against a repetition of the flood of record (1867) which, if uncontrolled would do nearly \$40,000,000 in direct damage. TV\ reservoirs made possible complete protection of the city against a flood 50% greater than that of record by a future levee system.

Damage averted at Chattanooga up to 1946 totalled nearly \$11,000,000 in five floods, some of which would have hampered war production. This included a flood in Jan. 1946 which, uncontrolled, would have been the fifth largest in the city's history and the most destructive. Potential damage of \$6,600,000 was reduced to \$33,000 by lowering the flood crest 10 ft.

Navigation.—In 1939, the TVA had provided a commercially usable channel upstream to Chattanooga, and traffic volume trended sharply upward thereafter. By 1946 the channel was completed to Knoxville, except for a small amount of dredging and raising of Hales Bar dam to provide full nine-foot draft. Traffic increased from 44,000,000 ton-mi. in 1937 to 256,000,000 in 1945. Traffic included coal, wheat, corn, aluminum, fertilizer, automobiles, gasoline and oil, pig iron and steel products. In 1943-44 TVA placed in operation four public use general freight terminals and a coal terminal. Privately owned grain and oil terminals had been constructed. More than 125 new vessels, many of them ocean-going, were constructed on the Tennessee during World War II.

Notes: Power-generating facilities were provided at all but two projects, Nottely and Chatuge. The total TVA system installed capacity, including fuel plants and minor hydro plants not listed above, was 2,227,982 kw. at June 30, 1946; completion of new generating units under construction would increase the system installed capacity to 2,414,782 kw. The 1946 capacity of Alcoa plants was 311,120 kw., or a total of 2,539,102 kw. for the integrated system.

The lakes or reservoirs of the main-river projects on the Tennessee were designed to provide a channel for boats of 9-ft. draft from the mouth of the river to Knox"Purchased with other electric properties from the Tennessee Electric Power company.
†Useful controlled storage is the volume between the lowest operating level of the reservoirs and the top of the spillway or spillway gates.

Reservoir volume available for pondage, but not for seasonal storage operations.

Reservoir volume available for ponagge, but not for seasonal storage operations.

Maximum normal operating level.

Estimated cost included 1946 authorized units but was exclusive of switchyards, the total cost of which was estimated to be approximately \$32,500,000.

To mi. on the Clinch river; 56 mi. on the Powell fiver.

Construction deferred during World War II; resumed in 1946 under congressional appropriation.

Construction discontinued early in 1926; resumed in March 1929.

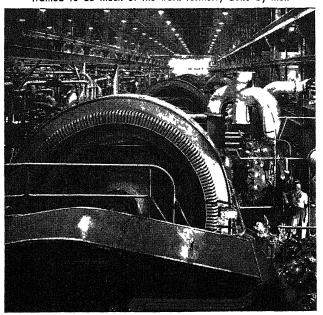

complemented its control in the river. Rainfall in the Tennessee valley averages 52 in. a year, or 6 tons per ac., and, falling on land traditionally devoted to intertilled crops, had done tremendous damage. In 1933 TVA, upon the advice of the U.S. department of agriculture and the land-grant colleges, embarked upon the development, experimental manufacture and large-scale testing of new and improved phosphate fertilizers, since phosphorus is a key mineral in which many soils are deficient.

Chemical Operations.—In the chemical plant at Muscle Shoals and a plant built in middle Tennessee, TVA developed and manufactured three different types of phosphate fertilizers—calcium metaphosphate (65% plant food), concentrated superphosphate (48%) and fused tricalcium phosphate (28%). Potassium metaphosphate, containing 90% plant food, was developed through the pilot plant stage. All but concentrated superphosphate, previously manufactured by a wet process using sulphuric rather than phosphoric acid, were new products. Shipments during the ten-year period ending June 30, 1916, were as follows:

		For TVA Test- Demonstrations and AAA (Tons)	For Lend-Lease (Tons)	Other
Concentrated superphosphate		451,631	94.394	22.048
Calcium metaphosphate		53,989	3.801	126
Fused tricalcium phosphate		10,352	0	21

War Production.—TVA research in electric-furnace production of phosphorus encouraged expansion of private capacity, so that great quantities of military-grade phosphorus were available in World War II as compared with World War I. TVA produced 58,700 tons, including 4,600 tons for lend-lease, which was a large proportion of total U.S. output. Using rehabilitated graining facilities plus a new ammonia plant, TVA produced up to June 30, 1946, 464,000 tons of ammonium nitrate, 75,000 tons for munitions use and the remainder for fertilizer. A TVA-developed process for conditioning ammonium nitrate for fertilizer use was adopted by other government munitions plants. About 43,000 tons of synthetic ammonia were sent to other munitions producers. TVA made more than 250,000

Ammonia for explosives being produced at Nitrate Plant No. 2, Muscle Shoals, Ala. During World War II, women workers were trained to do much of the work formerly done by men

tons of calcium carbide for use in synthetic rubber manufacture. A plant was built, largely of scrap materials, to produce dicalcium phosphate for cattle feed supplement. Manufacture of ammonium nitrate and dicalcium phosphate continued in 1946 to help meet critical shortages.

"Whole Farm" Test-Demonstrations. — Tests demonstrations of TVA fertilizers went beyond testing of fertilizers per se and included the use of minerals in conservation and soil building. The test-demonstrations were carried out by practical farmers, selected by their neighbours or participating in area demonstrations, under the general supervision of the agricultural extension services of the states and with the assistance of their county agricultural agents. TVA provided the phosphate fertilizers free except for freight charges, in return for which farmers developed soil-conserving farm plans, kept records and measured results. Farm test-demonstrators increased from about 12,000 in 1937 to 38,900 in 29 states in 1946.

Marked changes through use of soil minerals and improved farm management included reduction of row crops and shifting such crops to less erosive land, use of winter cover crops, reduction of soil and water losses, increased pasture and hay crops leading to more and better livestock and increased production of more nutritious food for animal and human consumption.

Forestry Development.-Woodlands in 1946 covered 21,875 sq.mi., or more than half the valley, 43% on nonfarm holdings, 40% on farms and 17% publicly owned. Co-operating with federal, state and county agencies, TVA encouraged modern forestry practices in a region in which few examples existed prior to 1941. More than 400 demonstrations of sustained-yield forest management were established in co-operation with commercial timber operators and farmers, who obtained both immediate and long-term benefits in better forest operation. Organized fire control was extended to 18 counties, and TVA co-operated with state conservation commissions in extending control to 5,469 sq.mi. Two TVA forest nurseries provided 154,000,000 seedlings for planting upon both public and private lands needing reforestation and erosion control. Erosion control demonstrations were established in every valley county.

Other Benefits.—To meet malaria hazards resulting from reservoir construction, TVA developed a large-scale mosquito control program, teaming medical, biological and engineering sciences. Methods included water-level fluctuation, diking, filling and dewatering projects and spreading insecticides from planes, boats and shore. Blood samples taken in reservoir areas showed reduction in the incidence of malaria from 10% in 1939 to less than 1% in 1944. Methods developed by TVA were adapted by the U.S. army during World War II. TVA equipped 12 planes and trained pilots for the United Nations Relief and Rehabilitation administration's malaria control program in Greece.

By 1945 5 state, 8 county and 10 city parks had been established on land leased from TVA. More than 50 boat docks were in operation. Surveys indicated that fishing had increased 50-fold on storage reservoirs and 15-fold on mainstream reservoirs. Biological research by TVA, showing that only a small proportion of fish were being caught, led to discontinuance of hatcheries for stocking reservoirs and to elimination by state conservation commissions of closed fishing seasons on all TVA

waters. Approximately 180 sq.mi. of TVA land were incorporated in federal and state game refuges, migratory waterfowl refuges predominating.

Research.-To implement development of resources, TVA carried on research directly and, more extensively, co-operated with existing agencies in research directed at specific regional problems in the fields of agricultural engineering, minerals development, food processing, forest products and so on. Developments included, for example, a small portable thresher adapted to the hills and small farms characteristic of much of the valley, giving impetus to growing of small grain and legume crops, and providing a machine for manufacture by private industry. A barge-borne food-processing laboratory provided new processes and guidance in handling perishable products for market, thus helping develop a new foods processing industry in the valley. Minerals research increased use of pottery clays and vermiculite, among other minerals. Three TVA studies in 1937, 1939 and 1943 gave impetus to the movement for abolition of freight rate discrimination between regions. These were typical of activities by which TVA assisted other agencies, public and private, in the field of resources development.

Personnel.—Peak employment was nearly 42,000 in 1942, declining with reduced construction activities to 11,000 in 1946. Employees, under the act, were selected on the basis of merit and efficiency and without political qualification. Collective bargaining procedures were formalized in 1940 in a general agreement with 14 A.F. of L. unions forming the Tennessee Valley Trades and Labor council. By 1946 seven unions were negotiating for TVA "white-collar" workers.

Finances.-Congressional appropriations to June 30, •946, were \$677,617,270; bonds had provided \$65,000,000 and assets transferred by the war department were about \$39,000,000. About \$100,000,000 in receipts had been reinvested in power facilities, particularly during the wartime expansion. In Dec. 1945 TVA paid into the U.S. treasury general fund \$12,600,000 representing excess of receipts over requirements of programs financed out of revenues. Congressional control over TVA was exercised through the annual budget procedure, in which TVA presented plans for programs financed both by revenues and appropriated funds, through annual audits by the comptroller general and through submission of an annual report. TVA accounting followed business rather than governmental patterns, and power accounts were kept in conformity with the uniform system prescribed by the Federal Power commission for all utilities.

The TVA board in 1946 consisted of David E. Lilienthal, chairman (resigned Oct. 28, 1946), Dr. H. A. Morgan, vice chairman, and James P. Pope. The TVA act provided for administration by a board of three directors appointed by the president and confirmed by the senate for staggered nine-year terms. (See also Dams.)

Tennis

Three facts had become clear in the world of lawn tennis by the beginning of the decade 1937-46. First, the hold which France and then England had kept upon the Davis cup for ten years was seriously threatened by the rising strength of younger players in the United States and Australia. Second, the men who had dominated the game during that period, Henri Cochet, Jean Lacoste and Jean Borotra of France, William T. Tilden and Ellsworth Vines of the United States, J. H. Crawford of Australia, and Fred J. Perry and H. W. Austin of England, had either reached and passed their peak, or else turned professional. A new lot was surging forward, youngsters like J. Donald Budge, a dynamo in the best Californian tradition, Gottfried von Cramm, a classicist from Germany of the Froitzheim school, Adrian Quist, a brilliant Australian, and his compatriot, John Bromwich, who hit the ball with two hands on his racket. From them were coming the champions of the following decade.

Perhaps even more significant, however, was the fact that at last the dictators had discovered sport. By then it had become apparent to the overlords of Europe that winning a heavyweight boxing title, an international soccer championship, a Wimbledon trophy, or better still, the Davis cup, was a matter not merely of sporting but of national prestige. Stars of the game were aided by subsidies and governmental assistance of every kind. Champions—when victorious—became national heroes and heroines. Curiously, defeat did not enter into the scheme of totalitarian sport. One was not sent upon the field of sport to lose.

This was shown by the summer of 1937, and more obviously still in 1938. In that year the German Davis Cup team, after winning the European zone, was unexpectedly and badly defeated in the Interzone final of the series in the United States. Hitler probably ordered the team to return. At any rate they left immediately, without competing in the American championships several weeks later in New York, as had been planned.

On the sporting side, perhaps the rise of redheaded Donald Budge, the Californian with the McLoughlin service and the all-court game, was the most important single item of these ten eventful years. Here at last was a real successor to the mighty Tilden, and a worthy one too. By 1937 he had come into his own, capturing the Wimbledon and United States titles, and losing only three sets in all in so doing, two of them to Cramm in the finals at Forest Hills, Long Island, N.Y. Winning all his singles matches and carrying along an indifferent partner in doubles most of the time, he was the principal artisan of American victory in the Davis cup, thus returning the trophy to the land of its birth for the first time in a decade.

During the next season, 1938, he dominated the field of tennis as perhaps no one had done before. Starting in January, Budge won the Australian title in Adelaide, South Australia, the French championships at Paris in June, the All-England title at Wimbledon in July, and the U.S. at Forest Hills in September. He also helped materially by his two victories in singles to defeat Australia in the Challenge round of the Davis cup at Philadelphia, Pa., that same month. It was a remarkable athletic feat, one that had perhaps never before been equalled by any tennis champion.

Meanwhile, in women's as in the men's field, new faces

were appearing on the courts. The players who had ruled the game in the United States and abroad were passing. Alice Marble in the United States, Amita Lizana of Chile, and younger stars of both England and North America were coming to the front. However, in 1938, Mrs. Helen Wills Moody, after an absence from action for three years because of an injury, decided to return to active competition again, and entered the All-England championships at Wimbledon. From the strongest field in many seasons, including Miss Marble and Helen Jacobs of the United States, Dorothy Round and K. E. Stammers of England, Simone Mathieu of France, Hilda Sperling, the German star, and Mrs. Bobbie Heine Miller, the South African champion, Mrs. Moody came through to victory without the loss of a single set.

This was surely the most amazing feminine sporting achievement of the year.

In the summer of 1939, on the eve of battle, a hollow and ominous tone echoed over the tennis courts of the world. The quality of play fell off almost as if in sympathy with the times. Budge had turned professional and there was no outstanding star to replace him, no one like the Tilden of 1930, the Vines of 1932, the Crawford of 1933, the Perry of 1934 and 1936, and the Budge of 1938. There were only a number of mediocre players in different lands.

Thanks to Herr Hitler's timetable, all the major tennis championships were completed and the Davis cup, as on the eve of World War I, finished just as the guns began. History repeated itself. In 1914, Norman Brookes and Tony Wilding took the cup from the United States. In 1939, the Australian team of Bromwich and Quist beat an American side without the cannonball delivery of Donald Budge. Thus after 25 years the trophy returned to the antipodes.

From 1940 to 1946, tennis, like other sports, was a matter of small importance. As in World War I, the Davis cup contests were abandoned. All championships, save those in the United States, were given up. Not until 1946, the year after hostilities ended, was a general resumption of play possible.

The United States was the only major tennis-playing nation to continue tournaments, both before and even while the nation was at war. Although golf, polo and most ama-

Sarah Palfrey Cooke won her first U.S. women's singles championship, defeating Pauline Betz in straight sets Sept. 7, 1941, at Forest Hills, L.I. teur sports gave up their title events, tennis continued as usual. After 1942, the national championships consisted largely of servicemen on leave or fortunate enough to obtain permission from a commanding officer to compete.

Perhaps the most interesting feature of the period was the rise of Alice Marble of California. She won the Wimbledon and United States titles in 1939, and in 1940 repeated her triumph at Forest Hills, smothering Helen Jacobs, a former champion, with the loss of only a couple of games in the two sets. No woman had ever played such a starkly masculine game as Miss Marble; her service, court-covering, volleying and driving were as forceful as that of most men.

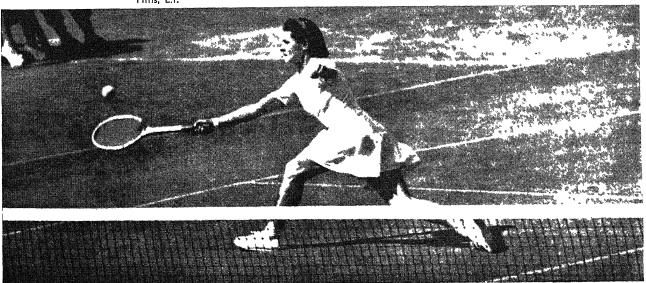

In 1946, the French, English and U.S. championships were held, the latter title being won by John A. Kramer, a young Californian who had been victorious in the same event in 1943 before going into the navy. For the first time since 1939, matches for the Davis cup were also resumed, with Sweden winning the European zone by defeating Yugoslavia, and the United States, the American zone.

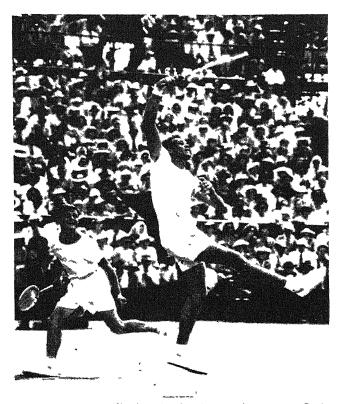

In the Interzone final, played at Forest Hills in September, the United States beat Sweden five matches to none, thus earning the right to face Australia, holder of the cup, in the Challenge round.

The U.S. captain was faced with a difficult decision in choosing a team to represent his country in the Challenge round. He had a squad of five fine players, three of whom, Frederick R. Schroeder, John A. Kramer. and Frank Parker, had all held the singles title of the United States. He finally decided to depend on two men only—the first two-man team to play for the United States in the Challenge round since William T. Tilden and William Johnston took the trophy from Australia in 1920.

His decision was a wise one, and history repeated itself. Notwithstanding the handicap of playing in a strange land under the torrid Australian sun, the U.S. team of Schroeder and Kramer, teammates and doubles champions of the United States in 1941, dominated play completely. They won four of the five matches with the loss of but two sets, and were never, save in one contest, seriously threatened.

The Challenge round was played on Dec. 26, 27 and 30, 1946, at the Kooyong stadium, near Melbourne, before ca-

Frederick Schroeder (left) and John Kramer, the two-man Davis cup team which defeated Australia in the Challenge round held in Dec. 1946, near Melbourne

pacity crowds. The issue was practically settled the first afternoon, when Schroeder beat John Bromwich of Australia in five sets, and Kramer defeated Dinny Pails. The two sets lost by Schroeder were the only ones taken by the Australian side in the three days.

Most remarkable was the straight set victory of the U.S. team in doubles. For the preceding 40 years Australians had had a higher average standard in doubles than any other nation, and Bromwich and Adrian Quist were a veteran pair who had been victorious in two previous Challenge round contests played in the United States betore World War II. However, they were no match for Kramer and Schroeder, and were beaten in three quick sets in a little more than an hour's play. It was the first defeat in doubles for an Australian team in a Challenge round since 1926.

This third victory gave the United States possession of the Davis cup, and the two remaining contests could not affect the decision. Kramer defeated Pails in three sets, and Gardnar Mulloy, substituting for Schroeder, was victorious by the same margin over Bromwich. This was the 13th time the United States had been victorious in the 34 years of play since the matches started in 1900.

Terauchi, Juichi

Count Terauchi (1879–1946), Japanese army officer, was born in Yamaguchi province. His father was an army field marshal, premier of the Japanese cabinet and governor-general of Korea. The son, after serving in various high army posts, became a member of the Supreme

War council in 1935. He was named war minister in the cabinet of Premier Koki Hirota in March 1936, but his refusal to permit the diet to criticize the army resulted in the downfall of the Hirota government, although he retained his post in the succeeding cabinet. Terauchi left the cabinet in Feb. 1937 to return to the army as inspector-general of military training. Later that year, he became commander of Japanese forces in North China and directed the victorious Japanese offensive along the Peiping-Hankow front. Shortly after Japan's attack on Pearl Harbor, in Dec. 1941, Emperor Hirohito named Terauchi commander of all Japanese forces in the Southwestern Pacific.

After Hirohito's surrender broadcast (Aug. 15, 1945), Terauchi failed to comply promptly with Lord Louis Mountbatten's order to send surrender envoys to Rangoon. On Nov. 30, 1945, he formally surrendered at Saigon and was moved to Malaya where he died at his quarters in Johore Bahru, of a cerebral haemorrhage, on June 12, 1946.

Territorial Army, British

At the beginning of 1937, the British territorial army was composed of 14 divisions and army troops with an establishment of 196,075, and although the actual strength was only 141,153, this marked a modest revival as compared with previous years. The improvement was partly because of small concessions on the part of the treasury, but far more because of a growing appreciation in the country that Adolf Hitler and naziism were a menace to the peace of the world. The Munich agreement of Sept. 1938, when the anti-aircraft defenses were first mobilized, encouraged recruiting for all branches of the T.A., and thenceforward manpower ceased to be a difficulty. Unfortunately, however, there still remained the problem of equipment.

Although horses had for the most part given way to machines, the actual armament of the T.A., apart from anti-aircraft equipment, had remained practically unchanged since World War I and the manufacturing potential for which the army council importuned had not been provided by the government. Consequently, when in 1938 a scheme for a complete reorganization on modern lines was at last accepted, the means to put it into effect did not exist. Early in 1939, it was decided to raise the T.A. from peace to war establishment, and then to double it. This meant increasing the establishment to 437,349, and the men required came forward readily enough, thereby making the equipment position even more difficult. Indeed this measure, like the introduction of conscription a few months later, was more of a political gesture than an immediate addition to Britain's armed strength. Both were in the nature of a warning to Hitler that the British intended to make a stand, and although these gestures failed to check him, they were of great importance since they formed the basis for the expansion of the land forces on mobilization.

Another useful step was the creation in 1938 of the women's organization, the auxiliary territorial service (A.T.S.) which as the WAAC had been disbanded after World War I. The emergency service and the field army nursing yeomanry (F.A.N.Y.) had continued to train at their own expense, eventually providing many officers for

the 307,000 women who passed through the ranks of the A.T.S. and who proved invaluable in releasing men for front line duties, or in performing those duties themselves. (See British Women's Services, World War II.)

On the declaration of war in 1939, the T.A. assumed complete responsibility for the coast and anti-aircraft defenses of Great Britain; its efficiency in this work reached its zenith in 1944, when over 90% of flying bombs were brought down by fire from the ground defenses. By the spring of 1940, 11 territorial divisions were with the field armies overseas. In Norway, in Belgium and in France they fought in retreats to the coast and in subsequent evacuations; a territorial battalion took part in the heroic detense of Calais. All suffered from a lack of armour and anti-tank weapons and their casualties were consequently very heavy. Later on, territorial divisions and units served on every front. As the war proceeded the necessity for replacing casualties by the wartime intake tended to affect the purely local character of many units, but despite this they retained their territorial connection. Thus the tradition and the spirit of the original volunteers survived.

By the end of 1946, all territorial divisions overseas were broken up; the government announced its intention to reform the T.A. and to include in it as many as possible of the original units which existed from 1908 to 1937.

Teschen

Before 1918 this European city and district had been part of the Austro-Hungarian monarchy; it was subsequently disputed between Czechoslovakia and Poland. The duchy of Teschen (Těšin) was originally ruled by Polish princes but became a part of the lands of the Bohemian crown in 1335. It is of great strategic and economic importance. It is the watershed between the Vistula (Baltic sea) and the Danube (Black sea) and the crossroads of the railroads from Berlin to Budapest and from Vienna to Warsaw. In its territory are important coal mines on which Czechoslovak industry largely depended.

Czechoslovakia and Poland first disputed Teschen in 1919. Its area was then 881 sq.mi., its pop. (1910) 426,000, of whom nearly 55% were Polish-speaking, 27% Czech-speaking and 18% German-speaking. The council of ambassadors decided on July 28, 1920, to partition the territory, and the solution was accepted, though against Polish wishes. Czechoslovakia received 491.5 sq.mi., with a pop. (1921) of 310,183. The city of Teschen was divided, the larger part, east of the Olsa river, going to Poland.

The weakness of Czechoslovakia at the time of the Munich crisis in 1938 was used by Poland to present an ultimatum to Czechoslovakia for the Czechoslovak part of the Teschen district. The territory annexed by Poland in Sept. 1938 amounted to 419.3 sq.mi. with a pop. of about 230,000, of whom 120,000 were Czechs and 76,000 Poles. In 1945 in spite of all protestations of Slavic brotherhood and in spite of the fact that both governments were Russian controlled, the struggle for Teschen flared up with undiminished violence between the two governments. The Polish army occupied the territory on June 19. The Czechoslovak government immediately protested. It declared that any cession of the territory to the Poles would affect the most vital interests of Czechoslovakia. (H. Ko.)

Texas

A south central state of the United States, Texas was admitted to the union as the 28th state on Dec. 29, 1845; popularly known as the "Lone Star state." Area, 263,644 sq.mi. of land and 3,695 sq.mi. of inland water surface. Population (1940) 6,414,824 including 3,503,435 or 54.6% rural and 14.5% Negroes and other nonwhites; 6,179,296 native and 235,528 foreign-born, principally from Mexico. The population was estimated at 6,876,248 on July 1, 1944. Capital, Austin (87,930). The four largest cities were Houston (384,514); Dallas (294,734); San Antonio (253,-854); Fort Worth (177,662).

The principal state officers at the beginning of the decade 1937-46 were: James V. Allred, governor; William McCraw, attorney general; George H. Sheppard, comptroller; Charley Lockhart, treasurer; Edward Clark, secretary of state; Claude D. Teer, chairman board of control; L. A. Woods, superintendent of public instruction. The state legislature was in regular session Jan. 12-May 22, 1937, with called sessions convening in May and September. In politics, Texas remained strongly Democratic, with the Democrats divided into liberal and conservative wings. During the legislative sessions there was a sharp contest between the liberals, controlling the house and led by the governor, who demanded higher taxes upon the corporations exploiting the state's mineral resources, and the conservative senate, which preferred a general sales tax. Enlarged appropriations without new taxes increased the deficit in the general fund to approximately \$17,000,-000; but other funds had surpluses which aggregated about the same amount. Important laws enacted included those giving cities power to regulate public utilities therein and reducing the rate of return on utility investments from 10% to 8%; permitting the commitment of insane without a court trial; setting up a teachers' retirement system, but failing to provide the state's share in financing it, and repeal of the law permitting betting at race tracks. Constitutional amendments increasing the salaries of state officials and providing pensions for indigent persons above 65 years of age went into effect in 1937.

The biennial state elections of 1938 introduced a new political figure, W. Lee O'Daniel, a Fort Worth flour merchant, who was elected governor on a platform for liberalizing the old-age pension system and for promoting industries in the state. Under the pension system about 114,000 of the neediest persons more than 65 years of age received an average of \$13.90 monthly (half paid by the U.S. government), while O'Daniel advocated paying all persons more than 65, \$30 per month (half by the U.S.). Among other newly elected state officials were: Coke R. Stevenson, lieutenant governor; Gerald C. Mann, attorney general; Richard Critz, justice of the supreme court; G. A. Sadler, railroad commissioner, and Bascom Giles, commissioner of the general land office. All elected officials were Democrats. The 45th legislature did not meet in 1938.

Controversy over the governor's social security program made the session of the 46th legislature, which opened in Jan. 1939, one of the most turbulent. A bill known as Senate Joint Resolution 12, sponsored by the governor, would have submitted to popular vote a constitutional amendment embodying a sales tax and a tax on natural resources, but with a permanent ceiling on the latter that could not be raised. The measure was opposed by 56 members of the lower house, sufficient to prevent pas-

sage. Another bill, passed by the legislature and signed by the governor, added 50,000 old-age pensioners to the 118,000 already on the rolls, but no money was appropriated, and the sums received by the pensioners decreased within the year from an average of \$14 to about \$8 per month. For the first time in many years there was no special session of the legislature since the governor refused to call one.

In the presidential election of Nov. 1940, the Democratic candidates carried Texas by an overwhelming majority. The vote for presidential electors was as follows: Democrat 840,151; Republican 199,152; Socialist 728; Communist 212; Prohibition 925. W. Lee O'Daniel was reelected governor in 1940. The opposition to him in the political campaign was bitter but ineffectual. The legislature did not meet during the year because the governor refused to call a special session. During the year the state turned its attention to the problem of national defense. Work was begun on a great army encampment at Brownwood. At Corpus Christi, construction started on a huge air-naval base. The shipyards at Orange received orders to build 12 destroyers.

The legislature met in Jan. 1941 to begin the longest session (170 days, until July 4) and to pass the heaviest tax bill in the history of the state. Little other legislation of importance was enacted, except to repress strikes in defense industries; hostility between the governor and legislature caused frequent impasses. After the death of U.S. Sen. Morris Sheppard in April 1941, the governor called a special election for June 28. Meanwhile, he appointed Andrew Jackson Houston, 87, to the vacant seat. O'Daniel himself announced his candidacy for the office; Senator Houston died in June, and O'Daniel barely defeated Congressman Lyndon Johnson, who had the strong support of the national administration. The three leading candidates were O'Daniel (175,590), Johnson (174,279), Gerald Mann (140,807). Coke R. Stevenson, lieutenant governor, was inaugurated as governor Aug. 8, 1941. Other state officers were Gerald Mann, attorney general; Charley Lockhart, treasurer; Bascom Giles, commissioner of general land office; J. E. McDonald, commissioner of agriculture; L. A. Woods, superintendent of public instruction; George H. Sheppard, comptroller; railroad commissioners, Ernest O. Thompson, G. A. Sadler and Olin Culberson. On Gov. Stevenson's inauguration, H. L. Winfield became acting lieutenant governor.

During 1942 the life and economy of the people of Texas were disrupted by World War II. The rate of enlistments in the armed services was higher than in any other state of the union. War workers crowded cities and towns and there was a scarcity of farm labour. As a result of these disruptions there was a lack of interest in local politics. In the second Democratic primary (in August) U.S. Sen. W. Lee O'Daniel defeated James V. Allred, who had the strong support of the national administration, by a narrow margin (451,359-433,203). Only a minority of qualified voters went to the polls. O'Daniel, after re-election to the senate, led the fight against the drafting of 18- and 19-year-olds. The antiadministration trend in Texas politics was echoed by Coke R. Stevenson (re-elected governor), who protested against rationing, and John Lee Smith (elected lieutenant governor), who criticized federal labour policy. Jesse James was state treasurer in 1942, and James P. Alexander, chief justice of the supreme court.

No general election was held in Texas during 1943, and

there was little political activity or interest. Cities and towns with army camps or defense plants continued to bulge with newcomers. While the people remained apathetic, a strenuous campaign against the national administration and its major policies was carried on by the junior U.S. senator, W. Lee O'Daniel, the governor of the state, Coke R. Stevenson, and the lieutenant governor, John Lee Smith. The only state official of any importance who defended the administration was the attorney general, Gerald Mann. He resigned in December and was succeeded by his assistant, Grover Sellers. (C. W. RA.; X.)

The elections of 1944 resulted in removal of only one incumbent of state office. Judge Richard Critz (Dem.) of the state supreme court was defeated by Lt. Col. Gordon Simpson (Dem.), who served in Italy during the campaign. The chief political development was the split of the dominant Democratic party over the fourth-term nomination of President Roosevelt. The election poll was 821,605 for Roosevelt; 135,439 for the Democratic "regulars" or anti-Roosevelt ticket, with uninstructed electors, and 191,-425 for Thomas Dewey (Rep.). A bitter controversy developed during 1944 over differences between the board of regents of the University of Texas and its president, Dr. Homer P. Rainey, who was removed from office Nov. 1, after which three board members resigned. Principal state officers for the official biennium beginning Jan. 1, 1945, in addition to Governor Stevenson, were: lieutenant governor, John Lee Smith; secretary of state, Claude Isbell; comptroller, George H. Sheppard; attorney general, Grover Sellers; treasurer, Jesse James; superintendent of public instruction, L. A. Woods; state land commissioner, Bascom Giles; chief justice, James P. Alexander; railroad commission, Olin Culberson (chairman), Beauford Jester and Ernest O. Thompson.

The closing of large ordnance, aircraft and shipbuilding plants, built for war production, was the outstanding event of 1945, causing some redistribution of population and lessening of drastic labour shortage. The only state election in 1945 was on Aug. 25, when three constitutional amendments were adopted, increasing the supreme court from three to nine members; providing for soldier voting without poll tax for a limited time after the war and giving state agencies wider discretion in distribution of social welfare benefits; one amendment, increasing legislative pay, was defeated. Submission of these amendments was the principal permanent result of the 49th legislature in biennial session Jan. 2-June 5. The controversy over control of the university continued during 1945 with the institution placed on probation by the Southern Association of Colleges and Secondary

The year 1946 was characterized in Texas by continued postwar readjustment of industry, with a consequent reshifting of population to the rural areas, although the 500,000 who migrated to the cities during the World War II period still remained largely concentrated there. There was no session in 1946 of the biennial legislature.

Political interest centred in the gubernatorial race in the 1946 Democratic primaries; Beauford H. Jester was nominated in the runoff primary, defeating Homer P. Rainey by a vote of 700,178 to 361,178. Nomination as usual was equivalent to election. There was intense public interest in the campaign because it was the culmination of a controversy between Rainey, who was deposed as president of the University of Texas in 1944, and the university board of regents. At the general election on Nov. 5 and at a special election on Nov. 7, four constitutional amendments were adopted providing for (1)

issuance of \$25,000,000 in state bonds to assist war veterans to buy farms; (2) a pension system for state employees; (3) restriction of revenue from the gasoline tax to use in highway construction; (4) payment to a construction contractor for a state building whose contract had been voided by court decision.

In addition to Gov. Jester, principal state officers for the biennium beginning Jan. 1, 1947, were as follows: Allan Shivers, lieutenant governor; Price Daniel, attorney general; George H. Sheppard, comptroller of public accounts; Jesse James, treasurer, and L. A. Woods, superintendent of public instruction. (S. McG.; X.)

Textile Industry

The decade 1937-46, which left no part of the world economy unchanged, had a more profound relative effect upon the textile industry than upon industry in general. The full significance of those ten eventful years in textiles was not immediately apparent to the general public,

> or even to textile manufacturers themselves.

U.S. Activity.-The sharp extremes of fortune were accurately portrayed in the statistical picture for the decade. Textile-mill activity in the United States started the period in 1937 at a level well above that of the depression years, dropped sharply in 1938 to depression levels as the 1936-37 boom came to its abortive end, and then started climbing to an unprecedented volume of activity which was still in effect at the end of the decade. The result was that the bulge starting with the U.S. defense program became a boom in the years of World War II and continued so in the immediate postwar years. The activity index from 1941 to 1946 inclusive was more than 75% above the assumed prewar normal.

The decade brought sharp changes in the alignment of the major raw materials. Silk passed out of the picture well before Pearl Harbor. Completely new types of synthetic fibres, best exemplified to the general public by nylon, posed new threats not only to the natural fibres but to the old-line synthetics. However, here too World War II arrested the full manifestation of these changes. Military needs and devastated countries combined to make every pound of raw material valuable and the "Battle of the Fibres" was postponed by events on the world's battlefronts. Natural fibres, which might

have receded sharply in a world percentage scale, rose instead as war took its toll of man-made fibre production in the countries in the war zones. The following figures from the Rayon Organon, published by Textile Economics Bureau Inc., show this shift: In 1937 the first year of the decade, cotton accounted for 81% of world production of the 4 major textile fibres; wool 10%, rayon 8% and silk 1%. In 1941 synthetics had made inroads on cotton, with the resulting alignment as follows: cotton 69%, wool 14%, rayon 16%, silk 1%. In 1945 the trend had been partly reversed with this result: cotton 75%, wool, 15%, rayon 10%, silk none.

The global nature of World War II created new textile needs for which entirely new types of research were necessary. Fabrics were required for use in the stratosphere, on the ground and under the sea; in the arctic regions and in the tropics; in the desert and in swamps; against possible use of gas and other weapons. To meet these needs, research was conducted under government auspices, by textile institutes and associations, and by corporations.

Prior to World War II, there were undercurrents of reform which were gradually removing textile manufacture from its relatively low place in public esteem to the status of a higher-wage industry. The most important single force in that direction was the inauguration of minimumwage and maximum-hour legislation, which became effective in the United States in the fall of 1938. Also, the

Textile worker winding nylon yarn around bobbins. Nylon hosiery first went on general sale in the United States May 15, 1940, but production was severely curtailed during World War II and the immediate postwar period

acute manpower shortage throughout the years of World War II and in the immediate postwar years pushed wage levels still higher and brought new gains for labour. Although to many the pendulum may have seemed to swing too far in the other direction, the net result of the long-term trend should be of help to the ethical and progressive manufacturer.

The most important question at the end of the decade, not only from the standpoint of the textile industry itself but from that of the general public, was the effect of competition from other industries and other countries for markets hitherto supplied by the United States textile indus try. Inroads by other products-particularly paper-were made before World War II. Textile manufacturers recog nized that the only real defense was research. Similarly, competition from newly industrialized countries posed an other threat to the textile industry of the United States. It was quite possible that the latter would have to retreat gradually from the manufacture of cheap, staple fabrics, leaving that field eventually to countries with lower wage levels and standards of living, and resorting more and more to the production of specialized fabrics with higher mar gins of profit. This possibility was not a threat to the alert sections of the industry. For the general public, it promised more and more intrinsic value for the dollar spent on fabrics, no matter what country or what type of enterprise produced them. It could be concluded, therefore, that the ten eventful years were most important because of the groundwork which had been laid.

(D. G. Wo)

Great Britain and Europe.-Before 1937 viscose, cuprammonium and cellulose acetate, the three main types of rayon, had found extended use. They were, however, defective in possessing a rather low strength (from 2.0 to 1.3 grams per denier) and in showing too great a loss in strength on immersion in water. In the case of viscose rayon, improved methods of spinning raised the strength to 3.5 grams per denier and reduced the loss in strength in water to 35% compared with 50%. Such material was marketed in Great Britain under the name of "Tenasco." Even greater strength, though accompanied by a small extensibility, was obtained by development of the Lilienfeld process. The yarn, known as "Durafil," had a strength of 5.5 grams per denier, but the extension at break was only 7%. In the case of cellulose acetate rayon, strong yarn, marketed under the name of "Fortisan," was obtained by stretching the filaments in an atmosphere of steam to induce molecular orientation, and then hydrolyzing the product to regenerate cellulose and increase molecular cohesion.

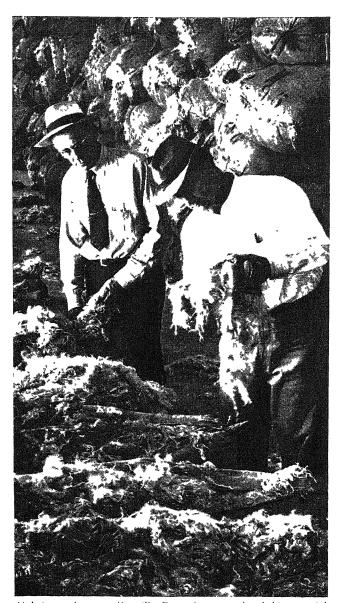

In ways such as these, the elastic properties of ordinary rayons were modified, particularly in the direction of increasing their strength, to meet a number of industrial requirements. During World War II both "Tenasco" and "Fortisan" found important military uses; e.g., in the manufacture of tire cord for the reinforcement of aeroplane and motor car tires. At the same time as these developments were taking place, further attempts were made to modify the properties of viscose rayon so as to give it an affinity for acid wool dyes. For this purpose, synthetic resins were either incorporated in the spinning solution or applied to the rayon after spinning. A German product of this type was "Vistralan," while the British product was "Rayolanda."

A different approach to the problem of making rayons to imitate the properties of animal fibres like wool was made by Antonio Ferretti in Italy. He chose casein, which had long been used in the manufacture of plastics, as the raw material, and by the discovery of correct methods of isolating, dissolving and spinning the casein he was able to produce usable textile fibres. Their strength was only 0.8 grams per denier, and the loss in strength in water was as much as 60%, but satisfactory fabrics were obtained by blending the cut fibre with an equal or greater amount of wool. The low wet strength of the material was also turned to advantage in the manufacture of felts, particularly felt hats, because mixtures of casein staple fibre and wool or fur were found to felt more rapidly than wool alone. Fibres of a similar type, known as "Ardil," were made from the proteins of ground nuts in Great Britain.

The closest imitation of silk, both in appearance, strength and dyeing properties, came with the production of nylon in the United States (see above). Its manufacture in Great Britain during World War II was restricted to war purposes, such as parachute fabric and tow ropes for gliders. There were repercussions in Germany, where a synthesis of nylon-like fibres was worked out. Marketed under the name of "Perlon L," the rayon had the same high strength as nylon and possessed affinity for the same types of dye. Among other fibres developed in Germany were "Perlon U" (polyurethane) and PE-CE (chlorinated polyvinyl chloride). Processes were developed in Germany for the continuous production of viscose rayon. These, with Courtauld's process for making "top" directly from continuous filament rayon by means of an ingenious cutting device, did much to cheapen and increase the utilization of viscose staple fibre.

An interesting development in Great Britain during World War II was the attempt to produce satisfactory 1ayon from seaweed. Sodium alginate, obtained from seaweed by extraction with a solution of sodium carbonate, was dissolved in water and extruded into an acid solution of calcium chloride. The resulting calcium alginate rayon was lustrous, slightly stronger than ordinary viscose rayon and could be readily knitted or woven. It was, however, soluble in alkali. The defect was overcome by replacing all or part of the calcium by chromium or beryllium, or by treatment with an acid solution of formaldehyde. Actually, the alkali-soluble type of rayon was found to be more important than the alkali-resistant types, because it was the only one of its kind. Its uses were multitudinous. Calcium alginate fabric was, for example, used as a foundation fabric on which other yarns were embroidered; when the embroidered fabric was washed in a solution of soap and soda the alginate rayon dissolved and left the embroidery isolated.

Although the most striking advances were in the field of rayon production, considerable progress was made in the modification of natural fibres. The discovery of the main features of the constitution of wool in 1933 had given rise to constructive attack on many problems, notably that of preventing the felting and shrinking of wool textile materials during laundering. Most of the work in this field was carried out in Great Britain, and the processes included treatment of wool with a solution of sulphuryl chloride in white spirit, a dispersion in white spirit of a solution of sodium hydroxide in butyl alcohol and an acid solution of potassium permanganate. All these processes were used commercially, and a number of others, based on the formation of polymers inside and outside the fibres, were carried to the point of commercial development. Similarly, in the case of cotton, the war in the Pacific gave an impetus to research on the proofing of cotton uniforms and equipment against attack by bacteria and fungi. Several successful processes were evolved. Of special impor-

Mohair warehouse at Kerrville, Texas. Large stocks of this material, formerly used in U.S. motor car upholstery, were used to help ease the wartime wool shortage

tance, too, was the "ventile" fabric from which portable and collapsible containers for water were made. (See also Chemurgy; Cotton; Interior Dicoration; Rayon and Other Synthetic Fibres; Wool.)

Theatre

No Sophocles, no Shakespeare emerged to make the native American drama momentous during the decade surveyed in these volumes. True, Eugene O'Neill broke his 12-year silence in 1946 with a lengthy, eloquent and often exciting examination of the dreams and illusions of bar-

room riff raff which was strangely entitled *The Iceman Cometh*, there was poetry by stealth in the often lyrical realism of Tennessee Williams' *The Glass Menagene* (1945) and in 1943 *Oklahoma'*, the folk comedy with mu sic by Richard Rodgers and a libretto adapted from Lynn Riggs' *Green Grow the Lilacs* by Oscar Hammerstein II, set new pace and pattern for the music show with antiph onal ballets. Yet had William Gillette lived another ten years, that distinguished playwright and actor could have uttered again the humorously truthful words he wrote shortly before his death in 1937 "I have the honor to report that the American theater is still declining"

The financial depression was still felt when this period began Hundreds of unemployed actors were given at least a subsistence wage in the Federal Theatre project con trolled by the Work Projects administration. There may have been more heart than art in this worthy govern mental experiment greater relief for the player than for the playgoer, but when in 1939 the Federal theatre expired in its fourth year, there remained encouragement for a noncommercial enterprise entitled. The American National Theatre and Academy, with a federal charter

The theatres of the United States experienced an abrupt boom directly World War II had started even before Americans had been called to arms. This boom grew de spite not only a shortage of theatres (they had been snapped up for motion picture houses during the depres sion), but a shortage of playwrights and players who had transferred their talents to Hollywood many later engag ing in war work at home and abroad Countless inferior plays were produced but without retarding the public's reawakening to the pleasures of beholding living actors rather than their animated photographs Some of the nightly plays were almost as contemporary and short lived as the daily newspapers Money was spent on production and at the box office as never before The more success ful New York productions lasted so many seasons that duplicate casts were engaged for Chicago and the road But failures still numbered four against one success and in the absence of tempting scripts many revivals were staged not only of yesterday's popular pieces, but of day before yesterday's Shakespeare was again the first play

Many an unstageworthy comedy or drama died obscurely in what Variety, the nation's leading amusement weekly termed 'straw hat production at the summer theatres that mushroomed throughout the countryside and the suburbs of the eastern states the audiences preferring revivals of Broadway and national hits. In the metropolitan theatres were staged a few plays with no scenery and few props. Orson Welles made a sceneryless presentation of Julius Caesar without togas. Thornton Wilder's principal properties for the bare staging of his Our Town (an amiable reflex from the bitter elegy of Edgar Lee Masters' Spoon River Anthology) were an array of umbrellas opened against the rainless rain of the burial scene which would have brought down the final curtain had a curtain been in use

'Movie money' moved in and out of the living theatre It had moved in again in 1946. Hollywood writers tackled the stiffer obstacles lying behind the footlighted prosce nium, and a mournful statistician counted in 1 year 39 failures in 40 attempts. The "colour question" was presented with heated partisanship by some of the play wrights, and these checkerboard dramas increased the at tendance of Negro playgoers, as did Shakespearean revivals

which included Paul Robeson's appearance as Othello and Canada Lee's as Caliban, not to overlook I thel Waters emergence as a dramatic actress in Mamba's Daughters. There were a number of Negro casts ranging from Orson Welles. Haitian version of Macbeth to Anna I ucasta. Philip Yordan's workmanlike play originally written with Polish American characters before the script fell into the capable hands of New York's American Negro the ure and was profitably snapped up by commercial maingement. Plays in protest against anti-Semitism appeared near the end of the decade but none was written with the avowed impartiality of Galsworthy's remembered I oral ties they were more justly indignant than dramatically significant.

With the appearance of the amazingly popular Junion Miss, there came at least a dozen comedies of adolescence that prematurely aged those veteran critics who had not found relief in war work or foreign correspondence but which greatly pleased not only youngsters temporarily weaned from the movies but a vast number of adults who seemed happy to find their second childhood in what several of the more morose reviewers dubbed 'draper drama'

Politics took to the stage in jest and in earnest and the cream of political persifiage was George M. Cohan's (he died in 1942) song and dance impersonation of the living Pres. Franklin D. Roosevelt in I d. Rather Be Right in 1937. A more serious and yet richly amusing consideration of the political scene was 1945's State of the Union in which Howard Lindsay and Russel Crouse authors of the durably laughable Life With Father, satirized not only the conflict between political idealism and bossism but id monitory preachments written along that line. One of the more serious admonitory dramas was novelist Sinclui Lewis' warning against fascism in America, bearing the ironic title It Can't Happen Here and produced in 1936 throughout the country by 18 units of the Federal The tite project.

Most of the war plays were precipitously propagandic and it was recalled that America's What Price Glory? came six years after World War I and England's Journey's End ten years Black was very black and white very white and there was hardly any gray in these abrupt and one sided dramatic editorials Robert E Sherwood's flucht There Shall Be No Night lost nothing of its popular ip peal even when a disturbance in contemporary history made tactful the change of scene from Finland to Greece But the war plays of any quality were the lightheartedly messageless rather than the heavily loaded propagandist and among these were Paul Osborn's dramatization of the John Hersey novel, A Bell for Adano, John Patrick's The Hasty Heart, S N Behrman's adaptation of Franz Werlel's Jacobowsky and the Colonel and a sprightly revue with ten by young war veterans on the matter of reconversion and tellingly called Call Me Mister

Shakespeare Redivivus.—While many of the better Amer ican playwrights served their country or Hollywood there was always Shakespeare. As in previous periods productions of his plays outnumbered those of any other author dead or alive. There were Shakespearean revivals lavish and sparse. The night following Orson Welles' presentation of Julius Caesar in mufti. Tallulah Bankhead appeared at a nearby New York theatre in the costliest An tony and Cleopatra ever staged. It lasted five nights

But a brief run did not always mean a bad performance One of the best was Welles' telescoping of the Henry his tories under the title of *Five Kings*, in which his wine stained and greasily gutteral wencher was reckoned the ripest and most richly humorous Falstaff of the 20th century by critics fortunate enough to witness the too few per formances played only in Washington D.C. The Falstaff of Ralph Richardson was widely acclaimed when Richard Aldrich, husband of Gertrude Lawrence brought from London to New York under guarantee, the Old Vic company for a repertory season of six weeks. Here Laurence Olivier—whose Romeo, like Vivien Leigh's Juliet had met emphatic failure first in Chicago and then in New York several seasons earlier—was welcomed as the right man for Hotspur in the opening half of Henry IV and declared by many reviewers to have attained to little short of great ness when he assumed the name part in the rarely seen translation of Sophocles' Oedipus, originally made by W B Yeats for Dublin's Abbey Theatre

Domestic and imported actors measured their skills in Hamlet Maurice Evans well played the first unabridged Hamlet since, following the turn of the century Ben Greet had survived a Hamlet without cuts in the University of California's vast open air Greek theatre at Berkeley Near the close of the decade Evans staged for the armed forces at home and abroad a severely shortened Hamlet in cos tumes of the 19th century (including swords) which was somewhat expanded later when Michael Todd took it over as a commercial enterprise Leslie Howard's Hamlet was more reflective than urgent John Gielgud's was declaimed in the old tradition that had been followed by Edwin Booth's contemporaries, but not by Booth

Evans was the most tueless of the Shakespeareans In and as Richard II he gave his most rounded and mag netic performance. In Macbeth his thane was dimmed by the luminous power of Judith Anderson's Lady Macbeth His deliberately cockneyed Malvolio to Helen Hayes' ardent Viola in the guild's Twelfth Night was good fun, good theatre, good acting But his Falstaff in Henry IV, Part One, was mediocre The versatile Miss Hayes had her first experience in Shakespeare in Chicago when she re lieved the hard routine of Victoria Regina with special performances of The Merchant of Venice Notwithstand ing uncouth criticism that called her characterization 'a half Portia," the true comic spirit gleamed throughout the diminutive actress' portrayal Walter Huston, a stalwart among American character actors but unschooled in verse drama, gave up Othello after 21 Broadway performances Paul Robeson's attack on this role which he had first acted in London a decade earlier, was more popular in New York and other large cities although his charac terization was singularly lacking in passion here the critical posies were bestowed on the Iago of Jose Ferrer

The road witnessed its liveliest Shakespeare when Alfred Lunt and Lynn Fontanne, with an excellent company and a most artistic yet inexpensive production left New York and toured from coast to coast in a riotously comical performance of The Taming of the Shrew Another 'grand tour" was made in the earliest of these days by Katharine Cornell when she duplicated throughout the country the New York success of her Romeo and Juliet, the poetic spell of her Juliet intensified by the highly emo tional Romeo of Maurice Evans and the dazzlingly brilli ant Mercutio of Ralph Richardson Two comparatively unfamiliar revivals were The Tempest and The Winter's Tale In the former the versatile Negro actor Canada Lee put forth a Caliban whose speeches were more believable than his makeup, and in which the comely dancer Zorina as Ariel, was more poetic to the eye than to the ear The Theatre Guild's Tale was magnificent scenically but even with such veterans as Jessie Royce Landis and Florence Reed the acting did not overcome the play's traditional lethargy And late in 1946 the newly organized American Repertory company started in Princeton N J a well received *Henry VIII* with interpolations credited by Director Margaret Webster to the Holinshed chronicles

Other Revivals - Larly in this decade a few plays of the Elizabethan and Restoration periods were revived Welles acted the titular character in Christopher Mailowe's Doc tor Taustus for New York's Federal theatre, seats selling for as little as 25¢ and no higher than 50¢. His and John Houseman's short lived Mercury theatre made a rollicking production of Thomas Dekker's The Shoemaker's Holiday Ruth Gordon, who had prepared for the job by working with the Old Vic actors in London was as Mrs Pinch wife the high condiment in Gilbert Miller's staging of Wycherly's The Country Wife The scarcity and medi ocrity of new scripts encouraged the revival of successful plays of previous periods Ibsen's Hedda Gabler, Ghosts and An Enemy of the People swiftly appeared and dis appeared But where Alla Nazimova Walter Hampden and others failed to repopularize Ibsen the saline Ruth Gordon's 1937 reconsideration of his new woman gave new life to the great Norwegian's A Doll's House Anton Chek hov's work was enthusiastically revived with compelling casts The Lunts following a Russian pilgrimage to the Moscow Art theatre, valuantly forsook comedy for a solemn and successful disinterment of The Sea Gull Miss Cornell sharing honours with Miss Anderson and Miss Gordon in the title parts and supported by a company of unchallenge able calibre directed by Guthiie McClintic, gave The Three Sisters the most satisfying examination it had re ceived since Morris Gest imported the original Moscow cast Eva LeGallienne and Joseph Schildkraut had a lop sided revival of The Cherry Orchard owing to uneven acting by their support and bits of avowedly comical stage business that provoked in the audience more embar rassment than mirth

Miss Cornell, whose Candida in Bernard Shaw's comedy of that name was first essayed in 1924 and repeated in 1937 became its classic interpreter when in 1942, she revived the play in New York for the Army Emergency fund and Navy Relief society with a notable cast. Miss Cornell offered still another Candida revival in 1946 (her gallant experiment with Lewis Galantiere's adaptation of Antigone failing to attract large audiences) in which Sir Cedric Hardwicke acted an elaborately low comical Burgess. In 1941 she presented The Doctor's Dilemma for 121 performances in New York a duration record for a Shaw revival that was broken only when Gertrude Lawrence testored Pygmalion to the American theatre in 1946.

Oscar Wilde's The Importance of Being Earnest was seen again in 1939 with Clifton Webb and Estelle Win wood and in 1946 his Lady Windermere's Fan was sumptuously staged (there was even an original score of incidental music) for national consumption in San Francisco

In 1937 Dublin's still intact Abbey theatre company toured the United States in a familiar repertory W S Maugham's The Circle was revived the following year with Tallulah Bankhead and Grice George Sean O Caseys Juno and the Paycock ran to much acclaim. In 1942 Paul Muni returned to the role he had originated in Elmer Rice's Counsellor at Law. After playing Rudolph Besiers The Barretts of Wimpole Street for the US armed forces in Europe in 1945. Miss Cornell gave the play back to the civilians of New York. The following year was marked by successful revivals on Broadway of Ben Hecht and Charles MacArthur's hilariously cynical. The Front Page,

and the Brian Hooker translation of Cyrano de Bergerac, acted and produced by José Ferrer.
